33. You might say his business life depends on the skill of his own two hands.

34. But now he must depend on the hands of others, especially those of his wife.

35. He must have complete rest for several months. Even, then, he may not be able to continue being a dentist.

    Today, Dr. Brennan's office is empty. His income has disappeared.

    And his <u>own</u> expenses will be both prolonged and heavy.

36. True, the Brennan bank book shows a sizeable balance.

37. But these savings alone couldn't maintain the Brennans for very long... even at reduced living standards.

38. Could this mean that the Brennans will have to sell their lovely home?

39. These problems are on Dr. Brennan's mind although he knows worry slows recovery.

40. What form of protection might Dr. Brennan have had to free him from financial worries?

41. Now you've seen how sickness and accidents can affect your lives.

    And you should be aware of some of the ways to provide the necessary dollars for health.

42. What types of health insurance policies would have been best in each of the cases in the film?

    Should health insurance be purchased to cover all possible medical expenses? Or should it cover only serious sickness and accidents? What are some of the factors to be considered when deciding?

    What organizations provide protection against the costs of hospital, medical care, and the loss of income?

    Help in answering these questions is available from many sources, including the Health Insurance Institute and the Educational Division, Institute of Life Insurance.

SECTION ONE: ALLOCATION OF RESOURCES
UNIT X: Insurance
X-5. What Have We Learned About Insurance[1]

(See Suggested Learning Experience No. 26, p. 58 in Part One)

Matching Items

Directions: There are four basic types of life insurance policies: (a) term, (b) straight life, (c) limited payment, and (d) endowment. Answer each question below by selecting one of these basic types and writing the letter that precedes your choice in the answer space provided.

_____1. Costs less than the other three types.
_____2. Has a cash value at maturity equal to the amount of insurance purchased.
_____3. Is the most flexible.
_____4. Premiums are payable as long as the insured lives.
_____5. Savings values increase most rapidly.
_____6. Premiums are paid for a stated number of years, after which the policy is paid up for life.
_____7. Has no cash value.
_____8. The cheapest form of permanent insurance.
_____9. Is considered temporary insurance.

Situation Analysis Items

Directions: Each of the four basic types of life insurance policies (term, straight life, limited payment, and endowment) has special features designed to serve specific purposes. For each situation described below, indicate which basic type would be most suitable. Write your choices in the answer spaces provided.

10. A high school student who has no insurance.

_____

11. A policy taken when a child is five years of age to help finance his college education.

_____

12. The head of a family who has borrowed a large sum of money which he is to repay over the next five years.

_____

13. A professional man age 45 whose children are grown and who earns a large income and who is more interested in protection for his wife than in retirement for himself.

_____

[1]Reprinted from Policies for Protection. New York, New York: Institute of Life Insurance. pp. 26-27.

14. A man age 30 who already has $20,000 of straight life and who has just bought a home with a $10,000 mortgage on it.

_____

15. A businessman whose family is grown, who plans to retire in a few years and is largely concerned with building up as much retirement income as possible.

_____

Rating Scale

Directions: Below are several statements pertaining to the various aspects of insurance you have studied. For each statement indicate the degree to which you agree or disagree with it by writing the appropriate letters (SA-A-D-SD) on the short line following the statement. Then using the lines beneath the statement, justify your position, giving reasons to support it.

SA--strongly agree
A--tend to agree
D--tend to disagree
SD--strongly disagree

16. The amount every wage earner should spend for insurance protection is 10 per cent of his income. _____

_____

_____

17. The typical family can wisely buy as much insurance as it can afford. _____

_____

_____

18. The head of a family should buy all types of insurance. _____

_____

_____

19. Everyone should study his economic risks carefully and purchase first the insurance protection he needs most. _____

_____

_____

20. Most persons should buy straight life insurance because it is the cheapest form of permanent protection. _____

_____

_____

21. Young married men should buy limited payment life insurance so they won't have to pay premiums during their retirement years. _____

_____

_____

WHAT HAVE WE LEARNED ABOUT INSURANCE?

Answer Key

DIRECTIONS: Check your answers to each of the items numbered below.

Matching Items (p. 176)

1. A
2. D
3. B
4. B
5. D
6. C
7. A
8. B
9. A

Situation Analysis Items (pp. 176-177)

The answers given here are recommended. Without more information, it is possible to give logical reasons for other answers.

10. Straight life
11. Endowment
12. Term
13. Straight life
14. Term
15. Endowment

Rating Scale

Either "disagree" or "strongly disagree" may be accepted for questions 16, 17, 18, and 21. Questions 19 and 20 may be marked "agree" or "strongly agree."

16. D or SD The amount of insurance purchased depends upon individual and family needs.

17. D or SD Consultation with an insurance agent is strongly recommended.

18. D or SD The types of insurance policies purchased depend upon individual and family needs.

19. A or SA Each family should set its own priorities.

20. A or SA It is difficult to generalize, but this is the "all purpose" type of life insurance.

21. D or SD They may have great need for protection now. The money which they can set aside for premium payments would buy more permanent protection if they purchased straight life instead of limited-payment life.

SECTION ONE: ALLOCATION OF RESOURCES
UNIT X: Insurance
X-6. Crossword Puzzle on Insurance[1]

(See Suggested Learning Experience No. 27, p. 58 in Part One)

ACROSS

1. Type of life insurance that amounts to an insured savings plan.
2. The least expensive type of permanent protection in life insurance is _____ life.
4. A person who has insurance.
8. Disability insurance pays for loss of _____.

---

[1] Reprinted from Policies for Protection. New York, New York: Institute of Life Insurance. p. 24.

9. Hospital, surgical, and _____ insurance are often called basic health coverage.
11. Type of life insurance policy that protects for a given period of years.
13. A provision that under certain conditions an insurance policy will be kept in full force by the company without the payment of premiums is called a _____ of premium.
15. A family income _____ may be added to a straight life policy.
16. An insurance contract.
17. Life Underwriters Associations are organizations of insurance _____.
22. Having insurance gives one a feeling of _____.
23. Insurance companies help finance home and apartment buildings by investing in _____.
24. A means of sharing risks.
25. A permanent life insurance policy has a _____ value, which the policyholder may borrow against.
26. A double indemnity policy pays double when death results from _____ means.

DOWN

1. Type of risk that may cause financial loss.
3. Type of insurance plan often provided by a wage earner's company.
5. The insurance company puts money to work in _____.
6. The two types of personal insurance are life and _____.
7. The type of insurance premiums are paid for a set number of years but protection lasts for life is called _____ payment.
10. Type of insurance that protects against the claims of other people if the insured person should injure them or damage their property.
12. Charges for insurance are known as premium _____.
14. Amount paid for insurance.
18. Overhead insurance is a type of _____ health insurance.
19. Chance of losing something of value.
20. Surgical _____ insurance is a type of health insurance.
21. All permanent life insurance has _____ values. This means that insurance protection need not be given up to get the use of cash in an emergency.

SECTION ONE: ALLOCATION OF RESOURCES
UNIT X: Insurance
X-7. Insurance Jeopardy[1]
Allan Vogelsang
(adapted from TV to teach insurance)

(See Suggested Learning Experience No. 30, p. 58 in Part One)

Preparation required: Construct a large board with hooks on which to hang cards (about 4' x 4'). Cards have a score on one side and a question or an answer on the other. Scores range from 10 to 60 under each category, and questions become more difficult as scores increase. A skillful teacher might construct questions in the six levels of the cognitive domain[2]: repeating knowledge learned, stating knowledge in own words, applying knowledge, analyzing, synthesizing, and evaluating. Several questions at each level under each category will be needed. In this game, the categories of insurance are automobile, home and property, health, and life.

The class may be divided into three (or more) teams and each team member given a noise maker with which to signal his readiness to answer the questions. The members of one team may have whistles, another bells, and the third snappers. In this way, it can easily be determined which team signaled first.

Rules of Play: Some means of determining which team will select the first questions is decided upon, e.g., "Guess a number between 1 and 10," or draw slips of paper marked 1, 2, and 3.

The first team chooses a category and a level, e.g., auto at 10. That card is turned over for all to see (or it is read aloud) and anyone who thinks he can answer the questions (or, in this case, provide the question which fits the given answer) signals with his noisemaker. The first to signal is given a try. If correct, his team scores that amount (in this example, 10); if not, his team has that amount subtracted from its score.

If answer is correct, that team chooses another category and level, e.g., health at 30. If incorrect, other members may signal immediately to have a try.

---

[1]Reprinted from Illinois Teacher for Contemporary Roles. Urbana, Illinois: Division of Home Economics Education, University of Illinois, Vol. XIII, No. 2, November-December, 1969. pp. 66-67.

[2]Bloom, Benjamin et al., editors. Taxonomy of Educational Objectives: Cognitive Domain. New York, New York: David McKay Company, Inc., 1956.

Play may continue until all cards are turned over or for a specified time. Team scores determine the winner.

The game may be used for review or evaluation without resources, but if used in the beginning of the insurance study, an assortment of bulletins, books, posters, charts, etc., should be available from which students can discover needed information. Time limits would need to be longer in this circumstance.

SECTION ONE: ALLOCATION OF RESOURCES
UNIT XII: Taxes--I.Q. Pre-Test

(See Suggested Learning Experience No. 1, p. 65 in Part One)

Answer the following questions:

1. Who pays for public services such as the library and park?
2. What are some of the different taxable items you purchase?
3. What benefits and services do the taxes from these items provide you?
4. Who picks up the litter on the highways? Who pays for this service?
5. From where does the money come for those people who receive welfare payments?
6. Who decides what the local school tax will be?
7. What local services are provided as a result of taxes?

SECTION TWO: CONSUMER BUYING
UNIT II: Cooperatives
II-5. Consumer-Sponsored Services

(See Suggested Learning Experience No. 8, p. 76 in Part One)

1. Consumer's Research, Inc.--outgrowth of what was originally a small club for the study of consumer goods. Now a national organization, nonprofit corporation, with extensive laboratory testing facilities. Subscribers are not members, but purchasers of periodical literature. Large staff of professional research and technical personnel who test and rate the efficiency of consumer products through scientific testing methods; develop testing methods and procedures; advise educators in the economics of consumption; provide consulting services on technical problems for consumers, government agencies, and others; and publish monthly and annual reports (Consumers' Research Bulletin) on products. Products are listed by name as recommended, intermediate, or not recommended and price level is indicated as low or high. (Washington, New Jersey 07882)

2. The American Council on Consumer Interests--nonpartisan, nonprofit organization serving consumers primarily through the publication of a series of booklets dealing with vital issues. Typical titles: Consumers Look at Fair Trade, What You Should Know About the Law of Estates, Consumers Look at Antitrust Laws. Publishes newsletter and Consumer Education Forum, serves as clearinghouse for consumer information materials, and conducts annual conference devoted to consumer problems. (15 Gwynn Hall, University of Missouri, Columbia, Missouri 65201)

3. Consumers Union of United States, Inc.--nonprofit organization. Purposes are (1) to provide consumers with information and assistance on all matters relating to consumer goods and services; (2) to give information and assistance on all matters relating to expenditure of family income; (3) to initiate and to cooperate with individual and group efforts that seek to create and maintain acceptable living standards. A large technical staff is employed in laboratories, and part-time shoppers buy sample products to send to the laboratory for testing. Ratings of products are based on laboratory tests, controlled-use tests, and expert opinion or experience or a combination of these factors. They publish monthly and annual reports on tests of products in Consumer Reports. Brands are grouped as acceptable and not acceptable. (Mount Vernon, New York)

4. Consumer Cooperatives--groups or organizations established to provide goods or services at lowest possible cost without sacrificing quality. They operate for benefit of their members as individual consumers. They subscribe to certain basic principles: (1) membership is open to any person, (2) each member has only one vote regardless of how much he has invested, (3) no profits are permitted, (4) members should obtain the best possible product or service at the most economical price, and (5) maximum information regarding products or services should be given to all members.

5. The Cooperative League of the U.S.A.--a national federation of cooperatives. Their purpose is to promote cooperatives and the benefits of cooperatives and to maintain an effective consumers' lobby in Washington. Consumers' Lobby is published monthly and is available at no charge to

persons who can produce concrete evidence of having communicated with their congressman or senator at least once during a three-month period. It contains reports on impending legislation and advice on steps deemed appropriate on the consumer's part.

6. National Consumers League--is supported by dues and contributions from its members. Its purpose is to promote legislative action in the interest of consumers. It has supported the efforts for pure foods and drugs, drug safety and efficacy, truth-in-lending, truth-in-packaging, and better health insurance. Publications include "Fact Sheets," legislative alerts, and information regarding other consumer protection needs. (Washington, D.C.)

7. Consumer Federation of America--was chartered in 1967 and employs a full-time executive director. Voting members are city, county, regional, state, and national consumer organizations, whereas nonvoting members are state or national consumer-oriented organizations sympathetic to the work of CFA, such as trade unions, state organizations, and national organizations such as the YMCA. It publishes a newsletter, Consumer Action, in which information about pending legislation is described. Another function is to serve as a clearinghouse for an exchange of project information among local, state, and national groups. CFA concentrates on fact-finding and analysis of consumer issues, alerting its member groups, testifying before congressional committees and federal agencies, and providing a voice for all consumers in the nation. (Washington, D.C.)

SECTION TWO: CONSUMER BUYING
UNIT II: Cooperatives
II-6. Professional Organizations

(See Suggested Learning Experience No. 15, p. 77 in Part One)

1. American Home Economics Association--has promoted the education, welfare, and protection of consumers. It supports legislation designed to protect the interests of consumers through (1) establishment of standards of quality and identity; (2) provisions for informative labeling and informative advertising; (3) prohibition of fraudulent practices and sale of harmful goods and services; (4) prohibition of restraints on trade which increases consumer prices. It has published a series of buying guides which are available through Consumer Interests Committee. (1600 20th St., Washington, D.C. 20009)

2. American Medical Association--promotes the improvement of the quality of medical products. Special committees and councils are assigned to test medical products and apparatus. It publishes a monthly periodical--Today's Health, distributes pamphlets, and occasionally sponsors educational radio and television programs. (535 N. Dearborn St., Chicago, Illinois 60610)

3. American Dental Association--protects and informs the public in regard to dental products. The Council on Dental Therapeutics studies products which are claimed to have healing or curative qualities (therapeutic values). After investigation a product may be accepted by the Council, which means it meets certain standards dealing with its composition and the advertising concerned with it. A seal of acceptance may be used by the manufacturer of a product if it has been accepted by the Council, but this does not mean that it is recommended by them. (211 E. Chicago Avenue, Chicago, Illinois 60611)

4. American Association of Nurserymen, Inc.--sets standards for grading nursery stock. (825 Southern Building, Washington, D.C. 20005)

5. National Association of Bedding Manufacturers--recommends standards for mattresses. (724 9th St., N.W., Washington, D.C. 20001)

6. National Home Study Council--provides information on reputable home study courses. (1601 18th St., N.W., Washington, D.C. 20009)

UNIT II: Cooperatives
II-7. Julie Meets a Salesman[1]
by Lois Guebert

(See Suggested Learning Experience No. 26, p. 78 in Part One)

Julie Smith came home from work Friday evening with her first $60 paycheck. She couldn't have been happier. She had graduated from high school the Friday before and had begun work as a secretary on Monday. Her boyfriend had given her a diamond for graduation, and they were planning to be married the next summer.

Julie's parents were very proud of her and delighted about the engagement. They had known David, her fiance, for several years. They immediately announced her engagement in the local newspapers. As soon as the announcement appeared in the paper, Julie began to get mail on special offers, bargains, and insurance plans. Since none of this seemed to be interesting reading, she rapidly threw it away.

One Saturday about a month later, when Julie was home alone, the doorbell rang. There stood a very nice looking young man in a dark business suit.

"Hello, are you Julie Smith?" said the man.

"Why, yes. Can I help you?" said Julie, quite surprised that he knew her name.

"I saw in the paper that you will be getting married soon and I have something I'm sure you will be interested in seeing," replied the man. "Have you started on your hope chest yet?"

"Well, just barely," Julie said rather cautiously.

"Do you have a few minutes so that I could show you our special offer?" said the anxious salesman.

"I suppose so," answered Julie, thinking that it wouldn't hurt just to look.

The salesman went to his car and came back with two huge suitcases filled with pots and pans. He then proceeded to explain the advantages of his line of cookware and how a kitchen just wasn't complete without a set, such as he had to offer. He even demonstrated how easy it was to bake a cake in his skillet right on top of the range.

---

[1]Reprinted from Illinois Teacher for Contemporary Roles. Urbana, Illinois: Division of Home Economics Education, University of Illinois, Vol. XIII, No. 2, November-December, 1969. pp. 77-78.

4897

"There are three types of sets from which to choose," he explained. "They begin with the basic set for $150 and the complete set for $300."

"Oh, I can't possibly afford anything like that," said Julie. "I'm trying to save money for our furniture. What would just one small saucepan cost if I bought it alone?"

"Well," he began to stammer a little, "the 2-quart size is $20.00. But don't worry about the money, we'll work out an agreement for payment with you. A down payment of only $10 is all that is necessary. You can pay the rest off in small weekly or monthly payments," he continued. "Your friend, Sally Miller, just purchased this set this morning and I sold three others like it yesterday. Now if you will just fill out this form and decide which set you want, it will be sent to you within a week."

"Now, wait a minute," replied Julie quickly. "I realize that this line is of good quality and may be a good bargain, but I need time to think it over and discuss it with my parents and my finace."

"There's one thing I failed to mention earlier," he said. "If you agree to buy any of these sets today on the first call, you will receive our $30.00 electric fry pan or a four piece starter set of our fine china absolutely free. Now you can't afford to pass that up, can you?"

Julie was really in a state of confusion as to what to do. She had never been faced with a decision such as this before. Much money was involved, and the salesman wasn't giving her any time to think straight. He kept on talking to distract her. However, she did remember her mother always reminding her never to rush into anything unless she was absolutely sure of what she was getting and that it was worth the money. Since she wasn't sure, she told the salesman, convincing as he was, that she wanted to think about it some more and that she would call him if she decided to buy the set.

When he left, Julie looked at the clock. The salesman had spent over an hour trying to sell his product. She smiled and felt proud of herself.

"He didn't talk me into it," she said aloud.

"Into what?" asked her mother, as she walked in the door.

[NOTE TO TEACHER: This story could be followed by a discussion or a role playing session in which the consequences of this decision, and of the alternative decision of buying the cookware, are brought out. The contract Julie refused to sign could be shown. Follow-up activities could include role playing with a vacuum cleaner salesman, a brush salesman, and other door-to-door sales people.]

CONSUMER TWO: CONSUMER BUYING
UNIT II: Cooperatives
II-9. Private, Business, and Industrial Organizations

(See Suggested Learning Experience No. 36, p. 80 in Part One)

1. Advertising Federation of America--Proposes to explain advertising to the public; to raise continually higher the standards of truth and good taste in advertising; to help make advertising more effective for business and more useful to the public; to help protect advertising against harmful restrictions and possible taxation; and to encourage improvement in education for men and women in or preparing for advertising careers.

2. American Association of Advertising Agencies--Sets advertising standards and hears complaints on objectionable advertising.

3. American Automobile Association--Lists approved establishments in the travel guides it supplies to members. Maintains a staff of field reporters who inspect and report on hotels, motor courts, restaurants, and other establishments that cater to the traveler.

4. American Gas Association--Tests and certifies more than 95 per cent of all gas appliances sold in the United States and Canada. Certifies that the product meets standards of economy, safety, and durability.

5. American Institute of Laundering--Tests fabrics in goods and ready-made garments for shrinkage, colorfastness, crocking, and other laundering properties. Provides labels of approval which manufacturer may attach to garment or cloth which has passed tests of washability. Issues periodic information bulletins to their members on the care and handling of different fabrics and materials. Operates a training school to prepare people for jobs in the laundering field.

6. American Standards Association--Provides a systematic means among its members for development of American standards. Standards of quality as well as of size and type have been developed.

7. Better Business Bureaus--Improves advertising by eliminating misleading advertising and unethical promotional schemes. Investigates unfair competition among distributors and unfair treatment of consumers. Publishes information booklets for consumers.

8. Better Fabrics Testing Bureau--Tests and rates dye and other properties of fabrics. Provides seals of approval for goods which are satisfactory for the purpose intended. (One applies only to color--Color Tested, the other to more general characteristics.)

9. Electrical Testing Laboratories--Tests and inspects electrical equipment and other products. Awards certification by ETL or by a sponsoring industry group to tested items which comply with certain established standards.

10. Good Housekeeping Institute--Studies and tests products discussed or advertised in Good Housekeeping magazine. Product must meet tests for quality and make truthful advertising claims before it is advertised or given the Consumers' Guarantee Seal which promises that Good Housekeeping will replace or refund purchase cost to consumer if the product or performance is defective.

11. National Association of Investment Clubs--Provides guidance for investment clubs; a nonprofit organization.

12. National Association of Real Estate Boards--Sets up a code of ethics for real estate agents. Members usually display their membership certificate and are permitted to use the term "realtor" in their advertising.

13. National Canners Association--Sets up minimum standards for can sizes, fill, quality, and descriptions of canned products. Association members are encouraged to pack their products in accordance with these standards.

14. National Consumer-Retailer Council, Inc.--Promotes adequate standards for consumer goods and encourages informative labeling and advertising; a nonprofit organization of consumer and retail organizations.

15. National Institute of Dry Cleaning--Tests fabrics in goods and ready-made garments for dry cleaning properties. Provides certification of products which meet their standards. Issues periodic information bulletins to their members on the care and handling of different fabrics and materials. Operates a training school to prepare people for jobs in the dry cleaning field.

16. Nationwide Consumer Institute, Inc.--Tests consumer products, many for Parents' Magazine; a private organization. Arranges with impartial consultants and consumer advisors to test products by use.

17. Nationwide Consumer Testing Institute--Offers manufacturers of consumer products a certification program. Provides Institute's Seal of Quality which may be displayed on products that pass laboratory qualification tests.

18. Parents' Magazine, Consumer Service Bureau--Awards seals to advertisers whose products meet specific standards. Commendation Seal--indicates that the product will perform as advertised. "For Use as Directed" Seal--indicates that the results advertised will not occur unless proper directions are followed. The third seal indicates refund or replacement if the product or performance is defective. Advertiser must apply for the seal which is awarded only after the product has received approval of the Bureau.

19. Underwriters' Laboratories, Inc.--Promotes safety in electrical appliances. Provides label of approval for products which have passed certain safety tests. Sponsored by the National Board of Fire Underwriters.

20. United States Testing Company--Tests a wide variety of products for quality, construction, safety, and use.

SECTION TWO: CONSUMER HOUSING
UNIT IV: Housing and Home Furnishings
IV-1. Your Values in Choosing a Home[1]
by Virginia F. Cutler

(See Suggested Learning Experience No. 5, p. 90 in Part One)

What kind of home would you be happiest in? Would you like to know the answer to this question? Then read the directions carefully in the following pages and do exactly what you are asked to do and when you get to page 206 you will have the answer.

First look through the characteristics of homes below and decide which one you would like best to live in a put a 1 on the line opposite your choice. Look through the list again and write 2 by the one place you like next best. Then look for your third choice and write 3, and keep going until you number <u>every</u> place. There should be 10 numbers.

A home should be:

1. Beautiful _____
2. Comfortable _____
3. Convenient _____
4. In a good location _____
5. Planned for good health _____
6. Place where hobbies or other interests can be followed _____
7. Private _____
8. Safe _____
9. Place where you can share activities with family and friends _____
10. Inexpensive _____

Now we shall tell you more about these homes. Read what it says about every place. When you have finished you will have a chance to vote again.

<u>ONE</u>

This is a beautiful home. It has nice colors and good design. It is good to look at both inside and outside, and fits in with the surroundings. You may not have much chance to carry on your hobbies and may not have much privacy but it is very beautiful.

<u>TWO</u>

This is a comfortable home, a place where you can rest and relax and find relief from strain. It won't be too hot or too cold and will have everything arranged to make you comfortable. It may not be very beautiful and might not be economical but you will have real comfort in this home.

---

[1]Reprinted from <u>Personal and Family Values in the Choice of a Home</u>. New York, New York: Cornell University, Agricultural Experiment Station, Bulletin 840, November, 1947. pp. 8-16.

THREE

This home is convenient; it is neat and orderly, with a place for everything. It has many new labor saving devices. Household tasks and chores may easily be done in this place. You may not like the location and you may not have enough privacy but it is convenient.

FOUR

This home is in a perfect location. It is in a neighborhood that you like and is handy to the places that are important to you. It might not be a very comfortable place nor too safely built but the location is just right.

FIVE

This home is built for good health. It is spotlessly clean and it will be easy to keep clean. There is lots of sunshine, light, and fresh air. It may not be in the best location nor an especially good place for inviting your friends, but it will offer much to keep you well.

SIX

In this home you can putter around and do the things you really like to do. You can carry on almost any personal interest or hobby. It might not be very beautiful nor too safely built but things you like to do in your spare time at home can easily be done in this place.

SEVEN

This home will give each member of the family some privacy. You can do the things you want to do without being bothered. You will have some space that will be your very own. It might not be too well planned for health or convenience but you will have some privacy when you want it.

EIGHT

This home is built for safety. You will feel safe from wind and storm. There won't be much chance of the house catching fire and little chance for accidents. It might not be very comfortable nor too well planned for friendship activities, but you will feel safe in this home.

NINE

This is the home where you can bring your friends. It will also be a place where the family can have some good times together. It may not be economical and might not be very convenient, but you will always be able to have social good times with the family or friends.

TEN

This is the home that is not expensive. It won't cost much to operate. It will fit in with your family income. It may not be the best place for inviting your friends nor too well planned for health but it will suit the family income.

Now that you know more about these homes, which three would you like best to live in; and which two would you like the least.

Number _____ is my first choice.
Number _____ is my second choice.
Number _____ is my third choice.
The home I like the least is number ___.
The home I like next least is number ___.

What you have done so far has shown what kind of home you think you would like but you can't be sure until you compare every home with every other home. Now you will have a chance to do just that. If you were shopping for a home, which one in each pair would you like best to live in? Draw a circle around the number of the home you prefer in each pair. It might be difficult to decide, but you should make a choice in each case. Don't miss a single one.

1 - is the beautiful home. It has nice colors and good design. It is good to look at both inside and outside.
10 - is the inexpensive home. It won't cost much to operate and will suit the family income.

---

9 - is the home to bring your friends. You will be able to have many good times here.
6 - is for personal interests or hobbies. You can spend your spare time at home doing almost anything you like to do.

---

2 - is the comfortable home. You will be able to rest and relax and feel at ease.
8 - is the safely built home. There will not be much danger of fire, accidents, or other such troubles.

---

7 - is the home that will give you some privacy. You can do the things you want to do without being bothered.
9 - is the home to bring your friends. You will be able to have many good times here.

---

3 - is the convenient home. It is neat and orderly and has many new labor saving devices.
6 - is for personal interests or hobbies. You can spend your spare time at home doing almost anything you like to do.

---

4 - is the home in the ideal location. It is near to the things that are really important to you.
1 - is the beautiful home. It has nice colors and good design. It is good to look at both inside and outside.

---

6 - is for personal interests or hobbies. You can spend your spare time at home doing almost anything you like to do.
10 - is the inexpensive home. It won't cost much to operate and will suit the family income.

---

5 - is the home built for good health. It is clean, there is lots of sunshine and fresh air.
3 - is the convenient home. It is neat and orderly and has many new labor saving devices.

---

10 - is the inexpensive home. It won't cost much to operate and will suit the family income.
9 - is the home to bring your friends. You will be able to have many good times here.

---

8 - is the safely built home. There will not be much danger of fire, accidents, or other such troubles.
7 - is the home that will give you some privacy. You can do the things you want to do without being bothered.

---

9 - is the home to bring your friends. You will be able to have many good times here.
3 - is the convenient home. It is neat and orderly and has many new labor saving devices.

---

3 - is the convenient home. It is neat and orderly and has many new labor saving devices.
7 - is the home that will give you some privacy. You can do the things you want to do without being bothered.

Here you will find the answer to the question on page 199.

Look through the choices you have just made. Count all the 1's you have circled and write the total by number 1 in the list below. Then count the 2's circled and continue through the 10 numbers.

TOTAL	TOTAL
_____1 Beauty	_____6 Personal Interests
_____2 Comfort	_____7 Privacy
_____3 Convenience	_____8 Safety
_____4 Good Location	_____9 Friendship Activities
_____5 Health	____10 Economy

Write the words with the highest totals in the blanks below.

The kind of home that will make me the happiest to live in will provide for:
_____, _____, _____, _____, _____
_____.

Now that you know what kind of a home will make you the happiest, the next step is to see how you feel about the home you are living in.

Describe how you feel about your home by putting a cross (X) on each line. For example, if you feel that your home is very beautiful, put a cross [illegible] if you think it isn't at all beautiful, put a cross there; or if

it is some place between these two, put a cross in between, and do the same with each line.

very beautiful	average	not at all beautiful
very comfortable	average	very uncomfortable
very convenient	average	very inconvenient
very good location	average	poor location
well planned for health	average	poorly planned for health
ample privacy	average	no privacy
very safe	average	very unsafe
good for friendship activities	average	not good for friendship activities
very inexpensive	average	very expensive

The last step is for you to tell what these home values mean to you.

If you were asked to give your idea of a beautiful girl, you might say, "my idea of a beautiful girl is one who has red hair and brown eyes, weighs 120 pounds, and is 5 1/2 feet tall."

In the same way think what a beautiful home means to <u>you</u> and tell <u>three definite things</u> about it. Do the same for all sentences below.

1. My idea of a beautiful home is _____
_____

2. My idea of a comfortable home is _____
_____

3. My idea of a convenient home is _____
_____

4911

4. My idea of a good location is _____
_____

5. My idea of a home planned for good health is _____
_____

6. My idea of a home planned for personal interests is _____
_____

7. My idea of a home that gives privacy is _____
_____

8. My idea of a safe home is _____
_____

9. My idea of a home where I can bring my friends is _____
_____

10. My idea of a home that isn't expensive is _____
_____

If you would like some ideas and suggestions to help you in making your home come nearer to your ideal, circle those numbers above where you want help.

4912

	Agree	Disagree
12. I think a house should have a place set aside for the sick.	____	_____
13. From the standpoint of accidents, I think the house is a dangerous place.	____	_____
14. I must have a location where nearby houses won't lower the resale value of my property.	____	_____
15. I want a house which I can sell at a profit at any time.	____	_____
16. I would only buy a house that had low maintenance costs.	____	_____
17. I want a house for which I can pay as little as possible.	____	_____
18. I often think owning a house leaves too little money for other things.	____	_____
19. I want a house which enables some to save money by doing my own maintenance and repair work.	____	_____
20. I want a house where I can change furniture around.	____	_____
21. In my house I want complete freedom to do as I please.	____	_____
22. I want a place in my house where I can be free from interruption of family members.	____	_____
23. I want a house located where I can be free from neighbors' interruptions.	____	_____
24. I want a place in my house where others can't interrupt me.	____	_____
25. I must have a house which is pleasant for me to look at.	____	_____
26. Having a garden makes living more beautiful.	____	_____
27. A beautifully decorated house adds much to the joy of living.	____	_____
28. I want a house which I can be proud to have my friends see.	____	_____
29. I want a location where my children's playmates will come from families of the right [illegible]al class.	____	_____

	Agree	Disagree
30. I want a house which will help me in my social contacts.	____	_____
31. I want a house just as nice as my friends' houses.	____	_____
32. I think my house has a lot to do with my friends' opinions of me.	____	_____
33. I want my house to give me a feeling of orderliness.	____	_____
34. I must have a house which gives me a feeling of calmness.	____	_____
35. When I'm upset I want a place in the house where I can be alone.	____	_____
36. I get bored having to stay in the house.	____	_____
37. I want a house where I can have plenty of room for my recreation.	____	_____
38. A house is one place where I like to do things for the fun of it.	____	_____
39. I like to spend my leisure time away from the house.	____	_____
40. I want my recreation to come before the household chores.	____	_____

KEY TO HOUSING AND PERSONAL VALUES TEST ITEMS

Family centerism values are measured by scores on items 1-5.

Equality values are measured by scores on items 6-8.

Physical health values are measured by scores on items 9-13.

Economy values are measured by scores on items 14-19.

Freedom values are measured by scores on items 20-24.

Aesthetics values are measured by scores on items 25-27.

Prestige values are measured by scores on items 28-32.

Mental health values are measured by scores on items 33-40.

SECTION TWO: CONSUMER BUYING
UNIT IV: Housing and Home Furnishings
IV-3. Values in Housing[1]

(See Suggested Learning Experience No. 5, p. 90 in Part One)

"Values" in housing can have one of two meanings--the word can refer to the monetary value of a house--or it can refer to the feelings, attitudes, desires, and tastes of the people involved. Values, in the latter sense, "are determined (by the individual's) cultural background, education, habits, and experiences," according to the Cornell Value Study group. The term "values" is used in housing as it is used in the disciplines of soicology and psychology rather than as used in economics, "because, on the basis of recent research, (values) seem to provide a clue to theory that could result in the design of more satisfactory housing for individual families."

Glenn H. Beyer, reporting on a study of approximately 1700 families in the Buffalo and Triple Cities areas of New York, identified nine values in relation to housing that were used in the study. (Reported in Housing and Personal Values, a publication of Cornell University, Agricultural Experiment Station, Ithaca, N.Y.) These nine values are: equality, family centrism, freedom, aesthetics, economy, leisure, mental health, prestige, physical health.

Beyer, Mackesey, and Montgomery referred to a different listing of values in Houses Are for People (Cornell University, Housing Research Center). In this bulletin the human value groups are more briefly listed as:

"ECONOMY: families who place special emphasis on price."

"FAMILY: families who emphasize the health and well-being of the family."

"PERSONAL: families who emphasize personal enjoyment, self-expression, and aesthetics."

"PRESTIGE: families who emphasize social prestige and a formal social life."

In a much smaller sampling of homemakers in Colorado, still a third listing of values was developed, based on "educational felt needs in Housing and home furnishings" (Colorado State University and Colorado State Board for Vocational Education). Felt needs were expressed in six value categories: safety, beauty, privacy, economy, efficiency, independence.

Still other lists can be used, other values added, or some combined. The exact listing seems to be of relatively little significance in high school teaching of home economics. But what is important is that students are

---

[1]Reprinted from Tips and Topics in Home Economics. Lubbock, Texas: College of Home Economics, Texas Tech University. Vol. VII, No. 2, December, 1966. pp. 4-5.

4916

guided in the development of concepts and generalizations that can guide their housing decisions in relation to values and other factors.

Concept: Human factors influencing the form and use of housing
Generalizations: Housing standards are influenced by incomes, values, attitudes, educational levels, and housing knowledge.
Man consciously or unconsciously expresses his values through housing.
The values of individuals and families, their standards, their ways of living, and their preferences affect the neighborhood environment.

It seems imperative that students be helped to identify their own values, clarify which values are more important to themselves than are others, and how these values influence their family housing and the housing of others. In understanding one's self and one's choices, one can better understand other people and their choices.

Let us look at the nine values identified by Beyer and see what they mean in relation to a family's housing. The description of the value is the explanation given by Beyer (Housing and Personal Values). Most people are oriented toward several of these values, but the nine values he identified fall into two groups:

(1) "Those individuals who are oriented toward family centrism, equality, economy, and physical health are adjusted to the reality of living as a group and are generally less sensitive to the material world."
(2) "Those who are oriented toward freedom, mental health, aesthetics, prestige, and leisure are more individualistic and generally express a high degree of sensitivity to the material world."

Equality

"This value involves rank, rights or privileges. A person having this value is expected to respect the rights of others and to be sensitive to their needs. He will treat others as equal or near equal, and his family relationships will be based on mutual respect. In the family, this includes relationships of husband-wife, parent-child, and children-children, and equality in the treatment of the in-laws." (Beyer) The individual might say:

I want a house where children's needs can be considered before others.

Teachers and students might:

--Examine pictures of, or make visits to homes of varying economic and social levels. Determine whether there is evidence that equality is the value of the family.

--Analyze floor plans to find ways of meeting individual family needs and interests.
--Plan ways that family members can entertain their own friends at home and have a desirable amount of privacy.
--Read short stories to find ways that individual rights are respected in houses of different sizes.

Family Centrism

"Individuals having an orientation toward this value are expected to regard the family as a relatively self-sufficient and tightly knit unit. They will often judge situations to be good or bad, desirable or undesirable in relation to the effect on the family as a whole." (Beyer) The individual might say:

> I want a house with enough room for our parents to feel free to move in...I want a house where family members can spend time together.

Teachers and students might:
--Investigate ways that houses can be arranged so that families have opportunity to share activities, yet have opportunity for privacy.
--Visit homes that are well planned to provide for three or four generations to live in the same house.
--Discuss advantages of selecting multi-purpose furniture, and furnishing multi-purpose rooms.
--Identify ways a house may be changed to meet the needs of different age groups, and different families as they move from one family life stage to another.

Freedom

"It is expected that a person who values freedom places emphasis on being allowed to make as many of his own decisions as possible. He tends to rebel at assignment, regimentation, and other forms of restrictions. He usually wants to pursue interests and activities of his <u>own</u> choosing. Thus, to a considerable extent, he is an individualist and a non-conformist, refuting the authority of custom." (Beyer) The individual might say:

> I want a house where I can change furniture around...In my house I want complete freedom to do as I please.

Teachers and students might:
--Determine the characteristics and the features houses may have if a family values freedom to a great extent.
--Describe features in the homes of their friends that indicate that freedom is a primary value of the family.
--Discuss: If only one family member has this value, how might arrangements in the house be consistent with his value and yet not encroach on other family members' wishes?

4918

Aesthetics

"A person holding this value is expected to evaluate his environment in terms of its orderliness, harmony, and beauty. He values what he himself sees or experiences, as opposed to what social opinion says he should experience. He usually wants to express his own individuality and his own tastes, and this tends to permit him to be singled out from others as an individual in his own right." (Beyer) The individual might say:

> I must have a house which is pleasant for me to look at...Having a garden makes living more beautiful.

Teachers and students might:
--Take a field trip to see actual houses and analyze the houses and individual rooms for total effect of aesthetic groupings.
--Experiment with furnishings in the living room of the home economics department for most pleasing effects.
--Experiment with changing the entire appearance of a room, merely by use of accessories.
--Collect a group of fabrics (different colors and textures) and discuss what effects they give and where they might be used.
--Arrange with real estate agents to visit vacant apartment buildings and houses. Plan ways that a family who places great value on beauty could change the apartment or house to satisfy this value.

Economy

"Economy is recognized as a value by persons who tend to emphasize the economical uses of goods and services. The worth of one item is usually measured against the worth of another before making a choice, frequently in monetary terms but sometimes in terms of efficiency. Economic pressures are quickly sensed by individuals who hold this value." (Beyer) The individual might say:

> I must have a location where nearby houses won't lower the resale value of my property.

Teachers and students might:
--Collect documents used when purchasing a house: investigation of title, recording of deed, contract, mortgage. Investigate comparative costs of different services concerned with house purchasing.
--Investigate rental costs, with services provided in each case.
--Talk with representatives of utility companies about ways to reduce utility bills.
--Compute and compare interest costs of different loan companies and banks for buying furniture and major appliances "on time."
--Compare costs of living in a mobile house, an apartment, and a house.

Leisure

"A person holding this value tends to place personal enjoyment before work and its reward. Such a person wants more than the average amount of time for recreational activities. Leisure to him is an end in itself...(he) may either pursue recreational activities or simply be passive toward work." (Beyer) The individual might say:

> I want a house where I can have plenty of room for my recreation... A house is one place where I like to do things just for the fun of it.

Teachers and students might:
--Look at pictures of houses (interior and exterior) and suggest inexpensive physical changes that could be made to satisfy a family's value of leisure.
--Plan ways that housework and other work in the home can be simplified to make for more leisure which the family values.
--Role play a situation in which the value of leisure is not met satisfactorily; determine possible effects on family members in other areas of their daily lives.

Mental Health

"The person who values mental health wants peace of mind primarily and will try to achieve this by attempting to control his enviornment, or, if he can not do that, adjusting to it in a way that will tend to reduce frustration, anxiety, and other inner conflicts." (Beyer) The individual might say:

> I want my house to give me a feeling of orderliness...I must have a house which gives me a feeling of calmness. When I'm upset I want a place in the house where I can be alone.

Teachers and students might:
--Search through current "women's magazines" for feature articles describing the home life of well known persons, with pictures of those persons' homes. Is there any evidence that the individual person and his family value mental health? Cite evidences.
--Explore the market for ways to reduce sound levels in houses (such as the use of window fabrics and carpets, special "soundproof" ceiling materials). Try to find the causes of increased sound levels within the house and from outside the house. Show house plans with sleeping areas in the rear away from street sounds.
--Find examples of mobile devices for attaining privacy inside the house, and the use of fencing and landscaping to provide privacy.
--Cite examples of houses that provide for rest by family members (a quiet place for mother to take a nap in the middle of the day).

Prestige

"Individuals holding social prestige as a value generally have a great desire for the attention and respect of their peers. It is important to

them to be represented as the right kind of person. In some instances, they seek distinction in sophisticated and subtle ways and in other instances through extravagant display." (Beyer) The individual might say:

I want a house which I can be proud to have my friends see.

Teachers and students might:
--Distinguish between families who have a high value of beauty, yet because of their income and special family needs, persons of lower income might mistakenly interpret the families' values to be primarily social prestige.
--Show how families of all economic levels may have prestige as a value. Explore ways that this value is expressed.
--Cite examples of houses in the community which reflect prestige as a value; interpret the relationship of this value to other values held to be important.
--Locate examples of houses (pictured in magazines) that show prestige as an apparent value expressed in sophisticated ways; in subtle ways; and through extravagant display.

Physical Health

"A person with this value tends to make his decisions according to what he thinks their effect will be on his physical well-being. He is likely to want to promote, or at least not to impair his physical health. He will be concerned with sunshine, fresh air, diet, physical exercise, and so on, and is likely to avoid situations that might lead to physical fatigue, ill health or accidents." (Beyer) The individual might say:

I want every room in my house to have a good supply of fresh air.

Teachers and students might:
--Inventory their own homes for safety hazards.
--Demonstrate scientific principles involved in accident prevention.
--Read about ways that ventilation affects comfort, efficiency, and relationships. How can construction techniques, placement of house on the building lot and location of trees affect temperature control?
--Explore work habits that will minimize fatigue.
--Observe arrangement of rooms to meet physical needs.
--Read research on the effect that temperature has on employees' productivity, and apply this knowledge to home activities.

SECTION TWO: CONSUMER BUYING
UNIT IV: Housing and Home Furnishings
IV-4. Crossword Puzzle--Housing

(See Suggested Learning Experience No. 27, p. 94 in Part One)

4922

CROSSWORD PUZZLE--HOUSING

4993

219

CROSSWORD PUZZLE--HOUSING[1]

ACROSS

1. A multi-family, rental housing unit
4. A type of moveable home
6. The amount owed on property for tax purposes
7. A value in housing important to individuals who seek independence
11. The part of a property that usually requires time-consuming care from the homeowner
14. The amount your property is worth minus what you owe on it
15. A sum of money borrowed with the agreement to repay according to the terms set by the lender
16. A real estate broker
18. The fee one pays for the use of someone else's money
20. A value in housing which makes individuals desire an aesthetically pleasing environment
21. One who has bought property
25. A legal document attesting to an individual's ownership of property
26. Property of monetary value put up to secure a loan
28. An institution which some families wish to find near the neighborhood where they establish homes
30. Objectives toward which individuals work
31. Funds assessed by local, state and national governments to provide services for the general public
32. One basic physical need of families and individuals
33. A basis of comparison which sets acceptable limits for a desired goal
35. One factor which influences housing choices
36. A value in housing which makes individuals seek facilities for sharing as well as opportunities for privacy when they make housing choices
37. A housing value held by individuals who have a great desire for the attention and respect of others
38. A professional person legally empowered to act for a client

DOWN

2. To estimate the value of property
3. A written agreement put in the care of a third party which does not become effective until certain conditions are fulfilled
5. A housing value important to families who place special emphasis on price
6. The legal description of a property plus its history of ownership
8. A housing value held by individuals who respect the rights of others
9. One of the factors influencing housing choices which is affected by the size of the family, the activities family members engage in and the possessions they have to store
10. Paying for the use of someone else's property
12. A legal agreement which pledges property as security for the payment of a loan and stipulates the procedure which will follow if the borrower fails to repay the loan

---

13. A source for mortgage loans involving a small risk for the lending institution (initials--3 letters)
14. A deposit of money made on property you wish to purchase to signify your intent to go through with the deal
17. A housing value which prompts individuals to seek adequate room and facilities for recreation
19. A term applied to the type of savings which equity represents
22. Reducing the principal of a loan by making regular payments on it
23. The important ideals and beliefs of individuals which influence the choices and decisions they make
24. A factor influencing housing choices dependent upon services desired
26. A multi-family housing unit in which apartments can be purchased and maintained by individual owners who also hold a proportionate interest in the common areas of the property
27. A legal document describing the obligations agreed to by a tenant and a landlord
29. A type of mortgage agreement that allows for the borrowing of additional sums under the terms of the original mortgage agreement
34. A type of multi-family dwelling in which apartments may not be purchased outright and in which profits, expenses and risks are shared by the individuals and families who select this type of housing (abbreviation)

SECTION ONE: CONSUMER BUYING
UNIT IV: Housing and Home Furnishings
IV-5. Housing Decisions[1]

(See Suggested Learning Experience No. 28, p. 94 in Part One)

David Jackson, a junior accounting major in a state university, is engaged to Jane Bond, a junior primary education major. They plan to be married in June. David earns $200 a month at a part-time job in the business manager's office at the university. He receives $75 a month from an educational insurance policy his family took out on him when he was a child. Jane earns $25 per week working three hours a day and Saturday afternoons in a children's clothing shop. They will attend at least one session of summer school and keep their jobs. Jane's avocational interests are music and art. David's are hunting and gardening. They have a 1966 Ford Mustang, a portable TV, a stereo and a piano.

After graduation David plans to work in Dallas in a large accounting firm that handles the business affairs of a varied clientele including individuals, business firms and estates. David's beginning salary will be $600 a month, and he can expect to be earning $750 to $800 by the end of five years. He plans tc work with this firm for about five years, then he would like to move from the city to a large town and establish his own accounting firm that would eventually include two or three partners. If he does well in private practice, he may eventually earn $15,000 to $18,000 per year. In the beginning, he may expect to earn about $10,000 a year.

Jane will teach for four or five years, then they plan to have a family. She and David want two children. They prefer bringing their children up in a large town instead of the city. They plan to live a rather conservative life--participating in civic, school and church affairs--and doing many things together as a family.

I. A. What is/are David's and Jane's central goal/goals?

B. What are their satellite goals?

C. What resources do they have that will help them reach their goals?

D. Give three examples that indicate they have made some definite plans toward reaching those goals.

II. They will have to make several decisions regarding housing at various stages in their family life cycle. From the choices or situations given below, tell what decision would be appropriate for the stage specified and give reasons for your opinion.

---

[1]Developed by Mrs. Mary Lois Scott, Home Economics Teacher-Coordinator, Wellington, Texas.

A. Beginning--establishment phase (immediately after marriage through graduation)
   1. One-bedroom furnished apartment with central heating and air-conditioning. Bills paid; $125 a month.
   2. Two bedroom apartment with range, refrigerator, living room furnished, central heating. $80 per month, no bills paid.
   3. A two bedroom mobile home, two years old, in excellent condition, payments $90 per month, will be paid off in seven years.

B. On the basis of your study of the classified ads, what kind of housing do you suggest they secure in Dallas? Consider (1) What can they afford to spend for housing? (2) Should they rent, buy, or build? Give reasons for your answer. (Be sure to discuss factors that would influence their decision.)

C. Expectant and Childbearing phases
   At this stage of the family cycle David and Jane want to build or buy a home of their own. They have found a very beautiful four-bedroom brick home for $30,000. It is eight years old, in need of some redecorating, and in a neighborhood they like. The grounds are neat and well kept. They can borrow money at 5 3/4% for 30 years. Could they afford this house? Under what circumstances would it not be too great a financial burden to them? What factors should they consider as they try to decide whether it would be better to buy this house or build a new house for the same amount of money? (Show your work. Give reasons to justify your opinions.)

D. Trace the housing needs of this couple through the remaining stages of the family life cycle. What housing decisions lie ahead for them at each stage? Use the steps in decision-making to guide your thinking. Consider their goals, both present and long-term, their resources, the alternatives they have to consider, the possible outcomes of each alternative you suggest and then the decision you would recommend. Justify your reasoning.

SECTION TWO: CONSUMER BUYING

UNIT V: Buying and Maintaining Automotive Products and Services

V-1: Forumla for Cost of Buying a Car

(See Suggested Learning Experience No. 21, p. 101 in Part One)

$$\frac{\text{Total fixed and variable cost}}{\text{annual mileage}} = \text{cost per mile}$$

Problem:

Bill bought a used car for $1400. The total of the three year note at the bank for the car loan was $2000. He budgeted approximately $40 a month for operation expenses. Based on past experiences, he estimated he would drive 50 miles a week. What will be the cost per mile for one year?

4928

SECTION TWO: CONSUMER BUYING
UNIT V: Buying and Maintaining Automotive Parts and Services
V-2. But Couldn't We Buy This Car?

(See Suggested Learning Experience No. 3, p. 99 in Part One)

The Williams family is considering the purchase of a second car. Mrs. Williams is a private secretary and rides to work with her husband. Her hours are not exactly the same as his, therefore, she could often use her time to a better advantage if she could have her own car.

Keith Williams is 18 years old. He will be allowed to drive the new car to junior college 30 miles away where he will be taking courses three days a week this summer. Although he owns a car (a ten year old model!), he will use the new car for dating.

Mr. Williams, manager of a department store, will use the car occasionally on week-ends for recreational excursions. Each family member has strong preferences regarding the kind of car he thinks should be bought.

DIRECTIONS: Role play this situation. As you do try to answer some of the following questions considering different family members' viewpoints.

What factors should the Williams consider in deciding on a car?
What size car would fit their needs. What options might they consider?
What price range might be suitable? Should they buy the car now or wait? Should they use cash or credit? Will they buy a new or used car?

SECTION TWO: CONSUMER BUYING
UNIT VI: Food
VI-1. Biscuits: To Buy or Make?[1]

(See Suggested Learning Experience No. 20, p. 106 in Part One)

(Sample--could adapt to any product)

I. Score the three types of biscuits you are comparing according to the Betty Crocker score sheet you were given. Call the canned biscuits A, the mix biscuits B, and the biscuits from "scratch" C.

II. Compare preparation time for biscuits

	A	B	C
Time began	_____	_____	_____
Time finished	_____	_____	_____
Elapsed time	_____	_____	_____

III. Compare number of pieces of equipment used in preparation of

A	B	C
_____	_____	_____

IV. Find the cost of each type of biscuit, using one cup flour for basic biscuits and one cup biscuit mix to compare with one can biscuits.

A	B	C
_____	_____	_____

Cost of ingredients:

1 c. flour = 3 1/2¢
1 c. shortening = 13¢
1 c. milk = 7¢
1 c. mix = 8¢

Cost of baking powder and salt is negligible. You might add 1/2¢ to total cost.

CONCLUSIONS:

Best quality biscuit _____
Lease expensive biscuit _____
Circumstances under which each would be a desirable choice (Use your own paper) _____

SECTION TWO: CONSUMER BUYING
UNIT VI: Food
VI-2. The Cost of Home Cooking[1]
by Mary Lumsden

(See Suggested Learning Experience No. 21, p. 106 in Part One)

Carol and Larry were recently married. Larry works at a local service station and Carol works at a nearby factory.

By the time Carol gets home from work every night she is exhausted. As she enters the house she is usually greeted by the familiar words of her husband, "What's for supper tonight, honey?"

Carol begins at once to prepare her meal by getting out the convenience foods and taking the packaged mixes from the cupboard shelf.

Let's listen to their discussion tonight:

"Carol, I wish you could cook like my mother. She never used any of those mixes. I'll even bet you could save lots of money if you made things yourself instead of using those convenience foods, and you know we need to save all the money that we can."

"So you think that convenience foods are more expensive? While I'm preparing supper why don't you read this pamphlet that I just ordered? See if what it has to say about convenience foods changes your mind."

Larry sits down with the pamphlet and begins to read. "This is interesting. I really hadn't thought of it in this way. I guess we do have to count the cost of your time.

"It says right here that preparation time is less for these convenience foods than those prepared at home. In home prepared foods one must consider the amount of time used in reading directions, peeling, cutting, stirring, measuring, pouring, putting on and removing from the range, and serving and cleaning up.

"Sometimes the food cost of convenience foods is actually less than the cost of the ingredients for home-prepared products because of the efficiency possible in mass production. It says that the average 'convenience food' meal, for four, costs $2.23 and is prepared in 32 min. while the average home-prepared meal costs $2.00 but takes on the average 1 hour and 59 min. to prepare. When you value the time of the homemaker at $1.40 per hour, you are actually saving 38% of the total cost in using prepared foods."

---

[1]Reprinted from Illinois Teacher for Contemporary Roles. Urbana, Illinois: Division of Home Economics Education, University of Illinois. Vol. XIII, No. 2. November-December, 1969. pp. 84-85.

"And just think, Larry," says Carol, "if I had to prepare a complete meal after I came home from work, we wouldn't be eating until nine or ten o'clock. How would your stomach like that? If it took me that long to prepare supper I wouldn't have time to do the cleaning, ironing and all of the other things that I have to do tonight. Of course, if you would like, I could send the ironing out and have a cleaning lady come in every day so that I could spend more time preparing your meals."

"No, Carol," says Larry, "I think you're the wise one. I wonder why my mother doesn't use convenience foods."

"I don't know. There's something else you will have to remember, too," says Carol. "I haven't had as much experience in preparing food as your mother. I'm probably saving us lots of indigestion pains by using convenience foods."

They both laugh as they sit down to eat their "convenience meal."

This story could be followed by another one about a couple who loved to cook as a hobby, saved money on food, had dishes they could not have bought and into which they put extra nutritive values, etc.

After students had read both, a discussion could reveal which appealed more and why. Differing viewpoints could be supported and respected. The role of values in decision-making could be pointed out.

VI-3. Cartoon on Food Additives

(See Suggested Learning Experience No. 23, p. 106 in Part One)

"Doris, know what? — This product is composed of nothing EXCEPT additives."

OBJECTIVES: To become aware of the widespread use of food additives.

What are food additives? Why are they used?

Examine packaged food products in the foods lab and make a list of all the food additives they contain. Did you find any product to be free of additives?

Who determines which and how much additive(s) a product can contain?

Do you recall any recent controversy regarding the use of food additives? How was it resolved?

THE BETTER HALF[1] **By Bob Barnes**

"Oh, I'm so glad you like my new hat, dear!"

OBJECTIVE: To recognize individual differences in clothing values

Did you ever buy an article of clothing with which you were greatly pleased, only to find that your family members thought it was a ridiculous or most unsuitable purchase? If so, what was it?

What prompted you to buy it?

Did the family's displeasure spoil the pleasure you expected to find in owning and wearing the article?

Can you recall ridiculous clothing purchases that your family members have made in the past?

How do you account for these conflicting views regarding what is suitable and what is ridiculous?

---

[1]The Better Half by Bob Barnes reproduced by permission of the Register and Tribune Syndicate, Des Moines, Iowa.

FROM NINE TO FIVE [1] **By Jo Fischer**

"Will you please drive slower? I hardly have time to see what's in the store windows!"

OBJECTIVE: To recognize how individual values are reflected in the things that attract one's attention

Study the four people in this picture and tell how you think the three people are reacting to the speaker.

What has probably been the reaction of the two silent passengers and the bus driver as they drove past all the window displays? What has been holding their attention?

If each of these people went into a store to purchase an item of clothing, what values would be most influential in determining his clothing choice? Why do you think so?

With which of the people do you identify most closely? Why?

VII-3. Jane Decides[1]
by Maurietta Cusey

(See Suggested Learning Experience No. 14, p. 110 in Part One)

Jane came bursting into the kitchen, executing a jubilant dance around her mother.

"Mother, guess who just called?" Not waiting for an answer the words tumbled forth. "Dan Myers, the dreamiest boy in school and he wants me to go to the Homecoming Dance. He's the answer to every girl's prayer, and he's asked me! Mother, I'll have to have a new dress. I just can't go in that old blue velvet with DAN MYERS! There's the dreamiest dress at the Fashion Nook. It's just the dress to give me a new personality. Mother, may I? Can we possibly--I know we decided the blue velvet would do if I were asked to the Dance. But I didn't dare hope Dan would ask me."

"That's wonderful that such a popular boy asked you to the dance; but surely it doesn't make that much difference in your choice of dress. The blue one is really becoming to you. It's your best color and the style is good, too."

"But Mother, it just isn't Dan's type. Besides all the other girls are planning on new dresses for this special occasion. It only comes once a year. Perhaps I could give up my allowance for several months and maybe a few more baby sitting jobs--"

"Jane, I do realize how important this is to you; but perhaps we can talk it over a bit more. Do you remember our family planning session last week? When we planned our expenditures for this month, there was little left for extras. The new tires for the car, David's dentist bill and your new winter coat are immediate expenses that are imperative. If you gave up your allowance, how would you cover your current expenses--school supplies, lunches, etc.?"

"Maybe I could make my old coat do for another season."

"That will be your decision to make, Jane, if you feel this one time warrants such a sacrifice."

Jane went to her room to think for awhile. She was not very happy to give up either the coat or the dress. After awhile she came back to the kitchen.

"You've made your point, Mother. I would look pretty silly in that old winter coat and an expensive new dress; but thanks for giving me the opportunity of making the decision. I guess it wouldn't be worth being in debt the rest of the year just so I could look glamorous one night. The

---

4938

blue velvet it will be, and Dan can take me as I am. Maybe you would help me do a little something to it?"

"Of course. Perhaps a glittery trim at the neck and hemline for a bit more glamour. Time expended in handwork can take the place of money."

"Thanks for the idea. Really, Mother, the blue velvet is more my type, and Dan did ask me the way I am!"

1. How would you rate the communication or understanding between this mother and daughter? Can you think of other ways this mother might have responded? How might this have affected Jane's response?

2. Why were the items listed for purchase more important than the new dress?

3. Pretend Jane had decided to go ahead in purchasing the dress in preference to the needed coat. It is now a month later and the weather is cold. Dan has asked her for another date; this time to go to a play. Can you imagine the possible conversation that might take place between Mother and Jane? (This would be a good situation for role playing.)

4. This story implies the family meets together to go over finances, making plans that involve all. How do you feel about such a family planning session? How could this solve financial problems in a family?

Written assignment:

Make a list of the items you want in the next week. How much money is involved in this? How many of these items will you actually secure? How will you decide which to buy? What do the other members of your family want to buy?

Make a list of items you would like to have in the next three or four months.

Will your immediate day-to-day purchases affect your ability to acquire these items?

SECTION TWO: CONSUMER BUYING
UNIT VII: Clothing
VII-4. Alice Selects a Coat[1]

(See Suggested Learning Experience No. 19, p. 111 in Part One)

Use your own paper in responding to the following items:

I. Alice is shopping for a new coat. She has a dress coat two years old and a corduroy school coat one year old. She is going to college next fall and is trying to select a coat that will fit into her college wardrobe. Coat I is the most flattering to her coloring. Coat II is more versatile. Coat III is an all-weather coat. If she chooses coat one, what values will be most strongly influencing her?

What values (or advantages) will she be giving up if she does not choose coat two?

What values will she be giving up by not choosing coat three?

What disadvantages do you see in her choosing coat one? coat two? coat three?

What coat do you think she should choose and why?

Would this be the same coat you would choose to meet the needs of your own wardrobe? Why? If not, which one would you choose and why?

Interview one of your classmates to determine which of the coats she would choose and why.

How do you account for this difference in choices?

II. Advertising has two purposes: one, to furnish pertinent information to the consumer and the other, to make a psychological appeal that will sell the product. Evaluate the advertisements on display. (Use your own paper.) Put the items of information from each ad under the proper heading.

Important Consumer Information	Psychological Appeal
1.	
2.	
3.	
4.	

[1]Developed by Mrs. Mary Lois Scott, Home Economics Teacher-Coordinator, Wellington, Texas.

Which advertisement do you think gives most adequate consumer information? What other information is needed in each of the three other ads to enable one to make an intelligent decision about buying?

[NOTE TO TEACHER: Display pictures of two currently fashionable coats that a high school senior might choose. Coat I should be glamorous and, perhaps, impractical. Coat II should be a very attractive coat but more versatile than coat I. Coat III is an all-weather coat.]

I-4. Consumer Information[1]

(See Suggested Learning Experience No. 20, p. 119 in Part One)

Here's how one consumer's day might go if he got all the latest news:

Before breakfast, he learns from the FTC that the razor blades he uses, are "not materially superior to stainless steel blades" during the first five shaves despite what the ads say, and whatever corrosion occurred on Brand X blades "had no material effect" on shaving performance.

At breakfast, he hears the same agency question the claims that the Low Calorie Breakfast he is having "is of as much or more nutritional benefit as a breakfast comprised of two fresh eggs, two slices of bacon, two slices of buttered toast and an orange or glass of orange juice." (Incidentally, according to an earlier study at Cornell University, this advertised breakfast might also cost more.)

When he switches to a new brand of instant non-fat dry milk, he learns it has recently been recalled because of salmonella in samples tested by the FDA.

On his way to work in his 1969 coupe, he hears that the National Highway Safety Bureau claims that this model and the 1968 sedan have stearing columns that do not meet Federal safety standards despite the company's certification.

And he learns that his favorite tire company has agreed to recall approximately 43,000 tires because samples failed to pass endurance and strength tests required by the government.

He later is told by the FTC that the claims made for the new "autostabilizer" on his wife's car misrepresented that it is an effective safety device, that it is an anti-skid device that will increase traction, and that it will automatically pull the rear end of a skidding car into line or will help save lives.

Back home, he gets set to apply their usual week-killer on the yard, only to be told by his wife, who heard it from the U.S. Dept. of Agriculture, that the chemical has been banned for such use because it had caused birth defects in mice. (It was not banned, however, on ranges and pastureland.)

SECTION THREE: CONSUMER CITIZENSHIP
UNIT II: Government Legislation
II-2. Federal Legislation

(See Suggested Learning Experience No. 1, p. 123 in Part One)

Prior to 1950

Sherman Antitrust Act of 1890--encouraged free market and fair competition by prohibiting all contracts, combinations, and conspiracies that monopolize or restrain interstate or foreign trade; and prohibited businessmen from agreeing among themselves not to compete. An individual or corporation acting alone cannot violate this law.

Meat Inspection Act (1906)--provided beginning of federal supervision and regulation in meat industry where products were involved in interstate commerce.

Clayton Act (1914)--supplemented Sherman Antitrust Act of 1890 and closed loopholes in it. It is aimed at activities of individual businessmen rather than at groups of businessmen acting together. It condemns any action that enables an individual seller to monopolize a market.

Federal Trade Commission Act (1914)--created the Federal Trade Commission which enforces laws prohibiting unfair trade practices.

Robinson-Patman Act (1936)--prevented restraint of trade. One purpose is to prevent the seller from giving unusual discounts to one customer and requiring someone else to pay the standard price.

Miller-Tydings Act (1937)--made state fair-trade laws valid.

Wheeler-Lea Act (1938)--an amendment to the Federal Trade Commission Act. Provisions of the amendment are:

1. In general, all unfair methods of competition in commerce as well as unfair or deceptive acts or practices, are declared unlawful.
2. It is unlawful to publish or distribute false advertising in order to induce purchases of foods, drugs, devices, or cosmetics.
3. Publishers, radio broadcasters, advertising agencies, and other advertising media are relieved from liability for advertising statements, unless they refuse to furnish the Commission with the name and address of the manufacturer, packer, distributor, seller, or advertising agency that causes the distribution of the advertisements.
4. False advertising is defined as advertising that is "misleading in a material respect," including the failure to reveal facts as to consequence that may result from the use of the advertised commodities.

Federal Food and Drug Act (1938)--insured that foods are safe, pure, and wholesome; and made under sanitary conditions; that drugs and therapeutic devices are safe and effective for their intended uses; that cosmetics are safe and prepared from appropriate ingredients; that all of these products are honestly and informatively labeled and packaged. It makes it illegal to [illegible] or sell in interstate commerce goods that do not meet acceptable standards.

Securities and Exchange Act (1934)--provides Federal Reserve Board with power to limit amount of credit one can obtain for purpose of purchasing stocks on registered security exchanges.

Wool Products Labeling Act (1939)--classified wool product as any product made wholly or in part of new, unused wool, reprocessed wool, or reused wool. Label must indicate class of wool used, percentage of fibers that are actual wool, and whether it is loaded or weighted in any way. The name of the manufacturer, distributor, or retailer must be on the label.

1950-1959

Fur Products Labeling Act (1951)--required that each product made of fur must be identified with a stamp, tag, or label giving specific information as to kind, name, and grade of fur.

Flammable Fabrics Act (1953)--prohibits manufacture and/or sale of any article of wearing apparel that does not meet Commercial Standard for Flammability of Clothing Textiles prepared by Commercial Standards Division of Department of Commerce. It is enforced by the Federal Trade Commission.

Automobile Disclosure Act of 1959--prevented misrepresentation by dealers of the value of the cars they sell and the trade-in allowances they give.

1960-1970

Color Additive Amendment (1960)--required retesting of all colors previously listed for certification.

Federal Hazardous Substances Labeling Act (1960)--required warning labels and other consumer-protection information to appear on any household product such as foods, drugs, and cosmetics that is toxic, corrosive, or flammable or that is an irritant or a strong sensitizer, or that generates dangerous pressure through decomposition, heat, or other means.

Textile Fiber Products Identification Act (1960)--protected consumers by requiring that textile fiber products bear labels identifying each fiber by the name for it that was approved by the Federal Trade Commission. The percentage of the fiber, by weight, in the piece of textile fabric must be given.

Kefauver-Harris Drug Amendments to Food, Drug, and Cosmetic Act (1962)--broadened scope of Food and Drug Administration's work and provided additional protection for consumers. It required drug makers to show by substantial evidence that any new drug is effective as well as safe.

National Traffic and Motor Vehicle Safety Act and Highway Safety Act (1966)--insured that all new cars manufactured after January 1, 1968, would conform

to Federal motor vehicle safety regulations and sets national standards of tests and regulations for drivers.

Fair Packaging and Labeling Act (1967)--enabled Food and Drug Administration to regulate packaging and labeling to prevent deception. It required clear indication of weight or volume; amount in each serving; standards for descriptions; and ingredients in amounts of proportions.

Wholesome Meat Act (1967)--extended the provisions of the 1906 Act so that all meat, not just that covered in interstate commerce, would be inspected by either the Federal government or an adequate state program.

Freedom of Information Act (1967)--opened all federal information not violating national security or trade secrets to the public.

Wholesome Poultry Products Act (1968)--updated the 1957 Poultry Products Inspection Act and provided for the inspection of all poultry and poultry products under a national uniform standard for wholesomeness.

Radiation for Health and Safety Act (1968)--dealt with radiation output of color television and electronic ovens. The act set standards for television. Department of Health, Education, and Welfare is to carry out research to determine what the biological effects of radiation are, at what levels they are dangerous, and to set regulatory standards.

Toy Safety Act of 1969--amended the Federal Hazardous Substances Act to protect children from toys which are hazardous due to the presence of electrical, mechanical, or thermal hazards, and for other purposes.

Public Health Smoking Cigarette Act of 1969--extended public health protection with respect to cigarette smoking.

Environmental Quality Control Act (1969)--established Environmental Quality Council. It is presided over by President of United States or the Vice President in his absence and is composed of the Vice President, and Secrtaries of the following departments: Agriculture; Commerce; Health, Education, and Welfare; Housing and Urban Development; Interior; Transportation; others as need is seen.

Functions:

1. Advise President on environmental quality matters
2. Recommend measures to ensure that programs dealing with development and conservation of natural resources take into account environmental effects
3. Review adequacy of systems for monitaring and predicting environmental changes
4. Foster cooperation between federal, state, and local governments and private organizations in environmental programs
5. Seek advancement of scientific knowledge to prevent the endangering of man's health and well-being
6. Stimulate public and private programs and activities to protect against pollution

Clean Air Act (1969)--made provision for fuel and vehicle research to eliminate air pollution.

Truth-in-Lending, Regulation Z (1969)--required that the cost of credit be made available in writing to the borrower and/or customer so he will know how much he is paying for credit and its relative cost in percentage terms.

Federal Trade Commission Trade Practice Rule (1970)--baned the unsolicited mailing of credit cards and suggests that unsolicited ones be mailed to the Federal Trade Commission, Washington, D.C. 20580, with a letter explaining how the cards were received and that they were not asked for or accepted.

SECTION THREE: CONSUMER CITIZENSHIP
UNIT II: Government Legislation
II-3. Yardstick for Comparison

(See Suggested Learning Experience No. 7, p. 124 in Part One)

Truth-in-Lending Law requires:

Revolving accounts to include the following information:

- Balance outstanding at beginning of the billing period
- Amount and date of each credit extension during the billing periods--and a brief description of any purchase
- Amount credited to the account during the billing period--for payments, returns, exchanges
- Dollar amount of finance charge
- Periodic rate used to figure charges
- Annual percentage rate charge
- Balance on which charges are computed
- Closing date
- Date for paying without incurring additional credit charges

Time Payment or installment contracts to state:

- Name and address of buyer and seller
- Description of the purchase
- Cash price
- Down payment or trade-in allowance, if any
- Unpaid balance
- Itemized list of charges not included in finance charge
- Total amount financed
- Finance charge in dollar amount
- Annual percentage rate
- Date on which charges begin to accrue
- Number, amount, and due dates of payments
- Total payments
- Amount and explanation of penalities for late payment
- Description of security interest held by the creditor, if any

FIGURED FOR FRAUD

Door-to-door Salesmen
What's his lead? What promises does he make? What's the price? the quality? Check his address. READ BEFORE YOU SIGN!

Mail Fraud
Who's it from? What must I do? How much will it cost? How good is it?

Unordered Merchandise
Did someone in your family order it? You don't have to pay for it or return it, if you don't use it.

Subscriptions
What's the catch? How much will it cost in all? REMEMBER--FEW THINGS ARE REALLY FREE!

Bait and Switch
Is merchandise really for sale? Does salesman try to show you something higher priced or critize the sale item?

Sale
Is it really a sale? How do prices compare with those in other stores? What about quality?

4960

DESTINED TO DECEPTION

Referral Plans
Are you promised a discount if friends whose names you give buy?

Wholesale Prices
If the seller is a retailer, he can't sell wholesale.

Free
Remember--few things are really "free."

Contests
Who were the winners? Do you have to buy something in order to get your prize?

Home Improvement Racket
Are you promised free stamps, payment for using your home for advertising purposes? Does the repairman use the scare approach? READ BEFORE YOU SIGN!

BEWARE OF THESE

CUES TO QUACKERY

Does he use a special machine or "secret remedy"?

Does he claim that the medical profession is against him?

Does he say surgery and X-rays and drugs are bad?

How did you hear about the remedy or the doctor? REAL DOCTORS DO NOT ADVERTISE!

Does he use testimonials from "cured" patients?

Can you buy the remedy through the mail?

III-4. The High-Pressure Salesman[1]

(See Suggested Learning Experience No. 2, p. 127 in Part One)

Sally Jones: A typical high school graduate

Mr. Joe Blowhard: A high-pressure salesman

Mr. Blowhard: Hello, sucker, or-er, I mean Miss Jones, Congratulations. I heard you're graduating from high school soon. I'm Joe Blowhard of the Fly-by-Night Pot and Pan Company. I'm sure you've heard of our reputable, honorable company, haven't you? Oh, of course you have.

Sally: Well...er...yes...(Joe interrupts)

Mr. Blowhard: Wonderful! Our company has a special bargain for graduating seniors. You ask why we offer you such a good deal? Well, we feel that you graduates deserve a little something extra.

Sally: That's nice--what are you?.....(interrupted)

Mr. Blowhard: Well, we're offering some beautiful cookware at a very low cost. I'm sure you'll want to plan to purchase some of these for that hope chest that I'm sure a pretty girl like you has already started.

Sally: But I don't have a hope chest --

Mr. Blowhard: I was just coming to that. For a limited time only we are offering a free hope chest with the purchase of our cookware. You may ask--How can we afford to do this? Well, we feel high school seniors deserve a reward for their great accomplishment.

Sally: Oh, that's grand--what do I have to.....

Mr. Blowhard: We're offering style 6, 11, and 14 at a low $39.95 and style 14 is our saucepan set for only $3.98 down. Monthly payments are easy--just $2.50 a month--less than 10 cents a day.

Sally: When will I get my new hope chest?

---

[1]Developed by students of Mrs. Albie Rasmussen, Department of Family Economics, Kansas State University, Manhattan, Kansas.

Mr. Blowhard: It will be delivered with the first shipment. Due to our great response, it will probably be a month or so before delivery, but I'm sure your wait will be worth your while. Now, if you'll just sign here. (Sally signs) Thank you very much and I'm sure you'll be pleased.

Mr. Blowhard: (smiling, smirk) Goodbye, Miss Jones.

Sally: Goodbye, Mr. Blowhard, and thank you again.

(Sally is smiling and happy. Then suddenly she stops to think.)

Sally: How much does the whole set cost?
How can I get in touch with him? I didn't check his I.D.
Do I actually need this cookware?
Can I afford it now?
Can I stop the payments?
I wonder what the hope chest is like.

SECTION THREE: CONSUMER CITIZENSHIP
UNIT III: Fraud, Deception, and Quackery
III-5. Americans Spend Money on the Word "Free"[1]

(See Suggested Learning Experience No. 2, p. 127 in Part One)

Setting: Store counter

High school girl: (Runs in breathlessly) Is this where I pick up my free cologne?

Sales clerk: Yes, you get this exquisite cologne imported directly from Paris.

Girl: Gosh! That's an awfully small bottle.

Clerk: You know the old saying: The best things come in small packages.

Girl: What does it smell like? Sexy, I hope!

Clerk: (opens bottle and waves it in front of girl's nose) Heavenly, absolutely heavenly.

Girl: Oh! I can hardly wait to put some on.

Clerk: (businesslike) Now! What color makeup mirror would you prefer?

Girl: (surprised) Makeup mirror? What do you mean?

Clerk: The cologne is free with this lovely mirror which we are offering--today only--at an amazingly low price of $34.95.

Girl: $34.95? You've got to be kidding! I thought the cologne was free!

Clerk: It is free when you buy this lovely makeup mirror. It's a real bargain at $34.95! We have just a few left.

Girl: Well, I don't know.....

Clerk: A lovely young lady like you can't afford to be without this mirror that ordinarily sells for $49.95.

Girl: Really?

---

[1]Developed by students of Mrs. Albie Rasmussen, Department of Family Economics, Kansas State University, Manhattan, Kansas.

Clerk: That's a saving of $15 on the mirror. And the cologne sells at $20 an ounce. Now just sit down and let me show you the colors which we carry.

Girl: Well...I don't know..I really do like it though. (Sits down and starts looking at mirror.)

Clerk: Look! I'm not really a sales clerk at all. I'm one of the students in Family Economics. We want to demonstrate one of the many examples of advertising which tricks the consumer into thinking he's getting something for nothing.

Girl: (angry--jumps up) There ought to be a law against it!

Clerk: We do have the recently enacted Buyers Protection Act to protect consumers against frauds, but consumers have to help themselves by not believing deceptive advertising such as this which sounds as if you are getting something for nothing.

Girl: (hanging her head) I feel so foolish.

Clerk: You aren't the first consumer to bite on a "come-on" scheme like this. Americans spend millions of dollars on the word "free." (points to posters)

Girl: What a gyp! I came clear up here and what did I get--nothing!

Clerk: You got something better than a tiny bottle of cologne! You got a tip on how to be a better consumer. (hands girl a card) We hope the scented Family Econocard will remind you that a consumer must expect to pay a fair price for merchandise.

Girl: (reading on back of card) This is a real groovy motto. (reads back of card) The best protection against deception and fraud is an alert consumer.

Clerk: (to crowd) Thank you for coming to visit the Family Economics Department, and remember (points to sign and reads) Americans spend millions of dollars on the word "free."

-End-

4966

SECTION THREE: CONSUMER CITIZENSHIP
UNIT III: Fraud, Deception, and Quackery
III-6. Fasten Your Seat Belts But Hang Onto Your Money[1]

(See Suggested Learning Experience No. 2, p. 127 in Part One)

(Relax, enjoy yourself, ad lib.)

Salesman: Good morning lovely lady! I'm Mr. Blowhard from the Fly by Night Airline School.

Sally: But I've already planned on going to another airline school.

Salesman: I'm glad to hear of your interest in airline training. Now, our school will assure free placement service in a major airline. All of our graduates have been placed "somewhere." (gets out a contract and pen and places it in front of Sally)

Sally: I am going to attend the school sponsored by the airline which hires me.

Salesman: Of course, but a background in our school will give you poise, sophistication, and charm so essential to gracious living.

Sally: Uh huh? And what's this going to cost?

Salesman: First let me explain that our instructors have been selected from top echelon executives.

Sally: What's it going to cost?

Salesman: Only $350 for eight weeks!

Sally: How about living costs?

Salesman: The school maintains facilities at the Hilton Plaza at a slight nominal cost to the students.

Sally: But my Aunt Sally who flies for the airline which sponsors the school I plan to attend says the airline trains their own employees.

Salesman: (Chidingly) Now, you don't look like the kind of a girl who plods along in her old maid aunt's footsteps.

Sally: But my airline will pay me a salary while I'm being trained.

---

[1]Developed by students of Mrs. Albie Rasmussen, Department of Family Economics, Kansas State University, Manhattan, Kansas.

4957

Salesman: Think how much more you could get if you were trained by Fly by Night's top executives!

Sally: How much more!! That's just it!! You can't really promise me anything.

Salesman: Our school guarantees to place all their qualified graduates.

Sally: (In a huff) Well, I probably wouldn't qualify! And by the way my Aunt Sally is not an old maid. She's really cool! She's wised me up on Fly By Night Airline School. (Walks off indignantly)

Salesman: (Stands alone) That Sally's one girl who is too smart to fall for my line. Most girls fall for these way out promises. They end up spending good money without checking into the false promises. They sign a contract without reading and they're sorry later. They haven't been warned to

Fasten the seat belt
But hang onto your money!

SECTION THREE: CONSUMER CITIZENSHIP
UNIT III: Fraud, Deception, and Quackery
III-7. "In" Basket--"Out" Basket Situations

(See Suggested Learning Experience No. 3, p. 127 in Part One)

"In" Basket

Directions: Draw one of the situations from the "in" basket. Read the situation, then decide what you would do as a consumer. Use whatever resources you need to arrive at a solution.

Situations:
(1) A new "doctor" moves into your community. He advertises in the paper that he can cure all without surgery or X-rays.
(2) A local retail merchant puts an ad in the paper inviting consumers to come in and buy diamond watches at wholesale prices.
(3) Through the mail you have received a letter soliciting money to support a local training center for handicapped children. You are asked to pledge a monthly amount or to make one donation.
(4) You have received an unordered package through the mail. It contains greeting cards to sell.

"Out" Basket

Solutions: Write your decision for each situation on an "out" sheet and place in the "out" basket. Later share the solutions to each problem with classmates.

SECTION THREE: CONSUMER CITIZENSHIP
UNIT IV: Rights and Responsibilities
IV-1. Basic Consumer Rights

BASIC CONSUMER RIGHTS

THE RIGHT TO BE INFORMED

THE RIGHT TO SAFETY

THE RIGHT TO CHOOSE

THE RIGHT TO BE HEARD

4971

SECTION THREE: CONSUMER CITIZENSHIP
UNIT IV: Rights and Responsibilities
IV-2. Consumer Responsibilities

(See Suggested Learning Experience No. 5, p. 134 in Part One)

4972

TO BE INFORMED

TO BE INFORMED
Questions

If we as consumers have the right to be informed by education, business, and/or government, then we have certain responsibilities.

* What are some sources of information on goods and services? Where can information about recent developments and new products be found? How does the use of this information affect your right to be informed?

* What might be the results if many consumers asked for similar information not given about a particular product?

* If consumers have the right to be provided use and care instructions and performance claims, what responsibility accompanies this right? How could we lose this right?

* If advertisements inform, what is our responsibility in accepting or rejecting the information provided?

TO SAFETY

Examine products for safety features
Study care instructions before buying and using
Right to Safety
Inform retailers and/or manufacturers of poor performance
Study product safety ratings

TO SAFETY
Questions

If we as consumers have the right to be protected from the sale of goods and services that endanger our lives or safety, then we have certain responsibilities.

* How will we know if a product is safe? How do we influence the right to safety when we purchase goods without examining them first for safety features?

* What kind of information are we responsible for obtaining before purchasing goods or services?

* What should you do if the performance of goods or results of service are not safe? How would our right to safety be influenced if no one reported faults?

* How does the study of safety ratings help fulfill our responsibilities to our right to safety? What are some reliable sources of safety ratings? What makes them reliable sources? What might happen to these sources and our right to safety if we do not take advantage of the information offered to us?

TO CHOOSE

4977

TO CHOOSE
Questions

If we as consumers have the right to choose goods and services at fair and competitive prices, then we have certain responsibilities.

* What are some pressures that we should assume responsibility for resisting?

* How does buying from habit limit our ability to be selective? How does the responsibility to do comparative shopping affect the right to choose?

* How can one determine whether or not products or services are produced efficiently? What relationship is there between efficient production and fair and competitive prices?

* What are some products that represent a needless waste of limited natural resources? of human resources?

* In what ways are consumers dishonest in their dealings with merchants and repairmen? How does this affect the right to choose?

* What motivates you to buy the goods and services that you buy? How do your motivations affect other people's right to choose?

* What resources are available to you as a consumer? How does the use of these resources affect our right to choose?

TO BE HEARD

Right to be heard
Write Protest Letters
Write Congressmen
Know where to seek help
Let merchants know what is expected
Suggest product improvements
Suggest consumer legislation

TO BE HEARD
Questions

If we as consumers have the right to be heard, then we have the responsibility to keep channels of communications open between ourselves, business, and government.

* What should we do if we note irresponsible industries, merchants, and/or repairmen? How does the writing of protest letters help fulfill our responsibility to our right to be heard?

* Why is it our responsibility to know where to go for help? What do many consumers tend to do because they do not know where to go for help? How do their actions affect our right to be heard?

* One of our responsibilities is to suggest product improvements. Let's select a product or service and think of some suggestions for improvements of that product or service. (Send suggestions to company if they seem to be applicable or original.)

* How much information do you give merchants when you are shopping for a product or service? How does the information you give prior to purchasing goods or services help you to get what you want?

* Why is it important to write your congressmen about consumer problems? What difference does this make?

* Does the informed consumer have more right to be heard than one who is not informed? Why or why not?

4980

HOW ARE YOU GOING TO DO IT?

4981

PART TWO

SECTION FOUR: CONSUMER AND THE ECONOMY

4982

When there are many products, there has to be a place for the consumer to go to buy them. Here is where the retailer plays a role in the economy. He acts as a purchasing agent for the consumer. He buys from the manufacturer (directly or indirectly) and sells to the consumer. The consumer indicates which products will continue to be sold in the stores, and which will be dropped, by the "vote" he casts with each purchase.

The retailer, in turn, represents the voice of the consumer back to the manufacturer in terms of satisfaction or dissatisfaction.

Two terms used in discussing the economy of the country are:

GROSS NATIONAL PRODUCT (GNP)--this represents the total national production of goods and services at market prices--the dollar value of all goods and services produced in a year. In 1966 the figure was $759 billion--on 1975 it is predicted to be $1 trillion.

DISTRIBUTION OF
PERSONAL CONSUMPTION EXPENDITURES

Total consumption expenditures in 1966--
$465 billion

PERSONAL INCOME--income received by individuals from all sources.

This personal income is used for spending for--
Services
Durable goods
Nondurable goods
Personal savings
Taxes

DISTRIBUTION OF THE
PERSONAL INCOME DOLLAR

Total personal income in 1966--$580 billion

In our society--which is free and competitive, there are many responsibilities for the individual and for business to keep goods and services flowing.

Businesses have a responsibility to the consumer and the community.

(1) Supply the consumer with products and services that meet standards for satisfactory performance.
(2) Relay messages from the consumer to the manufacturer.
(3) Supply the consumer with information about products.
(4) And in the community he fulfills responsibility by donating to funds and charities, paying taxes, and providing jobs.

The consumer also has responsibilities. He has more freedom in our society to decide how he will spend his money than under any system--and this brings a great responsibility.

(1) He should stay informed of new products on the market
(2) Comparative shop
(3) Investigate credit
(4) Check labels and service offered
(5) And have a spending plan

Youth has an opportunity to exercixe the responsibility and independence he desires as he plays his role in the economic cycle. The responsibility of education is to help him understand this cycle and his place in it.

4986

SECTION FOUR: CONSUMER AND THE ECONOMY
UNIT III: Sources and Functions of Money
III-1. Two Sides of Money

(See Suggested Learning Experience No. 2, p. 149 in Part One)

4987

TWO SIDES OF MONEY[1]

People in Jobs

Earning

The history of the world is the record of a man in quest of his daily bread and butter.

--H.W. Van Loon
The Story of Mankind

As each person earns and spends, he satisfies his own individual needs and wants.

Collectively, through earning and spending, people promote the economic development, growth, and well-being of their nation.

People in the Marketplace

Spending

[1]Developed by Gerald A. Porter, University of Oklahoma, Norman, Oklahoma.

4989

FUNCTIONS OF MONEY

1. to serve as a means of payment.
2. to expedite the use of credit.
3. to serve as a standard, a guide to the measurement of the value of goods and services.
4. to serve as a storehouse of the value of goods and services produced.

PRODUCTION

Physical Resources

Land

Machines

Human Resources

Labor

Capital

DISTRIBUTION

Money constitutes a medium of communication as it facilitates the kinds distribution required to get products and services to the consumer in complex economic circumstances.

Money, like language a store of word and experience, acts also as a translator and as a transmitter. As the written word has advanced the separation of social functions, money has moved away from its original role as a store of work. It has separated itself from the commodity form and has become a vital specialist agent of exchange and a significant translator of human values.

FAMILY BUSINESS SITUATIONS

1. Children
2. Teen-agers
3. Young Adults
4. Middle Aged
5. Aged

The fundamental principles and basic functions of business are the same in a profit-making enterprise as they are in a family wage-earning situation. A family experiences the same kinds of financial successes and failures as does any business firm. The business firm or the family unit should practice good money management in terms of each of the major elements indicated above.

286

4990

SECTION FOUR: CONSUMER AND THE ECONOMY
UNIT III: Sources and Functions of Money
III-2. What Is Money?[1]

(See Suggested Learning Experience No. 2, p. 149 in Part One)

Over the long span of human history, money has assumed many forms and shapes. Different societies, at different times, have been willing to exchange goods or services for:

Seashells	Bricks	Beaver pelts
Whale's teeth	Coconuts	Blankets
Boar's tusks	Cocoa beans	Bronze axes
Stones	Iron rings	Wheels
Feathers	Salt	

In some of the South Pacific islands, great stone wheels served as money. Someone has said that those were the days when the men handled all the money. It took muscle to move a huge stone wheel.

In ancient Greece oxen were money; one ox was the basic money unit. When the Greeks introduced coins of gold and silver, this unit remained the basis for metal money, with each of the various coins worth different fractions of an ox.

In ancient Rome different things circulated as money. When the emperors were firmly established, they issued coins of gold and silver, and, throughout the Empire, their subjects used them. In addition, the Romans used pieces of bronze and copper that were not made into coins; Roman merchants had to weigh and test each piece every time they made a sale or purchase. In the early days of the Empire, however, Ceasar paid the legionnaires in cakes of salt, not metal, and the Roman emperors did this again, in the later days of the Empire, when they began to run out of metal. This custom may be the origin of the saying that a person is - or is not - "worth his salt."

The point is this: Any number of different materials - including paper I O U's - may serve as money. How money functions, and what money represents, are the important aspects of money. What material the money is made of is not an important aspect at all. In any society, people may use as money anything they wish, provided that they agree with other people throughout the society that the material they are using has the same meaning for all of them.

The question, "What is money?" can be answered briefly: MONEY IS ANYTHING THAT PEOPLE WILL ACCEPT IN EXCHANGE FOR GOODS OR SERVICES, IN THE BELIEF THAT THEY MAY IN TURN EXCHANGE IT, NOW OR LATER, FOR OTHER GOODS OR SERVICES.

V-1. Protect Your Checking Account

(See Suggested Learning Experience No. 10, p. 158 in Part One)

Individuals lose billions of dollars to forgers. Careful check-writing habits may protect you from forgers.

Your signature is the key to your banking account. Once your checking account signature becomes available, so do your finances. Use a clear-cut legible signature when signing checks. Plain, easy-to-read signatures are more difficult to forge than flourished illegible handwriting.

Your signature can be easily obtained, so use a different signature for banking than you do for other types of correspondence and business. If you normally sign your name, Jane Jacobs, sign your checks Jane C. Jacobs.

If you have imprinted checks, have them read J.C. Jacobs, but sign them Jane C. Jacobs. The forger will likely assume that your check imprint is the same as your signature and will forge incorrectly. Your bank should catch the inconsistency and return the check stamped "irregular signature."

When checks are to be mailed, cover your signature by folding either the check or another piece of paper on it. Lock up cancelled checks so your signature is hidden.

Print, do not write, the amount on the dollar line. Printed block style letters are the most difficult to alter. In the example, you can see that "two" was changed to "five."

In making out checks, try to use a fountain pen. Do not sign your checks with a lead or dry indelible pencil or a ballpoint pen. Do not sign your checks in your check book since the signature will imprint on the next check.

When writing a check, keep your bank balance stub covered. Do not tempt a potential forger.

Abbreviations are easy to alter. It is best to write out fully all names and companies.

Extend each entry to full width allotted. If necessary, draw a line or use dashes to completely fill the space. Additions or alterations can be placed in empty spaces.

The check artist has devised skillful ways of forging checks. Your caution with your checks and your signature will keep his hand out of your bank account.

V-2. Money Game[1]

(See Suggested Learning Experience No. 13, p. 158 in Part One)

Supplies Needed:

Slips of paper containing row letter terms and definitions (see list of terms and definitions on p. 296)

Container for slips

Master card for each game

Playing cards (1 for each player)

Dried beans

Persons Needed

Caller

Assistant to check master card

Players (any number)

Directions for Playing

1. The Money Game is played like Bingo.
2. The object of the Money Game is to spell money vertically, horizontally, or diagonally.
3. Each player receives a playing card. (Six sample playing cards are shown on pp. 300-302.)
4. Dried beans may be used to indicate terms on the card which have been used.
5. The center square on each card, labeled "MONEY" is a "free" space.
6. The caller will draw a slip from the container, read the row letter, then the definition of the term (see p. 296).
7. The assistant takes the slip from the caller and checks each term as it is used on the master card (see p. 299).
8. If a player thinks his playing card has the term which goes with the definition called, he places a bean on the square containing that term.
9. When a player has filled a complete row (vertically, horizontally, or diagonally) he calls "MONEY."
10. The caller stops the game and checks the player's card with the master card.
11. If the player's card checks with the master card, he becomes caller and a new game is begun. If the player's card fails to check with the master card, the game continues until another player calls "MONEY."

List of Terms and Definitions

ROW M

ANSWER:	CALLER READS:
Advertising	Use of media to promote sales
Media	Modern means of mass communication
Health	State of well-being
Profit	Gain or benefit
Loss	Lack of profit--no gain
Shelter	Home or housing
Transportation	Means of locomotion - carfare--auto--bus
Mortgage	Pledge of property to gain credit
Value	Worth of idea or property
Travel	Trip or journey away from home
Liabilities	Expenses & debts of a person

ROW O

ANSWER:	CALLER READS:
Disability	Illness or accident making one unable to work
Unemployment	Out of work
Consumer	One who buys or uses goods & services
Seller	One who offers goods for sale
Credit	Confidence in a person and/or ability to pay one's debts
Net pay	Amount of actual cash a worker receives after deductions
Insurance	Contract to pay a person in case of loss by fire, etc.
Deductions	Amount of money withheld from paycheck for taxes, etc.
F.I.C.A.	Federal Insurance Contribution Act

5000

Income	Amount of money earned
Resources	All assets of an individual
Savings & Loan Association	A bank that saves and lends money, usually for purchasing of property

ROW N

ANSWER:	CALLER READS:
Buyer	One who purchases an item
Goals	An end that one tries to reach
Recreation	Play, amusement, entertainment
Luxuries	Anything contributing to enjoyment but not a necessity
Contributions	Money given to a fund for special person or purpose
Community	Group of people living in same place
Taxes	Compulsory payments to government on income and property
Federal	United States government
State	The state in which you live
Local	The city or county in which you live
Assets	All of the property and income owned by a person

ROW E

ANSWER:	CALLER READS:
Savings	Amount set aside and not spent--amount in bank account
Corporation	A group of people organized to run a business
Stock	Shares bought in a company
Annuity	Investment that pays fixed yearly payment
Operating Expenses	Cost of running a home or business

Charity	Giving help to those in need
Retail	Sale of goods directly to consumer in small amounts
Wholesale	Sale of goods in large quantity to retailer
Interest	Money paid for use of another's money
Installment	Amount of money due regularly on a time purchase or loan
Loan	Money borrowed
Savings bank	An institution primarily for saving of money

ROW Y

ANSWER:	CALLER READS:
Fraud	Dishonest or deceitful means of doing business
Allowance	Amount of money given regularly to a person for needs
Budget	A plan for managing money
Rent	Set amount due regularly for use of property
Fixed expenses	Amount of money needed for regular expenses
Emergency fund	Amount set aside for unexpected expenses
Wages	Amount paid for labor
Down payment	First payment on an article bought on credit
Service charge	Amount of money paid for credit on time purchase
Pension	Amount paid to retired worker if a person has contributed or his company has contributed to an income retirement fund
Social Security	Federal Old Age Insurance Plan
Investment	Purchase of property, stocks or bonds in the hope of increasing value of money

SECTION FOUR: CONSUMER AND THE ECONOMY
UNIT V: Banks and Banking Services
V-3. Economic Jeopardy

(See Suggested Learning Experience No. 14, p. 158)

Preparation: Construct a large board with hooks on which to hang cards or use bulletin board tacks to hold cards (about 4" x 4"). Cards have a score on one side and either a question or an answer on the other side. Scores range from 10 to 60 under each category. Difficulty increases as scores increase. The following categories are used for Economic Jeopardy: Economics, Money, Marketing, and Banking. [NOTE TO TEACHER: Assign points to the questions according to the ability of students. Some cards on the board may contain a question--players give an answer in response. Some cards may contain an answer--players respond by giving the question. Sample questions and answers for each category are given on pp. 304-306.]

Divide into teams. Give each team member some type of noise maker for signaling his readiness to answer.

Rules of Play:

1. Employ some means of determining which team will select the first question.
2. The first team chooses a category and a level, e.g., Money for 40 points.
3. The card is turned over for all to read (may be read aloud) and any player who thinks he can answer the question signals using his noise maker.
4. If the player answers correctly, his team scores the value of that card. If he answers incorrectly, his team forfeits the value of the card and the other team is given the opportunity to answer the question.
5. Each time a team answers incorrectly, it forfeits the value of the card.
6. Play continues until all cards are turned over.
7. The team which has scored the most points at the end of the game wins.

5008

5007

CATEGORY: MONEY

Questions

1. What is money?
2. What is inflation?
3. What is bartering?
4. What can be used for commodity money?
5. What is real income?
6. What is price?
7. What is currency?
8. What is sound money?
9. What is a general decrease in prices?
10. What is money made by a person other than the Federal Government?

Answers

1. Anything accepted in payment for goods or services
2. A general increase in prices
3. Trading goods for goods
4. Tobacco leaves, furs, beads, cigarettes
5. The purchasing power of income or wages
6. The value of anything expressed in money terms
7. The coins and paper bills used as a means of payment
8. Money with fairly stable purchasing power
9. Deflation
10. Counterfeit

CATEGORY: BANKING

Questions

1. Who is someone who puts money in a bank?
2. What is a service charge?
3. What is a blank endorsement?
4. Who is the payee?
5. What is clearing?
6. What is a cashier's check?
7. What is investing?
8. What are dividends?
9. What are fixed-dollar investments?
10. What is the amount of money that has been invested?

Answers

1. A depositor
2. A fee paid for checking account service
3. An endorsement that permits a check to be cashed by anyone
4. The person to whom a check is written
5. The process of collecting payment for checks

5008

6. A check that a bank draws on its own funds
7. Putting savings to work earning income
8. A savings and loan association's payment to its savers
9. Investments that do not increase or decrease in dollar value
10. The principal

CATEGORY: ECONOMICS

Questions

1. What is the gross national product?
2. What are the factors of production?
3. What is production?
4. What is free enterprise?
5. What is profit?
6. What is mass production?
7. What is subsidy?
8. What is utility?
9. What is consumption?
10. What is capital?

Answers

1. The total amount that a nation produces during any year
2. Natural resources, labor, and capital
3. The principal function of business
4. A system in which individuals and business enterprises are allowed to make their own choices
5. The difference between what a business earns and the operating costs
6. Goods produced in large quantities
7. A government's financial assistance in private enterprises
8. Production which involves creating value
9. The act of using goods and services to satisfy needs and wants
10. Buildings and equipment used by workers to produce goods

CATEGORY: MARKETING

Questions

1. What are the functions of marketing?
2. What is the process of moving goods from producers to consumers?
3. What is a cooperative?
4. What is a monopoly?
5. What is merchandising?
6. What is a retail market?

5009

7. What is a business unit owned by the government?
8. Who is a wholesaler?
9. What is an individual proprietorship?
10. What is one step in the marketing process?

Answers

1. Tasks performed in the process of moving goods from the original producer to the point of final sale
2. Marketing
3. An enterprise owned by its customers
4. The ability to control the supply and price of goods or services
5. Process of filling demands for products
6. Final outlet in the distributing system
7. Government enterprise
8. A merchant who buys in large quantities for the purpose of selling smaller quantities of goods
9. An unincorporated business owned by one individual
10. Transportation

ABSTRACT - Developed during a University of Maryland School of Nursing project, reviewed by 10 practical nursing educators, and field tested in four schools, this program guide contains suggestions for planning a course to prepare licensed practical nurses for charge nurse responsibilities in nursing homes, extended care, and related facilities. Part I describes planning, implementing, and evaluating activities, including the role of the teacher and resource committee, scope of the program, funding, criteria for trainee selection, facilities requirements, brief description of the curriculum and standards, policies, and expectations. Part II contains materials and resources to be used in conducting the course, including guidelines and criteria for continuing education programs, charge nurse functions, sample application and evaluation forms, directory of publishers in the health care field, a bibliography, and guidelines to assess nurse manpower and health care facilities. The guide is designed to be used with the student text, which is available as VT 012 605 also in this issue. (SB)

PREFACE

CONTINUING EDUCATION

Practical nursing education is conditioned greatly by the changing and expanding complexity of health care. No program of basic preparation, whatever its type or quality, could possibly encompass all a practical nurse needs to maintain currency and relevancy to the developments in health care.

Education of practical nurses must be a continuing process. Acceptance of this fact imposes obligations upon individual practical nurses, their employers, the health professions, and practical nursing educators. The National Licensed Practical Nurses Educational Foundation, Inc., the nursing education and research arm of the National Federation of Licensed Practical Nurses - NFLPN, has defined continuing education for practical nurses as follows:

> Continuing education includes those organized educational experiences which are planned to help practical nurses achieve more productive and satisfying fulfillment of their roles as health workers. Such fulfillment should be of mutual benefit to both the practical nurse and to society, but should not be limited to preparing the practical nurse to meet the unique service needs of a single agency. Improved patient care is the primary goal of all continuing education of the LPN/LVN.

The contract between the Federation and the United States Public Health Service to develop materials to help with the preparation of LPN charge nurses for nursing homes, extended care, and related facilities is an example of a continuing education program for LPNs. Part II of the Guide contains the Federation's statements on "Continuing Education" and "Criteria for Continuing Education of the LPN/LVN," and "Ten Propositions Basic to Vocational Development."

THE PROJECT

Since the passage of PUblic Law 89-97, Title XVIII "Medicare" and Title XIX "Medicaid," and the subsequent conditions of participation and policy regulations, there has been considerable interest in the licensed practical nurse who works as a charge nurse in nursing homes, extended care, and related facilities.

In June, 1967 the Public Health Service awarded a grant to the University of Maryland School of Nursing to study the problem of preparing the LPN for these responsibilities. Project activities included review of the literature; survey of the functions of the charge nurse in an ECF; design, test, and evaluation of the curriculum; and the development of an Instructor's Guide. Mrs. Dorothy Justice, Assistant Professor and Chairman of the Practical Nurse Program at the University of Maryland School of Nursing, served as project director. The Instructor's Guide, Fundamentals of Nursing Management Skills for Licensed Practical Nurses Who Serve As Assistants to Registered Nurses in Extended Care Facilities was prepared by Linda A. Tarr, R.N., M.S.

5018

In June, 1969 the National Licensed Practical Nurses Education Foundation, Inc. received a contract from the Public Health Service to test, review, and revise the Instructor's Guide and to develop a textbook for use by LPN trainees. Major project activities included (1) review and testing of materials, and (2) revision and preparation of the publications.

A ten-member team of instructors from practical nurse education programs critiqued Guide materials prior to curriculum field test and following preparation of the Guide and Text drafts. Four schools used Guide materials to plan, conduct, and evaluate a continuing education program: "Preparation of LIcensed Practical Nurses for Charge Nurse Responsibilities in Nursing Homes, Extended Care, and Related Facilities:

Midwest City Public Schools
Midwest City, Oklahoma

Mount Sinai Hospital School of Practical Nursing
Miami Beach, Florida

New Orleans Public Schools
New Orleans, Lousiana

Southern Illinois University
Division of Technical and Adult Education
Carbondale, Illinois

Constant in each program were common objectives and quality of teaching faculty; hours of instruction and course format varied. The course was offered as a 10-day work conference at Southern Illinois University. Classes were three mornings a week for four weeks at Midwest City. The New Orleans program utilized Saturday mornings for 11 weeks with an intensive period of clinical application for five consecutive days the seventh week. The Mount Sinai program held some 30 classes Tuesday and Thursdays from 2 to 4 P.M. In most settings, trainees returned to their places of employment for applied clinical practice. Plans for coordination and supervision of trainees varied. In one program all trainees utilized a common agency for experience. Participating faculty included:

Mrs. Ruth Killough and Mrs. Sandy Mitchell
Midwest City Public Schools

Mrs. Carmen Ross and Mrs. Alice Gutterman
Mount Sinai Hospital School of Practical Nursing

Dr. Edwina Frank and Mrs. Anna Goldman
New Orleans Public Schools

Mrs. Beatrice Chiodini
Southern Illinois University

Nelly B. Oles of Community Health Service of the U. S. Public Health Service was Project Officer; Teresa M. Crowley, Executive Director of NLPNEF, served as Project Coordinator. Sandra Rasmussen directed the project and prepared the Instructor's Guide and Trainee Text.

INTRODUCTION

This Guide contains suggestions to help you plan, implement, and evaluate a course to prepare licensed practical nurses for charge nurse responsibilities in nursing homes, extended care, and related facilities.

The suggestions are intended to help you develop a course similar in content and quality to other programs throughout the country, yet flexible and particular to the needs of your immediate community.

Part I of the Guide describes activities necessary for planning, implementation, and evaluation of the LPN charge nurse course. A complete sample course including objectives and activities is included.

In Part II of the publication you will find materials and resources that might prove useful as you set up and conduct the course.

This Guide and the suggestions contained herein are specific for use with the book The LPN Charge Nurse: Trainee Text and Study Guide.

The author acknowledges the assistance of Federation staff, faculty review team, participating instructors, and many others whose efforts and encouragement helped make this publication possible.

Sandra Rasmussen

Part I

PLANNING, IMPLEMENTATION, AND EVALUATION ACTIVITIES

THE IDEA

A variety of factors prompt communities to begin a LPN charge nurse course. Local, regional, or State Public Health Officials may initiate the idea as they try to implement Medicare and Medicaid health programs. Nursing home directors, often through their associations, may request such a course. The licensed practical nurse association or vocational-technical educators responsible for continuing education may suggest the idea. Or a group of citizens concerned about long-term care and specifically the area's needs for nursing home personnel may organize into a committee and make their wants known.

THE TEACHER

Usually one person, most frequently a practical nurse educator, assumes major responsibility for coordinating the planning, implementation, and evaluation of the course. The teacher should be a registered professional nurse with experience and interest in long-term care and practical nurse education. Qualifications for employment should be similar to requirements for employment in the agency sponsoring the course. The teacher must hold a current license as a registered nurse.

A well prepared teacher is one of the most important factors for program success. The quality of the program is to a great extent dependent upon the teacher and her abilitis. Part II of the Guide contains a statement describing "Characteristics of Teachers in the Health Care Field."

TASK FORCE OR RESOURCE COMMITTEE

Once initial interest in the development of a LPN charge nurse course is apparent, an advisory committee should be convened. The "advisory" committee should be a working committee, and a more appropriate name might be Task Force or Resource Committee. Individuals involved in comprehensive health planning and/or regional medical programs, as well as any existing group or committee working with or interested in long-term care and practical nurse education should be involved. Duplication of effort must be avoided. Key representatives on the Resource Committee should be:

- Public Health officials responsible for Medicare/Medicaid Programs
- vocational-technical educators
- administrators and directors of nursing from nursing homes, extended care, and related facilities
- licensed practical nurses

The committee should be broad in membership yet small enough to work together. If possible it should include citizens: influential community leaders, the consumer of long-term care health services, and people from various health associations and community groups.

The task force should identify its purpose and major functions. In most cases it will function in a liaison capacity between the program and the community. It plays a key role in effective public relations. The task force should be active through all major program

phases: planning, implementation, and evaluation. For example, it may survey local health care institutions to determine the actual need for LPN charge nurses. It may assist with curriculum development; it may prove instrumental in locating cooperating clinical agencies. The task force may assist with follow-up studies of trainees. It plays an important role in on-going evaluation of the program and participates in planning necessary changes.

STANDARDS, POLICIES, AND EXPECTATIONS

Licensing and accreditation standards relative to the LPN as charge nurse in hospitals, nursing homes, extended care, and related facilities must be reviewed. The teacher should study Chapter 4 "Settings for Long-term Care" from The LPN Charge Nurse: Trainee Text and Study Guide thoroughly. She must obtain and read rules and policies governing licensing of institutions as well as the conditions of participation in Medicare and Medicaid programs. Public health personnel can be of great assistance to the teacher in explaining and interpreting standards.

The teacher must acquaint herself with policies operative in institutions in immediate area. She must become familiar with expectations nurses themselves, both the registered nurse and the licensed practical nurse, have regarding their role as charge nurse in long-term care institutions.

SCOPE OF THE PROGRAM

The teacher and task force must outline the scope of the program, that is, a clear understanding of what the program is and what the program is not. Perhaps it is most useful to circulate as a fact sheet the Statement of Functions of the LPN Charge Nurse (see Part II) explaining that these functions constitute program objectives, goals, and expected behavioral competencies.

It is wise to anticipate some of the questions that will be asked. Licensed practical nurses often ask, "will this course remove a waiver?" "Is this a medication course?" Administrators may ask, " will this help my institution qualify for Medicare/ Medicaid participation?"

A clear, emphatic description of the scope of the program is necessary for effective planning and implementation. Other programs and courses can be established to meet additional service and educational needs.

THE NEED

The teacher and/or task force should document the actual need for LPN charge nurses in the area before the program is planned and implemented. Public health personnel, State employment services, as well as health care institutions in area may help supply this information. Both short-term and long-term needs should be identified. Part II contains a form "Guidelines to Assess Nurse Manpower Supply and Demand" that should prove helpful.

THE TRAINEES

The licensed practical nurse association can prove helpful in contacting its membership to determine interest among LPNs in such a course. The nursing home association or administrators of nursing homes and similar institutions directly, can supply similar information about prospective trainees.

Criteria for acceptance of applicants for the course must be established. LPNs most likely to benefit from the program should be accepted first:

1. The LPN who is a graduate of a State-approved School of Practical Nursing, who is a charge nurse at present.

2. The LPN who is a graduate of a State-approved School of Practical Nursing, who is planning to be a charge nurse in the near future.

3. The waivered LPN who is a charge nurse at present.

4. The waivered LPN who is planning to be a charge nurse in the near future.

Part II of the Guide contains several sample letters and forms the teacher might find useful in her contacts with administrators to explain the program and obtain trainees:

- "Application
- "Endorsement"
- "Evaluation: The LPN Charge Nurse"
- "Agreement"

It is extremely important that administrators and directors of nursing have and understand the Statement of Functions of the LPN Charge Nurse.

FUNDING

The actual sponsorship of the LPN charge nurse course will vary from State to State, community to community. It is highly desirable that vocational-technical education acknowledge continuing education as a priority and undertake the responsibility for such a course. In some cases funds may come from comprehensive health planning and/or regional medical programs. A special grant may be obtained. Funding and sponsorship may come from local and/or State health associations, especially the nursing home associations or licensed practical nurse association. Monies might be securred directly from public health.

Initial funding and plans for additional courses must be worked through before program planning begins. If funds are available for a single program only, the program should be designated as a demonstration or experimental course.

Depending upon the arrangements that can be made for use of existing classroom and clinical facilities, major program costs will be for personnel: the teacher and secretarial assistance. Office and classroom supplies, communication expenses (mailings and telephone charges) are other specific program expenses.

FACILITIES

Both classroom and clinical facilities are required to implement the LPN charge nurse program. The education focus of the course will be enhanced if some of the program is offered in a "school" setting. Course schedules (late afternoon, evenings, or Saturdays) may permit utilization of existing classrooms. If the course is viewed as an integral part of the educational program, the teacher and trainees should have welcome access to existing classrooms and laboratories, the library, cafeteria, as well as audio-visual equipment and materials.

There is a tendency among health care facilities to offer their agencies for clinical experience rather than conduct an educational program of their own. Clinical experience is a necessary dimension of the course. Part II of the Guide contains "Guidelines to Assess Health Care Facilities and Services." This should help the teacher survey and select suitable clinical facilities.

Specific program needs include a conference room for discussion/conversational teacher-trainee learning. The teacher should have an office or office space that includes a telephone and typewriter; her contacts with the community are many. Secretarial assistance and duplication services should be convenient.

EDUCATIONAL RESOURCES

Each trainee should purchase the book The LPN Charge Nurse: Trainee Text and Study Guide. The teacher may recommend the purchase of two additional books by the trainees or, if budget permits, make these books available for use in the library:

> Nursing Care Planning by Dolores E. Little and Doris L. Carnevali. Philadelphia, Lippincott, 1969.
>
> A Handbook for Head Nurses by Doris A. Geitgey. Philadelphia, Davis, 1961.

Both of the above books are available in paperback; the Geitgey book will be in a second edition shortly.

Three films are recommended for use:

> "Mrs. Reynolds Needs a Nurse"
>
> "The Eye of the Beholder"
>
> "The Inner Man Steps Out"

These may be available free from your State Department of Health. Other sources of free or rental films include:

American Journal of Nursing, Educational Services Division
10 Columbus Circle
New York, New York 10019

Abraham Krasker Memorial Film Library
Boston University, School of Education
765 Commonwealth Avenue
Boston, Massachusetts 02215

Additional educational resources for both teacher and trainee use are suggested in Part III of the Trainee Text and in Part II of this Guide. A "Directory of Major Publishers in the Health Care Field" is included in Part II.

EVALUATION

Course evaluation begins with program planning. Evaluation must be on-going and periodic. It should be an accepted and shared responsibility among the teacher, the trainees, and the employer.

The employer and the trainees should complete the form, "Evaluation: The LPN Charge Nurse" at the beginning of the course. The teacher, the trainees, and the employer should again complete the form at the completion of the course, and if possible at three and six month intervals thereafter. A "Trainee Evaluation of Course" is found in Part II.

Evaluation information is needed to plan necessary changes or improvements in the course. Frequently the sponsor wants to know "if anything happened" because of the course.

Evaluation will be one of many ways to document to the employer, the trainees, and the teacher the value of the program and to what extent course objectives were met.

If possible, the teacher should request the terminal and the three and six month evaluations from the trainees and employers in person. If this proves difficult, a friendly explanatory letter and copy of the form should be mailed. At all times the importance and necessity of the evaluation should be stressed.

CURRICULUM

The curriculum has eleven major units. These correspond directly with the chapters in the book The LPN Charge Nurse: Trainee Text and Study Guide.

INTRODUCTION

THE LICENSED PRACTICAL NURSE

MEDICARE AND MEDICAID

PATIENTS ARE PEOPLE

SETTINGS FOR LONG-TERM CARE

INTRODUCTION - The LPN Charge Nurse

PLANNING PATIENT CARE

COORDINATING STAFF ACTIVITIES

IMPLEMENTING PATIENT CARE

EVALUATING PATIENT CARE

CONCLUSION

OBJECTIVES (Goals; Expected Behavioral Competencies) and ACTIVITIES (Teaching, Learning, Evaluation Activities) have been identified for each unit.

As indicated in the Preface, course hours and format varied from program to program. The initial University of Maryland course was 84 hours and most of the curriculum field test projects were similar. The "shortest" course was 60 hours, the ten-day work conference. Course time includes both classroom and clinical experiences.

Self-motivation and self-direction on the part of the trainees is crucial for program success. Trainees are expected to read, study, and complete the Text and Study Guide. Trainees are involved directly in the classroom learning process and in planning their clinical experiences.

The teacher may or may not be able to guide application of learnings in the clinical area. This in large part will depend on location of trainees and cooperating agencies. Because the trainee is preparing for a leadership role in which evaluation is a key dimension, self-evaluation of clinical application by the trainee herself is sound. When this can be combined by teacher evaluation, the activity proves more worthwhile.

Part II of the Guide contains several forms that might help the teacher as she plans, implements, and evaluates the curriculum: "Who is My Trainee?" "Charge Nurse Functions - a test," "Evaluation: The LPN Charge Nurse," "Role Playing Situations," and "Trainee Evaluation of Course."

The following pages contain a "sample course." The teacher is encouraged to adapt and change the format and organization in whatever ways necessary to meet specific objectives for the LPN charge nurse course in her community.

OBJECTIVES (Goals; Expected Behavioral Competencies)	ACTIVITIES (Teaching, Learning, Evaluation Activities)
INTRODUCTION	
- understands course objectives and activities	Trainee: - introduce self - describe work setting, kinds of patients, and present responsibilities - discuss course expectations - take "test" Charge Nurse Functions - complete form Evaluation: The LPN Charge Nurse - discuss anything of importance Teacher: - introduce self - describe course objectives and activities - give "test" and self-evaluation (see Part II) - answer questions about course - assign Chapter 1 "The Licensed Practical Nurse" from The LPN Charge Nurse: Trainee Text and Study Guide
THE LICENSED PRACTICAL NURSE	
- develops a working definition of nursing - understands the functions and qualifications of the LPN	Trainee: - discuss facts and feelings about nursing - review functions and qualifications of the LPN

2030
6029

OBJECTIVES	ACTIVITIES
- understands the unique contribution the LPN is making to long-term patient care	- view film "Mrs. Reynolds Needs a Nurse" and discuss - discuss contribution LPN is making to long-term patient care - share learnings from Study Guide Teacher: - guide discussion as necessary - assign Chapter 2 "Medicare and Medicaid" from The LPN Charge Nurse: Trainee Text and Study Guide
MEDICARE AND MEDICAID - understands purpose of Medicare and Medicaid programs - understands the similarities and differences in the Medicare and Medicaid programs - explains the Medicare and Medicaid programs to others	Trainee: - discuss purpose of Medicare and Medicaid programs - discuss similarities and differences in Medicare and Medicaid programs - question teacher and/or resource people about programs - role play situations suggested in Study Guide Teacher: - guide discussion as necessary - obtain resource people involved directly with Medicare and Medicaid programs to explain programs - assign Chapter 3 "Patients are People" from The LPN Charge Nurse: Trainee Text and Study Guide

2058

5030

OBJECTIVES	ACTIVITIES
PATIENTS ARE PEOPLE - understands that patients are people - understands the characteristics, needs, and role of the LPN relative to older people - understands the characteristics, needs, and role of the LPN relative to children and adults with chronic conditions	Trainee: - visit with older adults - note characteristics of older adults - discuss needs of older adults - discuss role of the LPN in caring for older adult patients - visit with individual with long-term illness - note characteristics of individual with long-term illness - discuss needs of children and adults with chronic conditions - discuss role of LPN in caring for individuals with chronic conditions - share learnings from Study Guide Teacher: - guide discussion as necessary - invite an older man and woman, and a child and/or adult with a chronic illness to class (guests may or may not be "patients;" an informal session with refreshments is suggested) - assign Chapter 4 "Settings for Long-term Care" from The LPN Charge Nurse: Trainee Text and Study Guide

2035 5031

OBJECTIVES	ACTIVITIES
SETTINGS FOR LONG-TERM CARE	
- understands the concept progressive patient care - knows the kind of patient that should receive care in a hospital - knows the kind of patient that should receive care in an extended care facility - knows the kind of patient that should receive care in an intermediate care facility - knows the kind of patient that should receive care in a nursing home	Trainee: - question panel of nurses about institutions and patients - discuss similarities and differences in institutions and patients - discuss the role of the LPN in each institutional setting - share learnings from Study Guide Teacher: - guide discussion as necessary - organize a panel of four RNs, one each from a hospital, ECF, intermediate care facility, and nursing home to discuss the institution and patients - assign Chapter 5 "Introduction" to Part II in The LPN Charge Nurse: Trainee Text and Study Guide - ask trainees to bring job description of charge nurse to class
INTRODUCTION - The LPN as Charge Nurse	
- understands the need for LPNs as charge nurses in settings for long-term care - understands the functions of LPN charge nurses	Trainee: - discuss each job function: what does it mean? why is it important? - compare jobs functions from various institutions - review self-evaluation form completed first day of class - share learnings from Study Guide

5032

74 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

OBJECTIVES	ACTIVITIES
	Teacher:
	- guide discussion as necessary
	- assign Chapter 6 "Planning Patient Care" from The LPN Charge Nurse: Trainee Text and Study Guide
	- suggest Chapters 1-5 from Nursing Care Planning and Chapter 1 from A Handbook for Head Nurses
PLANNING PATIENT CARE	
- demonstrates awareness of the comprehensive nature of long-term care	Trainee:
- understands the condition, needs, and therapeutic goals of each patient	- discuss each function in detail
	- view film "The Eye of the Beholder" and discuss
- receives and interprets verbal and written reports about patient care	- shares learnings from Study Guide
	- discuss suggested readings
- makes nursing rounds to observe and determine patient needs	- plan clinical experiences for each function
- assists the physician with examinations and treatments	- apply learnings in clinical area; evaluate performance
- discusses patient care goals with physician, nursing supervisor, and staff	Teacher:
	- guide discussion as necessary
- develops nursing care plans for individual patients	- help plan clinical experiences for each function
	- guide application of learnings in clinical area; evaluate performance
	- assign Chapter 7 "Coordinating Staff Activities" from The LPN Charge Nurse: Trainee Text and Study Guide
	- suggest Chapters 9, 10, 11 from Nursing Care Planning and Chapters 10 and 13 from A Handbook for Head Nurses

0039

0039

OBJECTIVES	ACTIVITIES
COORDINATING STAFF ACTIVITIES	
- exhibits an understanding of basic human behavior - demonstrates fundamental leadership techniques - uses management principles and procedures - communicates verbally and non-verbally; listens, speaks, reads, writes, gestures effectively - motivates staff to give skilled nursing care to all patients	Trainee: - discuss each function in detail - view the film "The Inner Man Steps Out" and discuss - discuss learnings from Study Guide, especially goal-setting exercise - discuss suggested readings - plan clinical experiences for each function - apply learnings in clinical area; evaluate performance Teacher: - guide discussion as necessary - assist as necessary with goal-setting exercise - help plan clinical experiences for each function - guide application of learnings in clinical area; evaluate performance - assign Chapter 8 "Implenting Patient Care" from The LPN Charge Nurse: Trainee Text and Study Guide - suggest Chapters 6 and 8 from Nursing Care Planning and Chapters 2 - 9 from A Handbook for Head Nurses - ask trainees to bring chart forms, report forms, requisitions, as well as stated policies, procedures, and routines

2039
5034

OBJECTIVES	ACTIVITIES
IMPLEMENTING PATIENT CARE	
- develops plans to meet on-going needs of all patients	Trainee:
- develops plans for common types of emergency situations	- discuss each function in detail
- assigns personnel in terms of patient needs and staff proficiencies	- study materials brought to class (chart and report forms, procedures and routines)
- helps staff care for patients with special needs, the patient with mental illness, the dying patient	- role play the situation between Yvonne Foley, LPN charge nurse and Helen Phillips, nurses' aide
- coordinates work with that of other departments such as dietary, housekeeping, physical and occupational therapy, social service	- tape record a team conference or tour of duty report you lead or give; study the recording; bring to class if possible
- seeks guidance and assistance when problems are beyond scope	- share learnings from Study Guide
- prepares and gives verbal and written reports about patients: conferences, nurses' notes, tour of duty and special reports	- discuss suggested readings
	- plan clinical experiences for each function
	- apply learnings in clinical area; evaluate performance
	Teacher:
	- guide discussion as necessary
	- evaluate usefulness of forms and procedures brought to class with trainees
	- plan role playing situation (See Part II for materials)
	- analyze tape recordings with trainees
	- help plan clinical experiences for each function
	- guide application of learnings in clinical area; evaluate performance

5035

OBJECTIVES	ACTIVITIES
	- assign Chapter 9 "Evaluating Patient Care" from The LPN Charge Nurse: Trainee Text and Study Guide - suggest Chapters 7 and 12 from Nursing Care Planning and Chapters 11, 12, and 14 - 17 from A Handbook for Head Nurses
EVALUATING PATIENT CARE	
- applies basic principles of evaluation - makes nursing rounds to observe and assess patient care and needs - assesses patient care given by staff and guides appropriate changes - appraises self-performance and plans improvement	Trainee: - discuss each function in detail - share learnings from Study Guide - discuss suggested readings - plan clinical experiences for each function - apply learnings in clinical area; evaluate performance Teacher: - guide discussion as necessary - help plan clinical experiences for each function - guide application of learnings in clinical area; evaluate performance
CONCLUSION	
- evaluates course objectives and activities	Trainee: - take "test" Charge Nurse Functions - complete form Evaluation: The LPN Charge Nurse - complete form Trainee Evaluation of Course - discuss expectations from course

2032

5036

OBJECTIVES	ACTIVITIES
	- discuss course objectives and activities
	- discuss anything of importance and interest
	<u>Teacher</u>:
	- give "test," self-evaluation, and course evaluation forms (see Part II)
	- discuss expectations from course with trainees
	- discuss course objectives and activities with trainees
	- discuss anything of importance and interest

Part II

MATERIALS AND RESOURCES

5038

CONTINUING EDUCATION

Continuing Education includes those organized educational experiences which are planned to help practical nurses achieve more productive and satisfying fulfillment of their roles as health workers. Such fulfillment should be of mutual benefit to both the practical nurse and to society, but should not be limited to preparing the practical nurse to meet the unique service needs of a single agency.

Guidelines for Continuing Education Programs

1. Every constituent State or local division or unit should have an education committee, and a budget allotment with which to carry out the function of the committee.

2. Exploration of the resources of a State or area is an essential step in locating cooperative help for planning and carrying out a continuing education program. Look to the allied health organizations, the nursing home association, regional medical groups, the State vocational education department, junior/community colleges and nursing organizations for assistance.

3. Leadership for educational programs should be selected from the best qualified, highly competent persons available.

4. The purpose of an educational program should be defined and the objectives stated clearly.

5. The curriculum for a continuing education program should meet the learning needs of the participants, build upon basic preparation, incorporate contemporary curriculum theory and be reviewed periodically.

6. Facilities for continuing education programs may require creative exploration. Hiring expensive rooms is not necessary. The possibilities of using adult education centers, vocational schools, junior/community colleges, Savings and Loan Association meeting rooms or those in health care agencies, clubs, community centers and parish houses should be investigated. Any one of them in a community may have meeting-room space available without a charge or for a modest fee.

7. Education Methods - Few continuing education programs are educationally effective if the instruction is limited to reading a paper or giving a lecture. A variety of participative methods and new educational media should be utilized in the program.

8. The title of a program should be selected with care. A sub-title may identify further its contents.

9. Advance information should be sent to participants which will prepare them for involvement in the content of any program and will insure accurate expectations.

10. Evaluation - Plans for evaluation of the program should be made to determine whether or not objectives have been met. Participant evaluation should be solicited at the close and desirable, some time after the program. Suggestions for improvement should be encouraged.

0002 5039

CRITERIA FOR CONTINUING EDUCATION OF THE LPN/LVN

Continuing Education includes those organized educational experiences which are planned to help practical nurses achieve more productive and satisfying fulfillment of their roles as health workers. Improved patient care is the primary goal of all continuing education of the LPN/LVN.

I. TO REMOVE A WAIVER

1. A program in each State providing opportunity for removal of the waiver administered by an educational institution with the approval of the State board of nurse examiners and the cooperation of LPN associations.

2. Consideration and evaluation of the competence gained by work experience and continued learning of the LPN in meeting requirements of the program.

3. Provision of counseling services as an integral part of the program.

4. No limitations on age for admission to the program.

5. Provision of financial assistance when required.

II. TO IMPROVE PRACTICE

1. Varied opportunities for continuing education geographically and financially accessible to all LPNs.

2. Wide dissemination of information about learning opportunities in the areas.

3. Cooperative efforts of educational institutions, division, State and national nursing and health organizations, and health care agencies in development of programs.

4. Motivation of LPN/LVNs towards continuing education.

III. TO CHANGE A CAREER GOAL

1. Admission to higher education institutions available to all LPN/LVNs for systematic study.

2. Guidance in planning a change in career goal provided by educational institutions.

3. Consideration and evaluation of the competence and knowledge gained through work and life experience in meeting the requirements of the program.

4. Provision of financial assistance where required.

NATIONAL FEDERATION OF LICENSED PRACTICAL NURSES, INC.

5040

TEN PROPOSITIONS BASIC TO VOCATIONAL DEVELOPMENT

1. People differ in their abilities, interests, and personalities.

2. They are qualified, by virtue of these characteristics, each for a number of occupations.

3. Each of these occupations requires a characteristic pattern of abilities, interests, and personality traits, with tolerances wide enough, however, to allow both some variety of occupations for each individual and some variety of individuals in each occupation.

4. Vocational preferences and competencies, the situations in which people live and work, and hence their self concepts, change with time and experience (although self concepts are generally fairly stable from late adolescence until late maturity), making choice and adjustment a continuous process.

5. This process may be summed up in a series of life stages characterized as those of growth, exploration, establishment, maintenance, and decline, and these stages may in turn be subdivided into (a) the fantasy, tentative, and realistic phases of the exploratory stage, and (b) the trial and stable phases of the establishment stage.

6. The nature of the career pattern (that is, the occupational level attained and the sequence, frequency, and duration of trial and stable jobs) is determined by the individual's parental socio-economic level, mental ability, and personality characteristics, and by the opportunities to which he is exposed.

7. Development through the life stages can be guided, partly by facilitating the process of maturation of abilities and interests and partly by aiding in reality testing and in the development of the self concept.

8. The process of vocational development is essentially that of developing and implementing a self concept; it is a compromise process in which the self concept is a product of the interaction of inherited aptitudes, neural and endocrine make-up, opportunity to play various roles, and evaluations of the extent to which the results of role playing meet with the approval of superiors and fellows.

9. The process of compromise between individual and social factors, between self concept and reality, is one of role playing, whether the role is played in fantasy, in the counseling interview, or in real life activities such as school classes, clubs, part-time work, and entry jobs.

10. Work satisfactions and life satisfactions depend upon the extent to which the individual finds adequate outlets for his abilities, interests, personality traits, and values; they depend upon his establishment in a type of work, a work situation, and a way of life in which he can play the kind of role which his growth and exploratory experiences have led him to consider congenial and appropriate.

From Vocational Development: A Framework for Research by Donald E. Super and others. New York, Teachers College Columbia University, 1957.

CHARACTERISTICS OF TEACHERS IN THE HEALTH CARE FIELD

Enthusiastic interest in learning and in contributing to knowledge of health care and of teaching.

A high level of knowledge and competence in the area of teaching within the health care field and interest in maintaining such.

A broad liberal education background on which to draw for personal and professional growth and development.

Knowledge and comprehension of teaching role and relationships in the institutional setting and a willingness to participate in the activities required by the role.

Ability to participate in defining new teaching roles demanded by changing goals of education and society in health care and education.

Ability to evaluate and apply knowledge of current health programs, problems and trends to the prediction of probable trends in medical practice, health care, and education in the health professions and occupations.

Ability to utilize knowledge of historical, philosophical, social, political, and economic concepts and trends in the functioning as a faculty member.

Enthusiasm for sharing knowledge in ways which stimulate others to pursue knowledge and skills.

Ability to synthesize knowledge of the learner and the theories of learning and instruction for organization and presentation of content and experiences.

Ability to involve the learner in developing effective ways of learning and continuing to learn.

Ability to relate to students and colleagues in education and health care services.

Skill, understanding and insight into dynamics of human behavior with the ability to initiate, maintain, and terminate relationships.

Understanding of the growth process in students; ability to guide students through learning to examine and/or re-examine values.

THE LICENSED PRACTICAL NURSE AS CHARGE NURSE

A Statement of Functions

The qualified licensed practical nurse who functions as charge nurse on certain tours of duty in nursing homes, extended care, and related facilities performs the following functions:

1. PLANS PATIENT CARE

- demonstrates awareness of the comprehensive nature of long-term care
- understands the condition, needs, and therapeutic goals of each patient
- receives and interprets verbal and written reports about patient care
- makes nursing rounds to observe and determine patient needs
- assists the physician with examinations and treatments
- discusses patient care goals with physician, nursing supervisor, and staff
- develops nursing care plans for individual patients.

2. COORDINATES STAFF ACTIVITIES

- exhibits an understanding of basic human behavior
- demonstrates fundamental leadership techniques
- uses management principles and procedures
- communicates verbally and non-verbally; listens, speaks, reads, writes, gestures effectively
- motivates staff to give skilled nursing care to all patients.

3. IMPLEMENTS PATIENT CARE

- develops plans to meet on-going needs of all patients
- develops plans for common types of emergency situations
- assigns personnel in terms of patient needs and staff proficiencies
- helps staff care for patients with special needs, the patient with mental illness, the dying patient
- coordinates work with that of other departments such as dietary, housekeeping, physical and occupational therapy, social service
- seeks guidance and assistance when problems are beyond scope
- prepares and gives verbal and written reports about patients: conferences, nurses' notes, tour of duty and special reports.

4. EVALUATES PATIENT CARE

- applies basic principles of evaluation
- makes nursing rounds to observe and assess patient care and needs
- assesses patient care plans and modifies as necessary
- assesses patient care given by staff and guides appropriate changes
- appraises self-performance and plans improvement.

GUIDELINES TO ASSESS NURSE MANPOWER SUPPLY AND DEMAND

1. Staff (each facility and total)

   Registered Nurses: number and kind

   Licensed Practical Nurses: number and kind

   Aide/Assistants: number and kind

2. Inactive nurses in area

   Registered Nurses: number and kind

   Licensed Practical Nurses: number and kind

   Aide/Assistants: number and kind

3. Unfilled budgeted positions (each facility and total)

   Registered Nurses: number and kind

   Licensed Practical Nurses: number and kind

   Aide/Assistants: number and kind

4. Turnover (each facility and total)

   Registered Nurses: number and kind

   Licensed Practical Nurses: number and kind

   Aide/Assistants: number and kind

5. What competitive factors affect nurse manpower supply?

6. What is the mobility of nurse manpower in and out of the area?

7. What nurse manpower needs will result fron new or planned health facilities?

8. What are the budgeted nurse manpower positions for new facilities (each facility and total)?

   Registered Nurses: number and kind

   Licensed Practical Nurses: number and kind

   Aide/Assistants: number and kind

William Lamont, Administrator
Franklin Hospital Skilled Care Unit, E.C.F.
201 Bailey Lane
Benton, Illinois 62812

Dear Mr. Lamont:

Southern Illinois University, Division of Technical and Adult Education, is presenting a ten-day work conference entitled: Preparation of Licensed Practical Nurses for Charge Nurse Responsibilities in Nursing Homes, Extended Care, and Related Facilities. Please refer to the enclosures for more details.

The need for such a course has been called to our attention; therefore, we anticipate cooperation from the institutions in this locality.

We are interested to know approximately how many LPNs you employ as charge nurses. Also, how many of your personnel would you be willing to send, to participate in this course? Please reply promptly so that you can be sent application blanks and other forms for these people.

Please note that a registration fee of $10.00 (ten dollars) has been requested from each participant. We have particular reasons for requiring this: (1) to "guarantee" registration and participation, (2) to "psychologically" convince the participants of the worth of the course, and (3) to allow purchase of trainee supplies. Therefore, if in your generosity, you would desire to pay the fee, we recommend that you forestall this until after the trainee has successfully completed the course.

Replies are to be sent to:

Mrs. Beatrice Chiodini, R.N.
Practical Nursing
Vocational Technical Institute
Southern Illinois University
Carbondale, Illinois 62901

Benton, Illinois 62812

Dear Mr. Lamont:

Thank you for your interest in our work conference, "Preparation of Licensed Practical Nurses for Charge Nurse Responsibilities in Nursing Homes, Extended Care, and Related Facilities." I am happy to clarify the requirements.

We plan to accept LPNs most likely to benefit from this program; so, in considering applicants, we will evaluate them in this order:

1. The LPN who is a graduate of a State-approved School of Practical Nursing, who is a charge nurse at present.

2. The LPN who is a graduate of a State-approved School of Practical Nursing, who is planning to be a charge nurse in the near future.

3. The waivered LPN who is a charge nurse at present.

4. The waivered LPN who is planning to be a charge nurse in the near future.

Should any further clarification be needed, please do not hesitate to contact me.

Sincerely,

Beatrice D. Chiodini, R.N.
Instructor

Franklin Hospital Skilled Care Unit, E.C.F.
201 Bailey Lane
Benton, Illinois 62812

Dear Mr. Lamont,

We are pleased that you are interested in our course for LPN charge nurses. Also, we are happy to know that your Director of Nursing and your LPNs are interested.

I am enclosing three (e) each of the following forms: "Application," "Endorsement," and "Evaluation: The LPN Charge Nurse." Please return these to me as soon as possible, so that I can advise you about their acceptance.

Sincerely,

Beatrice D. Chiodini, R.N.

Franklin Hospital Skilled Care Unit, E.C.F.
201 Bailey Lane
Benton, Illinois 62812

Dear Mr. Lamont,

We are pleased to inform you that three licensed practical nurses from your institution have been selected as trainees for the LPN charge nurse course.

We believe this kind of a continuing education program is a shared responsibility between the sponsoring school and the employing institution. Therefore, would you study and sign the enclosed "Agreement."

Thank you for your interest and cooperation.

Sincerely,

Beatrice D. Chiodini, R.N.

Date:_____

Name:_____

Present Position:_____

EVALUATION: THE LPN CHARGE NURSE

Name of LPN Charge Nurse_____Date_____

Directions:

1. Read each criterion (job function).
2. Recall a specific behavior as an example of the function.
3. Using the behavior example, evaluate the performance of the LPN charge nurse as unsatisfactory, satisfactory, good or out-standing.
4. Guide action (changes, improvements).

Definitions:

UNSATISFACTORY: performance below licensing and accreditation standards, ward and institution policies, and LPN and supervisor expectations; change or improvement required.

SATISFACTORY: performance meets licensing and accreditation standards, ward and institution policies, and LPN and supervisor expectations; change or improvement necessary.

GOOD: performance above licensing and accreditation standards, ward and institution policies, and LPN and supervisor expectations; change or improvement suggested.

OUT-STANDING: performance above and beyond licensing and accreditation standards, ward and institution policies, and LPN and supervisor expectations; no change or improvement suggested; work to maintain high quality performance.

CRITERIA	EVALUATION			
	Unsatisfactory	Satisfactory	Good	Out-standing
1. PLANS PATIENT CARE				
- demonstrates awareness of the comprehensive nature of long-term care				
- understands the condition, needs, and therapeutic goals of each patient				
- receives and interprets verbal and written reports about patient care				
- makes nursing rounds to observe and determine patient needs				
- assists the physician with examinations and treatments				
- discusses patient care goals with physician, nursing supervisor, and staff				
- develops nursing care plans for individual patients				
2. COORDINATES STAFF ACTIVITIES				
- exhibits an understanding of basic human behavior				
- demonstrates fundamental leadership techniques				
- uses management principles and procedures				
- communicates verbally and non-verbally; listens, speaks, reads, writes, gestures effectively				
- motivates staff to give skilled nursing care to all patients				

5052

AGREEMENT

_____ (sponsoring school)

and

_____ (employing institution)

The _____ agrees to release _____ _____, LPN from her regular duties to attend all scheduled classes and clinical instruction for the LPN charge nurse course. The course will be offered the following time and place: _____ _____

The employing institution agrees to provide opportunities, under the supervision of the Director of Nurses, for the above named LPN, to utilize learnings obtained through the course.

_____ agrees to provide the Administrator and Director of Nurses, or her designate, with background materials about the course.

Signed:

Date _____ _____
Administrator, Employing Institution

Date _____ _____
Director of Nurses, Employing Institution

Date _____ _____
Teacher, LPN Charge Nurse Course

GUIDELINES TO ASSESS HEALTH CARE FACILITIES AND SERVICES

1. Select a variety of facilities to assess.

2. Identify facility

   - Name
   - Address
   - Telephone
   - Contact person

3. Ascertain control

   - Public
   - Voluntary non-profit
   - Profit-making

4. Verify licensure, accreditation, or approval

5. Identify services offered

6. Ascertain patient characteristics

   - Number
   - Age
   - Sex
   - Type of care
   - Place of residence
   - Pay status

7. Examine facility

   - Patient care or services provided
   - Equipment and supplies
   - Instructional facilities
   - Eating facilities
   - Records
   - Accessibility, transportation, and parking
   - Personnel

8. Determine educational orientation

   - Use of facility by students (professional, technical, vocational)

     .. Kind of students
     .. Number
     .. Extent of facility use (space and duration)

   - Special research programs

- Inservice education program

  .. Initial orientation
  .. Continuing education

- General attitude toward:

  .. Education
  .. Patients
  .. LPNs

9. Determine understanding and acceptance of program by:

   - Administration/management
   - Key personnel, for example, directors, managers, and supervisors
   - LPNs

10. Enter into appropriate written agreements

    - State the purpose of the agreement
    - Identify special responsibility of the facility
    - Identify special responsibility of the program
    - Identify mutual responsibilities for LPN Charge Nurse Program and trainees
    - State effective dates and renewal conditions of agreement
    - Indicate arrangement for cooperative planning by facility and program
    - Include specific facility and program provisions for the following:
      .. formal responsibility for educational program
      .. extent of use of facility by program
      .. handling of disciplinary problems
      .. procedure for clearing assignment of trainees to facility
      .. extent to which facility provides resource persons for program
      .. health procedures to be followed for trainees
      .. emergency care for teachers and trainees while in facility
      .. class, conference room space, office space for teachers
      .. locker room facilities, eat facilities, parking
      .. extent of compliance of trainees and teachers with facility rules, regulations
      .. legal protection for trainees and teachers while in agency.

TRAINEE EVALUATION OF COURSE

1. What did you find most useful about the course?

2. What did you find least useful about the course?

3. What did you enjoy most about the course?

4. What did you enjoy least about the course?

5. What changes would you suggest for the next course?

6. What improvements would you suggest for the next course?

7. Please offer specific comments and suggestions about the classroom learnings:

8. Please offer specific comments and suggestions about the clinical learnings:

9. Please offer specific comments and suggestions about educational resources: personnel, materials, and media.

10. Additional comments and suggestions.

WHO IS MY TRAINEE?

INDIVIDUAL DIFFERENCES

Why should I be concerned with individual differences?

In what ways might I use my knowledge of trainee individual differences?

How will individual trainee differences influence achievement?

In what ways might I use knowledge of developmental tasks of different age groups to assist trainee learning?

TRAINEE CHARACTERISTICS

Who is my trainee?

What do I need to know about her/him before I can plan or guide learning experiences?

What will I do with what I learn about her/him?

- Age
- Educational background
- Former/present employment
- Career goal
- Family status
- Maintenance/financial resources and needs
- Personal and character references
- Health status
- Academic potential (test scores)
- Level of maturity
- Concept of role of LPN charge nurse
- Motivation or reason for becoming a LPN; reason for entering the LPN charge nurse program

2023

CHARGE NURSE FUNCTIONS

Directions: Circle the letter of the best answer.

1. The major function of the charge nurse in the nursing home is to

   a. see that the work is done.
   b. supervise the aides.
   c. see that necessary supplies are available.
   d. see that patients receive good nursing care.

2. The charge nurse on evenings seldom has enough linen. She should

   a. make joint plans with the day charge nurse for linen use.
   b. hide extra linen on good days so she will have enough later.
   c. complain to the Director of Nursing Service.
   d. request the administration to purchase more linen.

3. The charge nurse on day duty notes that two of her aides are taking longer and longer breaks. She should

   a. ask why they are not working well.
   b. ask them to report to the charge nurse every time they leave the floor.
   c. make a note about it and report to the Director.
   d. plan to work with them to see why they have so much time.

4. The family reports that grandpa will not eat. The charge nurse says to the patient

   a. Why won't you eat?
   b. Was there something about your meal that you didn't like?
   c. You have upset your family by not eating.
   d. The doctor says you must eat to keep your strength up.

5. The charge nurse overhears two aides talking. One says, "There goes 202's light again. What does she want now!" The nurse should

   a. go and check the patient.
   b. ask the aide what the problem is.
   c. disconnect the buzzer light.
   d. correct the aide for not calling the patient by name.

6. The charge nurse notices that the number of disposable pads used goes up and up. She should

   a. ask the aides why so many are being used.
   b. tell the aides not to use so many pads.
   c. determine why so many patients are incontinent.
   d. have the aides sign out for each pad.

7. The night charge nurse finds that a patient must be changed again just as her shift is ending. She should

   a. tell the day charge nurse what happened.
   b. ask the aide to do it as a favor to her.
   c. ask the day charge nurse for an aide to help the night aide.
   d. find out why the bed was not changed earlier.

8. The evening charge nurse comes on duty after two days off. The day nurse tells her that everyone is the same and gets ready to go. The evening nurse should

   a. read the report book before the day nurse goes.
   b. ask the day nurse to go over the Kardex with her.
   c. tell the day nurse that you will get the report from the book and nurses' notes.
   d. ask the day nurse what is new since the evening nurse was last there.

9. Mrs. Green is a newly employed aide who has been assigned to the unit. Which is the best description of what the beginning aide can do? She can

   a. do simple nursing measures.
   b. do those things which an ordinary person could do at home.
   c. function as an assistant to the nurse.
   d. perform the duties assigned by the charge nurse.

10. What do people want <u>most</u> from their jobs? They want

   a. appreciation for their efforts.
   b. a good amount of money.
   c. a chance to do a good job.
   d. new and different experiences.

11. What is the best solution to the problem presented by this patient? "Why don't you ever remember that I want my newspaper before I get up in the morning?"

   a. don't worry about it - a nursing home is not the place for maid service.
   b. tape a note to the bed stating "give newspaper early in morning."
   c. use nursing care plan to notify staff.
   d. ask night nurse to get a paper for him at 6 A.M.

12. How can you find out if the aides are giving good emotional support to the patient?

   a. observe the behavior of patients.
   b. observe the patients and aides together.
   c. ask the patients if they are happy.
   d. ask the aides if they are providing emotional support.

13. The aide states that her patient is so deaf that he can't communicate. The nurse gives this advice: try to

   a. speak louder.
   b. stand right in front of him.
   c. speak right into his ear.
   d. ask family if the patient has a hearing aid.

14. What statement about leaders is true?

   a. "Leaders are born, not made."
   b. "Everyone is a leader at times."
   c. "Leaders should not issue flat orders."
   d. "A good leader is a friend to all under her."

15. The charge nurse tells an aide, "Get Mr. Pitts up." Later she finds him in bed. The charge nurse should ask

    a. Mr. Pitts, "Did the aide get you up?"
    b. the aide, "Why didn't you get Mr. Pitts up?"
    c. the aide, "Has Mr. Pitts been up yet?"
    d. Mr. Pitts' roommate, "Did the aide get Mr. Pitts up?"

16. The best definition of Extended Care Facility is a government certified nursing home

    a. which provides skilled nursing care and specialized services.
    b. where skilled nursing care is provided.
    c. for Medicare patients.
    d. specializing in chronic diseases.

17. The charge nurse makes rounds on all the sick patients. How should she note the information she observes?

    a. take the Nursing Notes with her.
    b. make notes to use later.
    c. make a mental note to remember what she finds.
    d. take the Kardex with her.

18. Mrs. Thompson is awake night after night crying for her daughter. The night charge nurse should

    a. get another repeat sedation order.
    b. ask the day staff to keep her up during the day.
    c. get permission for the daughter to stay all night.
    d. ask her supervisor to help solve the problem.

19. The relief charge nurse is assigned to pass medications on the "senile" floor. The patients do not wear armbands. How can the nurse be sure that medications are given to the right patients?

    a. ask each patient his name before giving the medication.
    b. ask an aide who knows the patients to give the medications the charge nurse pours.
    c. put all patients to bed and take a floor plan with her.
    d. ask an aide who knows the patients to accompany her on medication rounds.

20. The nursing home inaugurates an unpopular policy. In announcing it to her staff the charge nurse should

    a. let the staff know that that is the rule and it is the charge nurse's job to enforce it.
    b. suggest that the staff take up their grievances with the administration.
    c. show that she is aware of the policy's unpopularity but suggest a trial period.
    d. make it clear that she disapproves of the ruling and won't really enforce it.

21. A person who requires "bed and board" should receive institutional care in a/an

    a. hospital.
    b. extended [illegible]cility.
    c. intermediate care facility.
    d. nursing home.

Directions: Answer the next few questions as if you were the charge nurse. Use a few words; it is not necessary to use complete sentences.

22. What is an Extended Care Facility?

23. The charge nurse notices bath towels and sheets missing from unit linen inventory. What should she do?

24. What do people want most from their jobs?

25. Mrs. Stone is blind. How should the charge nurse tell a high school student to feed her?

26. Mrs. Allport likes to eat two soft-boiled eggs for lunch but she only gets them when you are on duty. What can you as charge nurse do about this?

27. A fire breaks out in a wastebasket in a patient's room. What should the charge nurse do?

28. The aides are complaining that they have too many baths to do every morning. The office cannot assign any more aides to the unit. How can the charge nurse best solve the problem?

29. As charge nurse, you must assign some extra work to one of two aides. One aide is a personal friend of yours. How should the assignment be made?

30. Mr. Wong who speaks only Chinese has just been admitted. How can the charge nurse and staff communicate with him?

31. Mrs. Jackson is 83 and has moderage congestive heart failure. The doctor calls and asks how she is doing. What should the charge nurse check to determine the patient's condition?

ROLE FOR YVONNE FOLEY, LPN CHARGE NURSE

Maryland Nursing Home is a fifty-bed Extended Care Facility located in a town of about 25,000 people. It has a transfer agreement with City General Hospital.

The majority of the patients are admitted from the hospital rather than from home. The institution has been open for three years and many of the patients have been here for that period of time. Many of the patients have more than one chronic condition such as congestive heart failure, arthritis, arteriosclerosis; some have terminal cancer. In addition many have disabilities which add to their daily living problems such as senility, cataracts, deafness, and incontinence.

Many facilities and specialists are available at this ECF including a physical therapy department, an occupational therapy department, visiting specialists such as a social worker, dentist, podiatrist, an active volunteer group and visiting clergy.

The nursing staff is very interested in their patients and they are working together to improve patient care.

The scene today takes place on the 3-11 shift on Wing B. You are Yvonne Foley, the LPN charge nurse, and you are about to make patient care assignments. You try to assign personnel in terms of patient needs and staff proficiencies.

Alan Weaver is a 74-year old retired railroad employee in room 12. His conditioned has worsened during the day. Mr. Weaver has terminal carcinoma of the liver. Shortly after 1 P.M. he slipped into a deep sleep, his pulse rate increased from 74 to 98, and his blood pressure dropped from 120/90 to 90/70. The doctor has seen Mr. Weaver and believes death is pending.

Helen Phillips is your most experienced, dependable nurses' aide. She joined the staff two years ago. Before this she worked as a nurses' aide for 10 years in an outlying rural hospital. She is 43 years old; her husband manages a local filling station. They have five children: a married daughter with two children, a son in the Navy, a son in his second year in college, and a girl and boy in high school.

Mrs. Phillips attended a vocational education class on long-term care in preparation for employment at Maryland Home. She is a skilled, personable employee and you intend to recommend her for the LPN training program.

You have ample staff to meet the needs of the entire ward. Because Mrs. Phillips is the most qualified aide for the task, you assign her to stay with Mr. Weaver for the entire tour of duty. You review his condition with her, his needs, and her functions. This is an important nursing assignment.

ROLE FOR HELEN PHILLIPS, NURSES' AIDE

Maryland Nursing Home is a fifty-bed Extended Care Facility located in a town of about 25,000 people. It has a transfer agreement with City General Hospital.

The majority of the patients are admitted from the hospital rather than from home. The institution has been open for three years and many of the patients have been here for that period of time. Many of the patients have more than one chronic condition such as congestive heart failure, arthritis, arteriosclerosis; some have terminal cancer. In addition many have disabilities which add to their daily living problems such as senility, cataracts, deafness, and incontinence.

Many facilities and specialists are available at this ECF including a physical therapy department, an occupational therapy department, visiting specialists such as a social worker, dentist, podiatrist, an active volunteer group and visiting clergy.

The nursing staff is very interested in their patients and they are working together to improve patient care.

The scene today takes place on the 3-11 shift on Wing B. Yvonne Foley, the LPN charge nurse, is about to make patient care assignments. You are Helen Phillips, a nurses' aide. You joined the staff two years ago. Before this you worked as a nurses' aide for 10 years in an outlying rural hospital. You are 43 years old; your husband manages a local filling station. You have five children: a married daughter with two children, a son in the Navy, a son in his second year in college, and a girl and boy in high school.

You attended a vocational education class on long-term care in preparation for employment at Maryland Home. You like your work very much and pride yourself on being considered one of the most experienced, dependable aides.

You know that work with long-term care and geriatric patients means caring for patients with terminal illness. You have cared for dying patients before as an aide in the general hospital and here at the home, but you have never been alone with a person who died and you are afraid of this situation. You are ashamed of this fear and have never mentioned it to your charge nurse or the other aides. At times the fear has proved awkward, but so far you have always managed to have another aide or nurse with you when you cared for a dying person or for the body after death.

You are anxious to get ahead on the job; Maryland Home will sponsor several aides for LPN training and you want to be selected. You have managed to hide this fear of being alone with a dying person from your charge nurse and you hope she never finds out because it might jeopardize your reputation as an out-standing aide and hurt your chances of her recommendation for LPN training. Abnormal fears aren't things that people understand and you might be considered neurotic.

If the charge nurse should ask you to be alone with a dying person, give excuses, try to get out of it. But do not tell her about your fear unless she asks you - and then wait 30 seconds before you answer. If she insists, you will refuse and quit your job.

ABSTRACT - Developed during a University of Maryland School of Nursing project, reviewed by 10 practical nurse educators, and field tested in four schools, this trainee text contains information designed to prepare students for charge nurse responsibilities in nursing homes, extended care, and related facilities. Part I, The Licensed Practical Nurse (LPN) and Long-Term Care, contains background information about: (1) The LPN Today, (2) Medicare and Medicaid, (3) Patients, and (4) Settings for Long-Term Care. Part II, The LPN as a Charge Nurse, discusses the nurse's role in these chapters: (1) Introduction, (2) Planning Patient Care, (3) Coordinating Staff Activities, (4) Implementing Patient Care, and (5) Evaluating Patient Care. Part III, Educational Resources, lists related books, articles, and audiovisual aids. Each illustrated chapter contains two sections, one offering basic information about the topic and the other study activities. The instructor's manual is available as VT 012 604 also in this issue. PREFACE

CONTINUING EDUCATION

Practical nursing education is conditioned greatly by the changing and expanding complexity of health care. No program of basic preparation, whatever its type or quality, could possibly encompass all a practical nurse needs to maintain currency and relevancy to the developments in health care.

Education for practical nurses must be a continuing process. Acceptance of this fact imposes obligations upon individual practical nurses, their employers, the health professions, and practical nursing educators. Practical nurses must continue to increase and enrich their competencies by whatever means are most appropriate.

The National Licensed Practical Nurses Educational Foundation, Inc., the nursing education and research arm of the National Federation of Licensed Practical Nurses, defines continuing education as follows:

> Continuing education includes those organized educational experiences which are planned to help practical nurses achieve more productive and satisfying fulfillment of their roles as health workers. Such fulfillment should be of mutual benefit to both the practical nurse and society, but should not be limited to preparing the practical nurse to meet the unique service needs of a single agency. Improved patient care is the primary goal of all continuing education of the LPN/LVN.

This text is a result of a continuing education project between the Foundation and the U. S. Public Health Service.

THE PROJECT

Since the passage of Public Law 89-97, Title XVII "Medicare" and Title XIX "Medicaid," and the subsequent conditions of participation and policy regulations, there has been considerable interest in the licensed practical nurse who works as a charge nurse in nursing homes, extended care, and related facilities.

In June, 1967 the Public Health Service awarded a grant to the University of Maryland School of Nursing to study the problem of preparing the LPN for these responsibilities. Project activities included review of the literature; survey of the functions of the charge nurse in an ECF; design, test, and evaluation of the curriculum; and the development of an Instructor's Guide. Mrs. Dorothy Justice, Assistant Professor and Chairman of the Practical Nurse Program at the University of Maryland School of Nursing, served as project director. The Instructor's Guide, Fundamentals of Nursing Management Skills for Licensed Practical Nurses Who Serve As Assistants to Registered Nurses in Extended Care Facilities was prepared by Linda A. Tarr, R.N., M

3075

In June, 1969 the National Licensed Practical Nurses Education Foundation, Inc. received a contract from the Public Health Service to test, review, and revise the Instructor's Guide and to develop a textbook for use by LPN trainees. Major project activities included (1) review and testing of materials, and (2) revision and preparation of the publications.

A ten-member team of instructors from practical nurse education programs critiqued Guide materials prior to curriculum field test and following preparation of the Guide and Text drafts. Four schools used Guide materials to plan, conduct, and evaluate a continuing education program: "Preparation of Licensed Practical Nurses for Charge Nurse Responsibilities in Nursing Homes, Extended Care, and Related Facilities:

Midwest City Public Schools
Midwest City, Oklahoma

Mount Sinai Hospital School of Practical Nursing
Miami Beach, Florida

New Orleans Public Schools
New Orleans, Lousiana

Southern Illinois University
Division of Technical and Adult Education
Carbondale, Illinois

Constant in each program were common objectives and quality of teaching faculty; hours of instruction and course format varied. Participating faculty included:

Mrs. Ruth Killough and Mrs. Sandy Mitchell
Midwest City Public Schools

Mrs. Carmen Ross and Mrs. Alice Gutterman
Mount Sinai Hospital School of Practical Nursing

Dr. Edwina Frank and Mrs. Anna Goldman
New Orleans Public Schools

Mrs. Beatrice Chiodini
Southern Illinois University

Nelly B. Oles of Community Health Service of the U. S. Public Health Service was Project Officer; Teresa M. Crowley, Executive Director of NLPNEF, served as Project Coordinator. Sandra Rasmussen directed the project and prepared the Instructor's Guide and Trainee Text.

5076

INTRODUCTION

This book is for you to read, study, and enjoy. It contains information, study activities, and a listing of educational resources that should help you prepare for charge nurse responsibilities in nursing homes, extended care, and related facilities.

Each chapter of the book has two sections. The first section offers basic information about the topic. The second section is a study and work section. In most cases this text will be used in conjunction with a continuing education course to prepare LPNs for charge nurse roles. However, the book is valuable by itself as a text and study guide.

Part I contains background information about the LPN and long-term care. This may be a review for you if you have been employed for some time in a long-term care setting. It may offer new and current information about (1) The LPN Today, (2) Medicare and Medicaid, (3) Patients, and (4) Settings for Long-term Care.

Part II introduces you to the LPN charge role. Chapter 5 contains a Statement of Functions for the LPN Charge Nurse. Subsequent chapters describe in detail each function: (6) Planning Patient Care, (7) Coordinating Staff Activities, (8) Implementing Patient Care, and (9) Evaluating Patient Care.

A listing of related books and articles will be found in Part III. Audio-visual materials that might prove useful to you and your staff for inservice education programs have been included.

Many LPN-patient photos supplement the printed material. Photo credits go to Donald Bulucos of Chicago, Joel M. Snyder of Chicago, and the Holy Ghost Hospital of Cambridge, Massachusetts.

The author acknowledges Mrs. Etta B. Schmidt, Executive Director of the National Federation of Licensed Practical Nurses, and many others for their assistance and encouragement throughout this project.

Part I

THE LICENSED PRACTICAL NURSE AND LONG-TERM CARE

5079

Chapter 1

THE LICENSED PRACTICAL NURSE

NURSING

Every individual must satisfy certain basic human needs to live, to maintain health, and to affirm his being. The acting, thinking, feeling, relating, believing individual is the healthy person.

Nursing is the act of assisting a healthy, handicapped, ill, or dying person to meet his basic needs for life, health, and being. A nurse is a man or woman who is willing and able to provide a direct health service of helping to people.

Nurses help people in the home, at school, at work, and throughout the community plan, promote, and maintain health. Sometimes illness interferes with a person's ability to care for himself; nurses care for sick people at home and in a variety of institutions such as hospitals, nursing homes, extended care facilities, physicians' offices, and clinics.

2081

Figure 1-1. Nursing.

5080

FUNCTIONS AND QUALIFICATIONS OF THE LPN

The following Statement of Functions and Qualifications of the Licensed Practical Nurse was prepared and approved by the Executive Board of the National Federation of Licensed Practical Nurses in June 1970. The National Federation of Licensed Practical Nurses is the membership organization for licensed practical/vocational nurses and is the recognized policy-making body for LPN/LVNs.

The Statement reflects the expanding role of the LPN in today's health care system. It provides flexibility in the functions of the LPN who has obtained additional knowledge and skills through continuing education and nursing experience. The Statement will serve as a guide for nursing service directors for maximum utilization of LPNs and for nurse educators for the development of curriculum in schools of practical nursing as well as the design of continuing education programs for the LPN.

PURPOSE

The identification of the role of the Licensed Practical Nurse[1] which is intended to serve as a guide to:

- The maximum utilization of the licensed practical nurse in nursing services.
- Self-evaluation of nursing practice by the licensed practical nurse.
- Development and evaluation of educational standards for the professional preparation of the licensed practical nurse, and
- The interpretation of licensing legislation.

ROLE AND RATIONALE

The work of the licensed practical nurse (LPN/LVN) is an integral part of nursing. Under the direction of a qualified autonomous health professional, the licensed practical nurse is a recognized member of the health-care team and performs nursing functions commensurate with her education and demonstrated competencies. On a selective basis, this will include the performance of a wide range of nursing activities.

For purposes of this Statement, nursing activities encompass situations ranging from:

- providing direct patient care at the bedside in relatively stable nursing situations such as hospitals, extended care units, nursing homes, private homes, and other health care facilities and agencies.

5081

[1] The title LPN is the same as LVN in California and Texas.

2080

- to performing nursing functions in semi-complex situations, such as hospital nursing service units, recovery rooms and labor rooms;

- to more complex situations, such as hospital nursing service units, intensive or coronary care units and emergency rooms;

- to the promotion of personal and community health--an important function of all well prepared members of the health-care team;

- to promoting and carrying out preventive measures in community health facilities such as well-baby clinics, out-patient clinics and services.

In semi-complex and complex nursing situations a greater depth of knowledge and a higher level of judgment is required of the LPN; and a closer working relationship with, and the greater the degree of direction by, the autonomous health professional.

The determination of the capabilities of the LPN in complex nursing situations should be arrived at through:

- an evaluation of the nursing needs of the patient;

- a realistic appraisal of the elements within the situation (e.g. the complexity of scientific principles underlying the functions and techniques to be carried out);

- the ability of the LPN to perform in the situation based on his knowledge, skills and previous experience;

- the amount and character of the direction needed by, and available to the LPN, in the performance of the functions and procedures.

EDUCATION

The LPN should be qualified for nursing practice through:

1. Preparation in a formal educational program in practical nursing approved by the appropriate nursing authority in a State.

2. Initial orientation within the employing institution.

3. Inservice and continuing education for all nursing practitioners to maintain competencies; and, for those who qualify, to gain additional competencies which will enable them to broaden their scope of nursing practice within the employing agency by the performance of specialized activities.

DO NOT FILM THIS PAGE

Figure 1-2. The expanding role of the LPN in today's health care system.

2085

5083

LEGAL STATUS

1. The LPN must be currently licensed to practice practical nursing according to State law, and

2. Must perform within the limits of preparation and experience.

PERSONAL QUALIFICATIONS

1. Recognizes and has a commitment to meet the ethical, moral and legal obligations of the practice of practical nursing.

2. Maintains and promotes good health practices.

3. Actively promotes and participates in nursing organizations, inservice education programs, workshops, institutes and other educational and community activities.

FUNCTIONS

The LPN is prepared to function as a member of the health-care team by exercising sound nursing judgment based on preparation, knowledge, skills, understandings and past experiences in nursing situations.

The LPN participates in the planning, implementation and evaluation of nursing care in all settings where nursing takes place. The following illustrate the types of activities performed:

1. Direct Patient Care

(in hospitals, extended care units, nursing homes, private homes and other related health facilities)

a. Provides for the emotional and physical comfort and safety of patients through:

(1) The understanding of human relationships between and among patients, families and other health-care personnel.

(2) Participation in the development, revision, and implementation of policies and procedures designed to insure comfort and safety of patients and other health-care personnel.

(3) Assisting the patient with activities of daily living and encouraging appropriate self-care.

(4) Recognizing and understanding the effects of social and economic problems upon patients.

(5) Protecting patients from behavior that would damage their self-esteem or relationship with families, other patients, or persons.

(6) Recognizing and understanding cultural backgrounds and spiritual needs, respecting and religious beliefs of individual patients.

(7) Considering needs of the patient for an attractive, comfortable and safe environment.

b. Observes, records and reports to the appropriate persons:

(1) General and specific physical and mental conditions of patients, and signs and symptoms which may be indicative of change.

(2) Stresses in human relationships between patients, patients' families, visitors and health care personnel.

c. Performs more specialized nursing functions for which the LPN is prepared, such as:

(1) Administration of medications and therapeutic treatments prescribed for the patient.

(2) Preparation and care of patients receiving specialized treatments.

(3) Carrying out first aid, emergency and disaster measures.

d. Assists with rehabilitation of patients, according to the patient care plan, through:

(1) Knowledge and application of the principles of prevention of deformities, (e.g. the normal range of motion exercises, body mechanics and body alignments).

(2) Encouragement of patients to help themselves within their own capabilities.

(3) Awareness of and encouraging the fulfillment of the special aptitudes and interests of patients.

(4) Utilizing community resources and facilities for continuing patient care.

2. Patient Care Management

The licensed practical nurse, with additional preparation in specialized areas and under direction of autonomous health professionals is qualified to:

a. Supervise other nursing and health-related personnel.

b. Coordinate and make assignments of other nursing and health-related personnel and patients.

c. Serve as team leader.

d. Serve as charge nurse.

3. Community Health

The licensed practical nurse contributes to community health through nursing activities performed outside patient-care institutions, e.g. visiting nurse associations, well-child and other public health clinics, and industrial nursing units.

4. Individual Citizens of the Community

The licensed practical nurse participates in activities which promote the community's attitudes and welfare in health care. As a private citizen, the LPN,

a. Utilizes community resources to promote a better understanding of the health services among the general public, and

b. Promotes and participates in community health projects and other health oriented activities.

THE LPN AND LONG-TERM CARE

Licensed practical nurses are prepared to nurse patients effectively in nursing homes, extended care, and related facilities. LPNs qualify through education and experience to meet the needs of long-term care patients: the majority of stated functions of the LPN relate to direct patient care.

EDUCATION

Learning to meet the nursing needs of older persons and individuals who need long-term care is an integral part of the curriculum of most State-approved schools of practical nursing. All practical nursing students study Medical Nursing and care for a variety of patients with long-term care conditions.

In addition to Medical Nursing, most LPN students study Geriatric Nursing. The Geriatric Nursing Course typically includes learnings about (1) physical, mental, emotional, social, and spiritual characteristics of older adults, (2) the aging process, and (3) conditions of illness of older persons. Most of these students have nursing experience with older persons in general hospitals; approximately one-half of the practical nursing programs in the country provide opportunity for student learning in nursing homes and extended care facilities.

An increasing number of practical nursing schools are including a unit on long-term care in their curricula. Topics for study emphasize chronic disease, the characteristics and needs of patients with long-term illnesses, and patient rehabilitation.

Figure 1-3. Most students have nursing experience with older persons.

ROLE AND FUNCTIONS

A re-examination of the Statement of Functions and Qualifications of the Licensed Practical Nurse documents the competencies of the LPN for care of the long-term patient. The first nursing activity states:

> providing direct patient care at the bedside in relatively stable nursing situations such as hospitals, extended care units, nursing homes, private homes, and other health care facilities and agencies;

The Statement describes the major activity of the LPN as direct patient care. The LPN

- provides for the emotional and physical comfort and safety of patients;
- observes, records and reports to the appropriate persons;
- performs specialized nursing functions;
- assists with rehabilitation of patients, according to the patient care plan.

The second function explained in the Statement is patient care management. By role and functions, the LPN is qualified to work competently with long-term care patients.

Figure [illegible] The major activity of the LPN is direct patient care.

5088

EXPERIENCE

Figure 1-5. A significant number of LPNs are working in nursing homes, extended care, and related facilities.

The 1969 Facts About Nursing reports:

(1) LPNs in Nongovernmental Nursing Homes & Related Facilities

(April 1968)

23,532 full-time 11,291 part-time

(2) Nonsupervisory RNs in Nongovernmental Nursing Homes & Related Facilities

(April 1968)

13,123 full-time 14,949 part-time

5089

The hospital is the largest employer of LPNs; approximately two-thirds of all employed LPNs work in hospitals. Some 14% of employed LPNs are private duty nurses; 13% of employed LPNs work in nursing homes and related facilities. This last figure compares with some 4% staff or general duty RNs. Only 2% of all employed staff or general duty RNs are full-time employees in nursing homes and related facilities; 9% LPNs are full-time.

A significant number of licensed practical nurses are working in nursing homes, extended care, and related facilities, and the number is increasing annually.

STUDY ACTIVITIES

NURSING

1. What is nursing? Write your own definition of nursing.

2. Who is a nurse? Describe yourself as a nurse.

5091

3. What do nurses do? Describe the general functions of nurses. What do you do as a nurse?

4. Read the following 1887 job description of a bedside nurse. Compare the description with the general functions of nurses today.

1887 Job Description

In addition to caring for your 50 patients, each bedside nurse will follow these regulations: 1. Daily sweep and mop the floors of your ward, dust the patient's furniture and window sills. 2. Maintain an even temperature in your ward by bringing in a scuttle of coal for the day's business. 3. Light is important to observe the patient's condition. Therefore, each day fill kerosene lamps, clean chimneys, and trim wicks. Wash the windows once a week. 4. The nurse's notes are important in aiding your physician's work. Make your pens carefully, you may whittle nibs to your individual taste. 5. Each nurse on day duty will report every day at 7 A.M. and leave at 8 P.M., except on the Sabbath on which day she will be off from 12 noon to 2 P.M. 6. Graduate nurses in good standing with the director of nurses will be given an evening off each week for courting purposes, or two evenings a week if you go regularly to church. 7. Each nurse should lay aside from each pay day a goodly sum of her earnings for her benefits during her declining years, so that she will not become a burden. For example, if you earn $30 a month you should set aside $15. 8. Any nurse who smokes, uses liquor in any form, gets her hair done at a beauty shop or frequents dance halls will give the director of nurses good reason to suspect her worth, intentions and integrity. 9. The nurse who performs her labors, serves her patients and doctors faithfully and without fault for a period of five years will be given an increase by the hospital administration of five cents a day.

(From "Bright Corridors," a publication of Cleveland Lutheran Hospital)

5093

FUNCTIONS AND QUALIFICATIONS OF THE LPN

1. What is the general value of a Statement of Functions and Qualifications of the Licensed Practical Nurse?

2. "The work of the licensed practical nurse is an integral part of nursing." What does this mean? Why is it important?

3. Describe the range of nursing activities of licensed practical nurses.

4. In a complex nursing situation, the LPN may work closely with an autonomous health professional. In these situations, how are the capabilities of the LPN determined?

5095

5. How did you become an LPN? (If you completed a formal education program in practical nursing, describe the program briefly.)

6. What additional learnings have you acquired through (a) orientation to the job, (b) inservice programs, and (c) continuing education?

7. In what State (s) do you hold a current license?

8. What legal responsibilities do you have as an LPN?

9. The LPN "recognizes and has a commitment to meet the ethical, moral and legal obligations of the practice of practical nursing." What does this mean? Why is it important?

10. The LPN "maintains and promotes good health practices." What does this mean? Why is it important?

11. The LPN "actively promotes and participates in nursing organizations, inservice education programs, workshops, institutes and other educational and community activities." What does this mean? Why is it important?

12. Describe a patient situation in which the major function of the LPN is direct patient care.

13. Describe a patient situation in which the major function of the LPN is patient care management.

14. Describe a patient situation in which the major function of the LPN is community health.

15. What special functions does the LPN citizen have in the community?

5100

16. Describe a "typical" tour of duty for yourself.

17. Using the functions described in the Statement, compare and contrast your "functions" with stated functions.

0012

5101

THE LPN AND LONG-TERM CARE

1. Support or document the statement: licensed practical nurses are prepared to nurse patients effectively in nursing homes, extended care, and related facilities.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

Chapter 2

MEDICARE AND MEDICAID

In 1965 Congress added to the Social Security program begun in 1935 two significant amendments on health care and services. One, Title XVIII, established MEDICARE - a Federal program of hospital and medical insurance for nearly all people 65 and over. The other, Title XIX, established MEDICAID - a Federal-State program to help provide medical services for the needy and the medically indigent.

The following remarks were made by President Johnson upon signing the Social Security Amendments of 1965 in Independence, Missouri, July 30, 1965:

> It was a generation ago that Harry Truman said, "Millions of our citizens do not now have a full measure of opportunity to achieve and to enjoy good health. Millions do not now have protection or security against the economic effects of sickness. And the time has now arrived for action to help them attain that opportunity and to help them get that protection.
>
> . . . today, . . . we are taking such action 20 years later. . . . The need for this action is plain . . .
>
> There are more than 18 million Americans over the age of 65. Most of them are threatened by illness and medical expenses that they cannot afford . . .
>
> This insurance will help pay for care in hospitals, in skilled nursing homes, or in the home. And under a separate plan it will meet the fees of the doctors . . .
>
> No longer will older Americans be denied the healing miracle of modern medicine. No longer will illness crush and destroy the savings that they have so carefully put away over a lifetime so that they might enjoy dignity in their later years. No longer will young families see their own incomes, and their own hopes eaten away simply because they are carrying out their deep moral obligations to their parents, and to their uncles, and their aunts.

In the Federal Government both programs are administered by the Department of Health, Education, and Welfare. The Social Security Administration directs Medicare; Social and Rehabilitation Service directs Medicaid.

Both Medicare and Medicaid help pay medical bills. Both are part of the Social Security act. They work together but they are not the same.

2105

5103

5104

Figure 2-1. MEDICARE - a Federal program of hospital and medical insurance for nearly all people 65 and over.

DO NOT FILM THIS PAGE

DO NOT FILM THIS PAGE

Figure 2-2. MEDICAID - a Federal-State assistance program to help provide medical services for needy and low-income people.

Both Medicare and Medicaid insist on high standards, support expansion of facilities, encourage innovation in medical care delivery and require review of care. Medicaid requires that medical services be available everywhere in a State. It is also beginning a program to train and employ neighborhood people as community health workers.

Together Medicare and Medicaid are significant programs striving to benefit everybody by improving the quality, the quantity, the efficiency, the distribution, and the effectiveness of medical services in the United States.

Both Medicare and Medicaid must be operated in compliance with Title VI of the Civil Rights Act of 1964 which prohibits discrimination:

> No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefit of, or be subjected to discrimination under any program or activity receiving Federal financial assistance.

The following comparison may help you identify similarities and differences between the two programs:

	MEDICARE	MEDICAID
(1)	- is for people 65 or older. - almost everybody 65 or older rich or poor can have Medicare. - some people 65 or older can have both Medicare and Medicaid.	- is for <u>certain kinds</u> of needy and low-income people: .. the aged .. the blind .. the disabled .. members of families with dependent children .. some other children. - some States also include (at State expense (other needy and low-income people.
(2)	- is an <u>insurance</u> program. - money from trust funds pays medical bills for <u>insured</u> people.	- is an <u>assistance</u> program. - money from Federal, State, and local taxes pays medical bills for <u>eligible</u> people.
(3)	- is a <u>Federal</u> program. - Medicare is the same all over the United States.	- is a <u>Federal-State</u> partnership. - States design their own Medicaid programs with Federal guidelines. - Medicaid varies from State to State.
(4)	- Medicare is everywhere in the United States.	- Medicaid will probably be everywhere in the United States by 1970. - Medicaid is now in most States, the District of Columbia, Guam, Puerto Rico, and the Virgin Islands.

	MEDICARE	MEDICAID
(5)	- Medicare Hospital Insurance provides basic protection against costs of .. inpatient hospital care .. post-hospital extended care .. post-hospital home health care.	- Medicaid pays for at least these five services: .. inpatient hospital care .. outpatient hospital services .. other laboratory and X-ray services .. skilled nursing home services .. physicians' services.
	- Medicare Medical Insurance provides supplemental protection against costs of physicians' services, medical services and supplies, home health care services, outpatient hospital services and therapy, and other services.	- in many States Medicaid pays for such additional services as dental care, prescribed drugs, home health care, eye glasses, clinic services, and other diagnostic, screening, preventive, and rehabilitative services.
(6)	- Medicare pays most but not all hospital and medical costs for people who are insured.	- Medicaid can pay what Medicare does not pay for people who are eligible for both programs.
	- Hospital Insurance pays inpatient hospital bills except for the first $52 in benefit period.	- Medicaid can pay the $52 Medicare does not pay in each benefit period for eligible people.
	- Medical Insurance pays $4 out of $5 (80%) of reasonable medical costs <u>except</u> for the first $50 in each calendar year.	- Medicaid can pay the first $50 per year of medical care costs and can pay what Medicare does not pay of the remaining reasonable charges for eligible people.
	- insured people pay $5.80 a month for Medical Insurance (rates differ slightly depending on time of enrollment; premium rates are reviewed annually).	- Medicaid can pay the $5.80 a month for eligible people.
(7)	- Medicare Hospital Insurance is financed by a separate payroll contribution.	- Medicaid is financed by Federal and State governments.
	- Medicare Medical Insurance is financed by monthly premiums. The Federal Government pays half and the insured person pays half.	- The Federal Government contributes from 50% (to the richest States) to 83% (to the State with the lowest per-capita income) of medical care costs for needy and low-income people who are aged, blind, disabled, or members of families with dependent children.
		- States pay the remainder, usually with help from local governments.

STUDY ACTIVITIES

The Senior Citizens Club of Jeffersonville has invited several health practitioners to participate in a panel discussion of Medicare: Dr. Joseph McCartney, a local physician; Mrs. Ruth Ziegler, RN, Director of Nursing at Lake Valley Memorial Hospital; Mrs. Ida Mae Washington, LPN Charge Nurse, and Miss Ellen Higgins, LPN Charge Nurse at Elk Manor Nursing Home and Extended Care Facility.

Mrs. Ziegler described the Hospital Insurance part of Medicare briefly:

> Your hospital insurance helps pay for medically necessary services provided by health facilities participating in Medicare when you are a bed patient in a hospital. And if you need further care after a hospital stay, payments are made when you are a bed patient in an extended care facility or a patient at home receiving services from a home health agency. The services hospital insurance helps pay for are called covered services. Your hospital insurance covers almost all of the services you would ordinarily receive as a bed patient in a participating hospital or extended care facility or as a patient at home receiving services from a participating home health agency. Your hospital insurance will also, in some cases, help pay for care in certain hospitals that do not participate in Medicare. When you receive covered services from a participating hospital, extended care facility, or home health agency, you do not need to make any claim for your hospital insurance benefits. These institutions or agencies make the claims and receive the Medicare payment. They have agreed to charge you only for services which are not covered by Medicare. You will always receive a notice from the Social Security Administration when a payment has been made on your behalf.

The men and women senior citizens asked the following general questions of the panel; try to answer them in an accurate, explanatory way.

1. How is the hospital insurance part of Medicare financed?

2. How often can I use my hospital insurance?

3. Can I renew my hospital insurance?

4. How do I keep a record of how much insurance, how many "days" or "visits" I have used?

5. What does hospital insurance pay for when I am a hospital bed patient?

6. How does a person get admitted to an extended care facility?

7. What benefits am I entitled to in an extended care facility?

8. How does a person qualify for home health benefits?

9. What home health benefits can a Medicare patient receive?

Dr. McCartney described the Medical Insurance part of Medicare briefly:

> Your medical insurance helps pay for doctors' services, outpatient hospital services, medical services and supplies, home health services, outpatient physical therapy, and other health care services. The kinds of services medical insurance can help pay for are called covered services. For each calendar year, medical insurance does not pay any of the first $50 of reasonable charges for covered services. Reasonable charges are determined by the Medicare carriers - the organizations selected in each State by the Social Security Administration to handle medical insurance claims - and take into account the customary charges of your doctor as well as the charges made by other doctors in your locality for similar services. After Medicare records show that your bills for covered services are over $50 for a calendar year, medical insurance will pay 80% of the reasonable charges for covered services for the rest of the year. (There are a few exceptions to this rule.) Be sure to send in a claim as soon as your bills reach $50 so the Medicare records will show the first $50 as well as the rest of your bills.

The group asked the following questions of the panel about Medical Insurance; try to answer them in an accurate, explanatory way.

1. What are some of the doctor bills medical insurance helps pay?

2. What kinds of dental services will medical insurance cover?

3. When I am a patient in a hospital, what kinds of laboratory and X-ray services are paid for by medical insurance?

4. Will medical insurance pay for ambulance services?

5. What kinds of outpatient hospital services does medical insurance help pay for?

6. Would you explain the home health benefits that are covered by medical insurance?

7. What are some of the different medical services and supplies that are paid for by medical insurance?

5116

8. How does a person make a claim for medical insurance?

The local district of the State Association of Licensed Practical Nurses has invited a representative of the State office of Social and Rehabilitation Service to discuss the Medical Assistance (Medicaid) Program. Try to find answers to some of the following general questions.

1. Just what is Medical Assistance (Medicaid)?

2. Who administers the Medicaid program?

3. What kinds of people in this State can benefit from the Medicaid Program?

4. Who is eligible for Medicaid?

5. What kinds of medical care and services are covered by the Medicaid Program?

6. How do hospitals and nursing homes meet institutional requirements to participate in Medicaid?

7. How is payment for Medicaid care and services handled?

8. Are any social services available under Medicaid?

9. Can a person qualify for both Medicare and Medicaid? Please explain.

Chapter 3

PATIENTS ARE PEOPLE

It is important to remind yourself again and again that patients are people. Each patient is a multi-dimensional person. At the same time he or she may be a worker, a mate, a parent, a homemaker; your patient may be a son or daughter, citizen, friend, organization member, religious affiliate, and user of leisure time.

Your patients require skilled long-term care because of chronic disease or disabilities, or because of dependencies associated with aging. We all have different concepts of health, illness, life and death, and each patient's reaction to illness and his subsequent need for care is conditioned greatly by his individual and cultural perceptions of life and death.

Many patients requiring long-term care experience intense feelings of guilt and disappointment. "How can my family afford to keep me in this nursing home; it would be better if I died." "What good am I to my wife and boys; I am only half a man, I have no legs." Occasionally patients obtain secondary gains, such as absence from work, because of a long-term illness.

Patients are people - very special, complex people.

OLDER PEOPLE

Many of your patients are older adults and you already know a great deal about older people and their characteristics. The following review may prove helpful.

PHYSICAL CHARACTERISTICS

- loses speed and flexibility in movement
- performs simple, repetitive tasks best
- more susceptible to respiratory infections
- circulatory diseases more common
- less able to maintain normal body temperature
- sensory processes decline
- male sex drive decreases
- hypertrophy of prostate gland

MENTAL CHARACTERISTICS

- poorer short-term memory
- rate of learning declines but not necessarily the capacity to learn

EMOTIONAL CHARACTERISTICS

- possibility of shelved obsolescence or life of esteem and achievement
- timid, uncertain, easily discouraged, sensitive, suspicious
- kind, gracious, gentle, loving, wise, and possesses the inner security and peace which youth cannot achieve

5122

Despite these many physical impairments and the fact that at times the older adult may be confused, he is still capable and able to assist with his personal care and with many of the activities of daily living.

Institutionalization may be a new and strange experience for the older adult and he may be afraid. Institutionalization for many adults is not voluntary. If the older adult can help make plans for his health care he seems to adjust to the situation better.

CHILDREN AND ADULTS WITH CHRONIC CONDITIONS

Today a great number of children, youth and young adults have chronic diseases and disabilities and need long-term care. Deaths from communicable disease are fewer in the United States than 60 years ago. Improved diagnostic practice makes it possible to identify and detect chronic disease (pathological processes) in children, youth, and adults earlier than in former years.

Many long-term care patients are accident victims. Accidents are a leading cause of disability in the United States among children and young adults. Thousands of disabled veterans from former and present wards need skilled long-term care and rehabilitation.

Heart disease and cancer affect people throughout the age span and cause many chronic conditions and disabilities.

For these reasons the number of persons with chronic disabilities is increasing. However, new treatment modalities, progressive health legislation, and a concern on the part of the health profession for long-term care patients makes rehabilitation a possibility and reality for many persons with chronic conditions.

STUDY ACTIVITIES

1. Please ask and answer the question "who am I?" twenty times.

3. Each patient is a multi-dimensional person. What does this mean?

4. Describe a "typical" older adult. Mention physical, mental, emotional, social, and spiritual characteristics.

5. Why is aging so often associated with illness?

6. Explain the following statement: The older adult is a difficult patient; the older adult is a challenging patient.

7. Why does an <u>increasing</u> number of children, youth and young adults need long-term care?

Chapter 4

SETTINGS FOR LONG-TERM CARE

"The right person, in the right place, at the right time, with the right service, at the right cost," is basic to the concept of progressive patient care and the idea of comprehensive health planning. Patients who require skilled long-term care because of chronic disease or disabilities, or because of dependencies associated with aging receive care in a variety of settings: hospitals, extended care facilities, nursing homes, residential facilities, and at home.

The LPN charge nurse may function in several different institutional settings: hospitals, extended care facilities, intermediate care facilities, and nursing homes.

HOSPITALS

The daily census of most general hospitals reveals a large number of medical (long-term) patients as well as a significant number of patients over the age of 65. Today hospitals participate and provide services in the Health Insurance for the Aged Program (Medicare) and the Medical Assistance Program (Medicaid). Conditions of Participation have been established and procedures to determine eligibility stated. Specific conditions of participation have been developed for the following hospital functions and situations:

- Compliance with State and Local Laws
- Governing Body
- Physical Environment
- Medical Staff
- Nursing Department
- Dietary Department
- Medical Record Department
- Pharmacy or Drug Room
- Laboratories
- Radiology Department
- Medical Library
- Complementary Departments
- Outpatient Department
- Emergency Service or Department
- Social Work Department
- Utilization Review Plan

The conditions of participation for the nursing department are included for study. Because so many nursing responsibilities entail cooperation and collaboration with other hospital departments, it is suggested that the LPN obtain and read the entire Conditions of Participation; Hospitals.

405.1024 Condition of Participation - Nursing Department
The hospital has an organized nursing department. A licensed registered professional nurse is on duty at all times and professional nursing service is available for all patients at all times.

(a) Standard; Organization. - There is a well-organized departmental plan of administrative authority with delineation of responsibilities and duties of each category of nursing personnel. The factor explaining the standard is as follows: The delineation of responsibilities and duties for each category of the nursing staff may be in the form of a written job description for each category.

(b) Standard; Licensed Registered Professional Nurse. - There is an adequate number of licensed registered professional nurses to meet the following minimum staff requirements: Director of the department; Assistants to the director for evening and night services; Supervisory and staff personnel for each department or nursing unit to insure the immediate availability of a registered professional nurse for bedside care of any patient when needed; and registered professional nurse on duty at all times and available for all patients on a 24-hour basis. The factors explaining the standard are as follows: (1) The staffing pattern insures the availability of registered professional nursing care for all patients on a 24-hour basis every day. (2) If a licensed practical nurse or nursing aide is on duty during the evening andnight hours in a ward with patients who do not generally need skilled nursing care, there is a registered professional nurse supervisor who makes frequent rounds and is immediately available to give skilled nursing care when needed. She is free to render bedside care and is not occupied in the operating room, delivery room, or emergency room for long periods of time. (3) The ratio of registered professional nurses to patients together with the ratio of registered professional nurses to other nursing personnel is adequate to provide proper supervision of patient care and staff performance, taking into consideration the characteristics of the patient load. (4) A registered professional nurse assigns the nursing care of each patient to other nursing personnel in accordance with the patient's needs and the preparation and competence of the nursing staff available.

(c) Standard; Other Nursing Personnel. - There are other nursing personnel in sufficient numbers to provide nursing care not requiring the service of a registered professional nurse. The training and supervision of these personnel are continually planned and carried out to enable them to perform effectively the duties which are assigned to them.

(d) Standard; Non-floor Services. - There are adequate nursing personnel for the surgical suite, clinics, and other services of the hospital in keeping with their size and degree of activity. The factors explaining the standard are as follows: (1) A registered professional nurse is in charge of the operating rooms. (2) Surgical technicians and licensed practical nurses may be permitted to serve as "scrub nurses" under the direct supervision of a registered professional nurse; they are not permitted to function as circulating nurses in the operating rooms.

(e) Standard; Qualifications. - Individuals selected for the nursing staff are qualified by education, experience, and demonstrated ability for the positions to which they are appointed. The factors explaining the standard are as follows: (1) The director of nursing makes decisions relative to the selection and promotion of nursing personnel based on their qualifications and capabilities and recommends the termination of employment when this is necessary. (2) The educational and experiental qualifications of the director of nursing, her assistants, and supervisors are commensurate with the size and complexity of the hospital. (3) The functions and qualifications of nursing personnel are clearly defined in relation to the duties and responsibilities delegated to them. (4) There is a procedure to insure that hospital nursing personnel, for whom licensure is required, do have valid and current licensure. (5) Personnel records including application forms and verification of credentials are on file. (6) New employees are oriented to the hospital nursing service, and their jobs.

(f) Standard; Working Relationships. - There are well established working relationships with other services of the hospital, both administrative and professional. The factors explaining the standard are as follows: (1) Registered professional nurses confer with the physicians relative to patient care. (2) Interdepartmental policies affecting nursing service and nursing care to patients are made jointly with the director of nursing. (3) There are established procedures for scheduling laboratory and X-ray examinations, for ordering, securing, and maintaining supplies and equipment needed for patient care, for ordering diets, etc.

(g) Standard; Evaluation and Review of Nursing Care. - There is constant review and evaluation of the nursing care provided for patients and there are written nursing care procedures and written nursing care plans for patients. The factors explaining the standard are as follows: (1) Nursing care policies and procedures are written and consistent with generally accepted practice and are reviewed and revised as necessary to keep pace with best practice and new knowledge. (2) A registered professional nurse plans, supervises, and evaluates the nursing care for each patient. (3) Nursing care plans are kept current daily. Plans indicate nursing care needed, how it is to be

accomplished, and methods, and approaches and modifications necessary to insure best results for the patient. (4) Nursing notes are informative and descriptive of the nursing care given and include information and observations of significance so that they contribute to the continuity of patient care. (5) Only (i) a licensed physician or a registered professional nurse or (ii) a licensed practical nurse, a student nurse in an approved school of nursing, or a psychiatric technician, when these classes of personnel are under the direct supervision of a registered professional nurse, is permitted to administer medications, and in all instances, in accordance with the Nurse Practice Act of the State. (6) All medical orders are in writing and signed by the physician. Telephone orders are used sparingly, are given only to the registered professional nurse, and are signed or initialed by the physician as soon as possible. (7) Blood transfusions and intravenous medications are administered in accordance with State law. If administered by registered professional nurses, they are administered only by those who have been specially trained for this duty. (8) There is an effective hospital procedure for reporting transfusion reactions and adverse drug reactions.

(h) Standard; Staff Meetings. - Meetings of the registered professional nursing staff are held at least monthly to discuss patient care, nursing service problems, and administrative policies. The pattern for meetings may be by clinical departments, by categories of the staff, or by the staff as a whole. Minutes of all meetings are kept. The factors explaining the standard are as follows: (1) Minutes reflect the purpose of the staff meetings; e.g., review and evaluation of nursing care, ways of improving nursing service, discussion of nursing care plans for individual patients, consideration of specific nursing techniques and procedures, establishment and/or interpretation of nursing department policies, interpretation of administrative and medical staff policies, reports of meetings, etc. (2) Minutes are available to staff members either individually or are maintained in a central place.

EXTENDED CARE FACILITIES

Sometimes a patient no longer needs the intensive care which hospitals provide, but still needs full-time skilled nursing care and other health services which cannot be furnished in his home. In these cases, the doctor may transfer the patient from the hospital to an extended care facility. This is a specially qualified facility which is staffed and equipped to furnish full-time skilled nursing care and many important related health services. An extended care facility may be an institution or a distinct part of an institution which qualifies to participate in the health insurance program for the aged. All extended care facilities must have transfer agreements with one or more hospitals.

The extended care benefit provided by the health insurance program for the aged is intended to be a benefit for those persons who, though they no longer require the level of intensive care ordinarily furnished in a general hospital, continue to need for medical reasons a level of care entailing medically supervised skilled nursing and related services

on a continuing basis in an institutional setting. The extended care benefit covers not only postacute hospitalization where the individual is convalescing or being rehabilitated but also those types of cases where the patient may continue to be severely ill and indeed have little or no prospect of recovery. A physician certifies that the extended care facility services are required because the patient needs "skilled nursing care on a continuing basis" for any of the conditions for which he had just been previously hospitalized. Thus, a terminal cancer patient who may receive only palliative treatment but whose condition requires skilled nursing services available at all times would qualify for extended care benefits. The underlying purpose of the extended care benefit is to encourage the most effective and economical utilization of available medical care resources and facilities. Since it will be necessary for many aged patients who are hospitalized for intensive treatment of an acute phase of illness to undergo a period of medically supervised convalescence or care in a facility which is staffed and equipped to provide skilled nursing and other restorative services, the extended care benefit was provided to enable physicians to transfer patients to such facilities rather than allowing patients to continue unnecessarily to occupy high-cost hospital beds.

Accordingly, an extended care facility, whether it is a distinct part of an institution or a separate institution, is a facility which provides a level of care distinguishable from the level of intensive care ordinarily furnished by a general hospital. This level of care is reflected in the conditions of participation. While the conditions call for a wide range of specialized medical services and the employment by the facility in adequate numbers of a variety of paramedical and skilled nursing personnel, the emphasis is on the provision of skilled nursing and related care rather than the type of care and treatment required in the acute phase of an illness. Similarly, although the legislative language concerning rehabilitation services is the same with respect to hospitals and extended care facilities, the general concept of an extended care facility is that of an intermediate institution which provides post-hospital, subacute services. Hence, a rehabilitation hospital would be equipped and staffed to diagnose and evaluate the patient's disability and to initiate a rehabilitation regime. A rehabilitation extended care facility, on the other hand, would be staffed and equipped to continue and modify such a regime during the patient's convalescence.

In general, a hospital is designed to initiate care, including diagnosis and treatment. The extended care facility is designed to continue care, with appropriate modifications as the patient's condition changes.

Specific conditions of participation have been developed for the following extended care facility functions and situations:

- Compliance with State and Local Laws
- Administrative Management
- Patient Care Policies
- Physician Services
- Nursing Services
- Dietary Services
- Restorative Services

- Pharmaceutical Services
- Diagnostic Services
- Dental Services
- Social Services
- Patient Activities
- Clinical Records
- Transfer Agreement
- Physical Environment
- Housekeeping Services
- Disaster Plan
- Utilization Review Plan

The following overview explains these conditions of participation in a little more detail. An extended care facility is engaged primarily in providing to inpatients (1) skilled nursing care and related services for patients who require medical or nursing care, or (2) rehabilitation services for the rehabilitation of injured, disabled, or sick persons. The facility must have policies which are developed and reviewed by a group of professional personnel, including one or more physicians and one or more registered professional nurses; policies relate to skilled nursing care and other medical services provided by the facility. An extended care facility or ECF, must have a physician, a registered professional nurse, or a medical staff responsible for the execution of such policies. The health care of every patient must be under the supervision of a physician and a physician must be available to furnish necessary medical care in case of an emergency. An ECF must maintain clinical records on all patients.

An extended care facility must provide 24-hour nursing service which is sufficient to meet nursing needs in accordance with the policies developed; at least one registered professional nurse must be employed full time. The ECF must provide appropriate methods and procedures for the dispensing and administering of drugs and biologicals. It must have in effect a utilization review plan. Other conditions relating to the health and safety of patients who receive services in an extended care facility may be required by State, local, and Federal officials as deemed necessary.

The conditions of participation - nursing services are included for study. Because so many charge nurse responsibilities require cooperation and collaboration with all departments, it is suggested that the LPN obtain and read the entire booklet Conditions of Participation; Extended Care Facilities.

> 405.1124 Condition of Participation - Nursing Services. - The extended care facility provides 24-hour nursing service which is sufficient to meet the nursing needs of all patients. There is at least one registered professional nurse employed full time and responsible for the total nursing service. There is a registered professional nurse or licensed practical nurse who is a graduate of a State approved school of practical nursing in charge of nursing activities during each tour of duty. The terms "licensed practical nurse (s)" and "practical nursing" as used in this section are synonymous with "licensed vocational nurse (s)" and "vocational nursing."

Figure 4-2. Patient care in an extended care facility.

(a) Standard; Full-time Nurse. - There is at least one registered professional nurse employed full time. If there is only one registered professional nurse, she serves as director of the nursing service, works full time during the day, and devotes full time to the nursing service of the facility. If the director of nursing has administrative responsibility for the facility, she has a professional nurse assistant so that there is the equivalent of a full-time director of nursing service. The director of nursing service is trained or experienced in areas such as nursing service administration, rehabilitation nursing, psychiatric or geriatric nursing.

(b) Standard; Director of Nursing Service. - The director of the nursing service is responsible for: (1) Developing and/or maintaining nursing service objectives, standards or nursing practice, nursing procedure manuals, and written job descriptions for each level of nursing personnel; (2) Recommending to the administrator the number and levels of nursing personnel to be employed, participating in their recruitment and selection,

and recommending termination of employment when necessary; (3) Assigning and supervising all levels of nursing personnel; (4) Participating in planning and budgeting for nursing care; (5) Participating in the development and implementation of patient care policies and bringing patient care problems requiring changes in policy to the attention of the professional policy advisory groups; (6) Coordinating nursing services with other patient care services such as physician, physical therapy, occupational therapy, and dietary; (7) Planning and conducting orientation programs for new nursing personnel, and continuing inservice education for all nursing personnel; (8) Participating in the selection of prospective patients in terms of nursing services they need and nursing competencies available; (9) Assuring that a nursing care plan is established for each patient and that his plan is reviewed and modified as necessary.

(c) Standard; Supervising Nurse. - Nursing care is provided by or under the supervision of a full-time registered professional nurse currently licensed to practice in the State. The factors explaining the standard are as follows: (1) The supervising nurse is trained or experienced in areas such as nursing administration and supervision, rehabilitation nursing, psychiatric or geriatric nursing. (2) The supervising nurse makes daily rounds to all nursing units performing such functions as visiting each patient, reviewing clinical records, medication cards, patient care plans and staff assignments, and to the greatest degree possible accompanying physicians when visiting patients.

(d) Standard; Charge Nurse. - There is at least one registered professional nurse or qualified licensed practical nurse who is a graduate of a State approved school of practical nursing on duty at all times and in charge of the nursing activities during each tour of duty. The factors explaining the standard are as follows: (1) A State-approved school of practical nursing is one whose standards of education meet those set by the appropriate State nurse licensing authority. (2) Some State laws laws grant practical nurse licensure (nonwaivered) to certain individuals who have an educational background considered to be equivalent to graduation from a State-approved school of practical nursing. Such licensure determination is made by the appropriate State nurse licensing authority on the basis of evaluation of the individual's educational achievements, as well as on successful completion of the appropriate State licensing examination. Licensure under such conditions may be accepted as meeting the requirement of graduation from a State-approved school of practical nursing. (3) It is desirable that the nurse in charge of each tour of duty be trained or experienced in areas such as nursing administration and supervision, rehabilitation nursing, psychiatric or geriatric nursing. (4) The charge nurse has the ability to recognize significant changes in the condition of patients and to take necessary action. (5) The charge nurse is responsible for the total nursing care of patients during her tour of duty.

(e) Standard; 24-hour Nursing Service. - There is 24-hour nursing service with a sufficient number of nursing personnel on duty at all times to meet the total needs of patients. The factors explaining the standard are as follows: (1) Nursing personnel include registered professional nurses, licensed practical nurses, aides and orderlies. (2) The amount of nursing time available for patient care is exclusive of nonnursing duties. (3) Sufficient nursing time is available to assure that each patient: (i) Receives treatments, medications and diet as prescribed; (ii) Receives proper care to prevent decubiti and is kept comfortable, clean, and well-groomed; (iii) Is protected from accident and injury by the adoption of indicated safety measures; (iv) Is treated with kindness and respect. (4) Licensed practical nurses, nurses' aides and orderlies are assigned duties consistent with their training and experience.

(f) Standard; Restorative Nursing Care. - There is an active program of restorative nursing care directed toward assisting each patient to achieve and maintain his highest level of self care and independence The factors explaining the standard are as follows: (1) Restorative nursing care initiated in the hospital is continued immediately upon admission to the extended care facility. (2) Nursing personnel are taught restorative nursing measures and practice them in their daily care of patients. These measures include: (i) Maintaining good body alignment and proper positioning of bedfast patients; (ii) Encouraging and assisting bedfast patients to change positions at least every 2 hours day and night to stimulate circulation, and prevent decubiti and deformities; (iii) Making every effort to keep patients active and out of bed for reasonable periods of time, except when contraindicated by physicians' orders, and encouraging patients to achieve independence in activities of daily living by teaching self care, transfer and ambulation activities; (iv) Assisting patients to adjust to their disabilities, to use their prosthetic devices, and to redirect their interests if necessary; (v) Assisting patients to carry out prescribed physical therapy exercises between visits of the physical therapist. (3) Consultation and instruction in restorative nursing available from State or local agencies are utilized.

(g) Standard; Dietary Supervision. - Nursing personnel are aware of the dietary needs and food and fluid intake of patients. The factors explaining the standard are as follows: (1) Nursing personnel observe that patients are served diets as prescribed. (2) Patients needing help in eating are assigned promptly upon receipt of meals. (3) Adaptive self-help devices are provided to contribute to the patient's independence in eating. (4) Food and fluid intake of patients is observed and deviations from normal are reported to the charge nurse. Persistent unresolved problems are reported to the physician.

(h) Standard; Nursing Care Plan. - There is a written nursing care plan for each patient based on the nature of illness, treatment prescribed, long- and short-term goals and other pertinent information. The factors explaining the standard are as follows: (1) The nursing care plan is a personalized daily plan for individual patients. It indicates what nursing care is needed, how it can best be accomplished for each patient, how the patient likes things done, what methods and approaches are most successful, and what modifications are necessary to insure best results. (2) Nursing care plans are available for use by all nursing personnel. (3) Nursing care plans are reviewed and revised as needed. (4) Relevant nursing information from the nursing care plan is included with other medical information when patients are transferred.

(i) Standard; Inservice Education Program. - There is a continuing inservice educational program in effect for all nursing personnel in addition to a thorough job orientation for new personnel. Skill training for nonprofessional nursing personnel begins during the orientation period. The factors explaining the standard are as follows: (1) Planned inservice programs are conducted at regular intervals for all nursing personnel. (2) All patient care personnel are instructed and supervised in the care of emotionally disturbed and confused patients, and are helped to understand the social aspects of patient care. (3) Skill training includes demonstration, practice, and supervision of simple nursing procedures applicable in the individual facility. It also includes simple restorative nursing procedures. (4) Orientation of new personnel includes a review of the procedures to be followed in emergencies. (5) Opportunities are provided for nursing personnel to attend training courses in restorative nursing and other educational programs related to the care of long-term patients.

INTERMEDIATE CARE FACILITIES

Many people, because of their physical or mental limitations or both, require living accommodations and care, which as a practical matter, can be made available to them only through institutional facilities. These people do not have an illness, disease, injury, or condition that requires the degree of care and treatment which a hospital or skilled nursing home provides. An intermediate care facility is an institution or a distinct part of an institution which is licensed under State law to provide its residents with such a defined range and level of care and services on a regular basis. Many State plans include benefits in the form of institutional services in intermediate care facilities.

The following pages describe the minimum range or level of care and services suitable to the needs of individuals in intermediate care facilities.

(i) Admission, transfer, and discharge of residents. The admission, transfer, and discharge of residents of the facility are conducted in accordance with written policies of the institution that include at least the following provisions. (a) Only those persons are accepted into the facility whose needs can be met within the accommodations and services the facility provides; (b) As changes occur in their physical or

mental condition, necessitating service or care not regularly provided by the facility, residents are transferred promptly to hospitals, skilled nursing homes, or other appropriate facilities; (c) The resident, his next of kin, and the responsible agency if any, are consulted in advance of the discharge of any resident, and casework services or other means are utilized to assure that adequate arrangements exist for meeting his needs through other resources.

(ii) Personal care and protective services. The types and amounts of protection and personal service needed by each resident of the facility are a matter of record and are known to all staff members having personal contact with the resident. At least the following services are provided. (a) There is, at all times, a responsible staff member actively on duty in the facility, and immediately accessible to all residents, to whom residents can report injuries, symptoms of illness, or emergencies, and who is immediately responsible for assuring that appropriate action is taken promptly. (b) Assistance is provided, as needed by individual residents, with routine activities of daily living including such services as help in bathing, dressing, grooming, and management of personal affairs such as shopping. (c) Continuous supervision is provided for residents whose mental condition is such that their personal safety requires such supervision.

(iii) Social services. Services to assist residents in dealing with social and related problems are available to all residents through one or more caseworkers on the staff of the facility; and/or, in the case of recipients of assistance, through caseworkers on the staff of the assistance agency; or through other arrangements.

(iv) Activities. Activities are regularly available for all residents, including social and recreational activities involving active participation by the residents, entertainment of appropriate frequency and character, and opportunities for participation in community activities as possible and appropriate.

(v) Food service. At least three meals a day, constituting a nutritionally adequate diet, are served in one or more dining areas separate from sleeping quarters, and tray service is provided for residents temporarily unable to leave their rooms.

(vi) Special diets. If the facility accepts or retains individuals in need of medically prescribed special diets, the menus for such diets are planned by a professionally qualified dietician, or are reviewed and approved by the attending physician, and the facility provides supervision of the preparation and serving of the meals and their acceptance by the resident.

Figure 4-3. Resident care in an intermediate care facility.

(vii) Health services. Whether provided by the facility or from other sources, at least the following services are available to all residents: (a) Immediate supervision of the facility's health services by a registered professional nurse or a licensed practical nurse employed full-time in the facility and on duty during the day shift. In some States there are two or more classifications of intermediate care facilities, and the employment of a nurse is not required of institutions in classifications serving only residents determined by their physicians not to need supervision by a licensed nurse. (b) Continuing supervision by a physician who sees the resident as needed and, in no case, less often than quarterly; (c) Under

direction by the resident's physician and general supervision by the nurse in charge of the facility's health services, guidance and assistance for each resident in carrying out his personal health program to assure that preventive measures, treatments, and medications prescribed by the physician are properly carried out and recorded; (d) Arrangements for services of a physician in the event of an emergency when the resident's own physician cannot be reached; (d) In the presence of minor illness and for temporary periods, bedside care under direction of the resident's physician including nursing service provided by, or supervised by, a registered professional nurse or a licensed practical nurse; (f) An individual health record for each resident including (1) the name, address, and telephone number of his physician; (2) a record of the physician's findings and recommendations in the pre-admission evaluation of the individual's condition and in subsequent reevaluations and all orders and recommendations of the physician for care of the resident; (3) all symptoms and other indications of illness or injury brought to the attention of the staff by the resident or from other sources, including the date, time, and action taken regarding each.

(viii) Living accommodations. Space and furnishings provide each resident clean, comfortable and reasonably private living accommodations with no more than four residents occupying a room, with individual storage facilities for clothing and personal articles, and with lounge, recreation and dining areas provided apart from sleeping quarters.

(ix) Administration and management. The direction and management of the facility are such as to assure that the services required by the residents are so organized and administered that they are, in fact, available to the residents on a regular basis and that this is accomplished efficiently and with consideration for the objective of providing necessary care within a homelike atmosphere. Staff are employed by the facility in sufficient number and competence, as determined by the appropriate State agency, to meet the requirements of the residents.

NURSING HOMES

Almost one million Americans are in 24,000 nursing homes. In recent years an increasing number of people have enterred the "nursing-home-business-for-profit." According to Florence McQuillan, nurse and authority on nursing home administration, a modern nursing home has the following objectives:

1. To provide continuing care for those recovering from surgical or medical disorders.

2. To assist patients in reaching optimal physical and emotional health.

3. To provide for the total needs of patients - physical, emotional, and spiritual.

4. To assist the aging toward an active participation in life.

5. To provide for rehabilitative services when the need exists.

6. To work cooperatively with other community and social agencies.

On the other hand, David Pryor, Congressman from Arkansas, believes a nursing home is "a halfway house somewhere between society and the cemetery." "American nursing homes for the elderly are divided into three general categories: expensive, bad, and terrible."

Who is correct? Perhaps both descriptions are accurate. We know that "less than good conditions" exist in many nursing homes. We know also that high quality care exists in many homes and can and will exist in even more. Most of our discussion will focus on nursing homes providing "skilled nursing care" as defined in the Medicaid provisions.

Just a word or so in general about nursing homes. A nursing home may be a private home, an institution, building, or residence which provides through its ownership or management maintenance, personal care, nursing, to three or more persons. Because of some illness or physical infirmity these people require such care. Nursing home management may be public (Federal, State, county, or community), religious, fraternal, charitable, non-profit, or private (individual or corporate) for profit. A "home for the aged" is similar, yet it provides sheltered care simply because people are older people and unable to maintain an independent way of life except for institutionalization.

States and most large cities have minimum standards, that is, rules and regulations for nursing homes. When a nursing home meets these standards, it is licensed. Standards relate to administration; general policies, medical supervision of patients; nursing; records; medications, treatments, narcotics and dangerous drugs; food service; plant maintenance, housekeeping, and sanitation; water supply and sewage disposal; furnishing, equipment, and supplies; buildings and grounds of the existing home; buildings and grounds of new construction or conversions; fire protection in the existing home; fire protection of new buildings and conversions; additions and alternations; building plans; as well as special standards for infants and children under 18 years of age.

To qualify as a skilled nursing home and receive Medicaid payments, an institution must supply the licensing agency of the State full and complete information as to the identity of each person having an ownership interest of 10% or more in the nursing home. If the nursing home is organized as a corporation or a partnership, officers, directors, and/or partners must be identified.

The nursing home must have and maintain an organized nursing service for its patients, which is under the direction of a professional registered nurse who is employed full-time by the home; other nursing and auxiliary personnel must be sufficient in number to provide adequate and properly supervised nursing services for all patients during all hours of each

Figure 4-4. Patient care in a nursing home.

day and all days of each week. There must be at least one professional registered nurse or licensed practical (or vocational) nurse on duty at all times and in charge of the nursing activities during each tour of duty. The LPN should be a graduate of a State-approved school of practical nursing or be a person who is found by the appropriate State licensing authority on the basis of the individual's education and formal training to have background considered to be equivalent to graduation from a State-approved school of practical nursing.

To qualify as a skilled nursing home, an institution must make satisfactory arrangements for professional planning and supervision of menus and meal service for patients for whom special diets or dietary restrictions are medically prescribed.

The nursing home must have satisfactory policies and procedures relating to the maintenance of medical records on each patient of the nursing home, dispensing and administering of drugs and biologicals, and assuring that each patient is under the care of a physician and that adequate provisions are made for medical attention to any patient during emergencies.

The nursing home must have arrangements with one or more general hospitals under which such hospital or hospitals will provide needed diagnostic and other services to patients of the nursing home. The hospitals agree to accept acutely ill patients from the nursing home who need hospital care.

The qualify as a skilled nursing home, institutions should meet the requisite provisions of the Life Safety Code of the National Fire Protection Association for nursing homes.

STUDY ACTIVITIES

"The right person, in the right place, at the right time, with the right service, at the right cost," is basic to the concept of progressive patient care and the idea of comprehensive health planning.

Complete the following chart by describing the kind of patient that should be in each of the following institutional settings: a hospital, an extended care facility, an intermediate care facility, and a nursing home. Identify major nursing needs of each patient and delineate the role of the LPN in meeting these needs.

When you have finished each chart, compare and contrast (1) patients, (2) patient nursing needs, and (3) the role of the LPN in meeting patient needs in the different institutional settings.

Part II

THE LICENSED PRACTICAL NURSE AS CHARGE NURSE

Chapter 5

INTRODUCTION

With the advent of Medicare and Medicaid, and the acknowledged shortage of prepared health practitioners in the areas of gerontology and long-term care, the LPN, because of her education, her role and functions, and her experience, emerged as one of the most qualified members of the health team to move into a leadership role in the management of skilled nursing care for patients in nursing homes, extended care and related facilities.

The government publications, Conditions of Participation; Hospitals and Conditions of Participation; Extended Care Facilities (Title XVIII - Medicare), as well as Institutional Services in Intermediate Care Facilities and Standards for Payment for Skilled Nursing Home Care (Title XIX - Medicaid) document well the need and the plan for utilization of the LPN in a patient management role.

> Hospitals: If a licensed practical nurse or nursing aid is on duty during the evening and night in a ward with patients who do not generally need skilled nursing care, there is a registered professional nurse supervisor who makes frequent rounds and is immediately available to give skilled nursing care when needed.
>
> Extended Care Facilities: There is at least one registered professional nurse or qualified licensed practical nurse . . . on duty at all times and in charge of the nursing activities during each tour of duty.
>
> Intermediate Care Facilities: Immediate supervision of the facility's health services is by a registered professional nurse or a licensed practical nurse employed full-time in the facility and on duty during the day shift.[1]
>
> Skilled Nursing Home: There must be at least one professional registered nurse or licensed practical (or vocational) nurse on duty at all times and in charge of the nursing activities during each tour of duty.

Consistent with national health needs and Federal legislation, is the Patient Care Management section of the revised Statement of Functions and Qualifications of the Licensed Practical Nurse.

> The licensed practical nurse, with additional preparation in specialized areas and under direction of autonomous health professionals is qualified to:

---

[1] In some States the employment of a nurse is not required if a physician determines the residents do not need supervision by a licensed nurse.

a. Supervise other nursing and health-related personnel.

b. Coordinate and make assignments of other nursing and health-related personnel and patients.

c. Serve as team leader.

d. Serve as charge nurse.

One of the first projects of the National Licensed Practical Nurses Educational Foundation, Inc. (the education and research arm of the National Federation of Licensed Practical Nurses) was the development of Guidelines for Continuing Education Programs for LPNs, and Criteria for Continuing Education of the LPN/LVN. The contract between the

Figure 5-1. The LPN charge nurse.

5154

Federation and the U. S. Public Health Service which resulted in the publication of this text is another example of LPN readiness and willingness to prepare for key nursing roles in patient care management.

The term charge nurse, as used in this text, means the immediate nursing supervisor, administrator or director of an individual unit or ward. In general, the charge nurse has a dual responsibility: (1) patient care, and (2) staff effectiveness.

The charge nurse is responsible for the nursing care of all patients on her unit for a specific tour of duty. This includes planning, implementation, and evaluation of the nursing care of all patients.

The charge nurse is responsible for staff effectiveness, because in large part, it is through her staff that she nurses her patients. Because she is in a leadership role, she is also responsible for guiding her staff toward personal and group satisfaction and achievement in their work.

Charge nurse functions vary from institution to institution, from unit to unit, and from shift to shift. In general, however, the following list of functions is characteristic and typical of the LPN charge nurse.

THE LICENSED PRACTICAL NURSE AS CHARGE NURSE

A Statement of Functions

The qualified licensed practical nurse who functions as charge nurse on certain tours of duty in nursing homes, extended care, and related facilities performs the following functions:

1. PLANS PATIENT CARE

   - demonstrates awareness of the comprehensive nature of long-term care
   - understands the condition, needs, and therapeutic goals of each patient
   - receives and interprets verbal and written reports about patient care
   - makes nursing rounds to observe and determine patient needs
   - assists the physician with examinations and treatments
   - discusses patient care goals with physician, nursing supervisor, and staff
   - develops nursing care plans for individual patients.

2. COORDINATES STAFF ACTIVITIES

   - exhibits an understanding of basic human behavior
   - demonstrates fundamental leadership techniques
   - uses management principles and procedures
   - communicates verbally and non-verbally: listens, speaks, reads, writes, gestures effectively
   - motivates staff to give skilled nursing care to all patients.

3. IMPLEMENTS PATIENT CARE

- develops plans to meet on-going needs of all patients
- develops plans for common types of emergency situations
- assigns personnel in terms of patient needs and staff proficiencies
- helps staff care for patients with special needs, the patient with mental illness, the dying patient
- coordinates work with that of other departments such as dietary, housekeeping, physical and occupational therapy, social service
- seeks guidance and assistance when problems are beyond scope
- prepared and gives verbal and written reports about patients: conferences, nurses' notes, tour of duty and special reports.

4. EVALUATES PATIENT CARE

- applies basic principles of evaluation
- makes nursing rounds to observe and assess patient care and needs
- assesses patient care plans and modifies as necessary
- assesses patient care given by staff and guides appropriate changes
- appraises self-performance and plans improvement.

5155

STUDY ACTIVITIES

1. Study the job description for charge nurse at your institution. Compare and contrast the description with The Licensed Practical Nurse as Charge Nurse: A Statement of Functions. What is similar? What is different?

   Similarities:

   Differences:

Chapter 6

PLANNING PATIENT CARE

The LPN charge nurse plans patient care for a specific tour of duty. To do this, she:

- demonstrates awareness of the comprehensive nature of long-term care
- understands the condition, needs, and therapeutic goals of each patient
- receives and interprets verbal and written reports about patient care
- makes nursing rounds to observe and determine patient needs
- assists the physician with examinations and treatments
- discusses patient care goals with physician, nursing supervisor, and staff
- develops nursing care plans for individual patients.

DEMONSTRATES AWARENESS OF THE COMPREHENSIVE NATURE OF LONG-TERM CARE

In the United States today, nursing homes, extended care, and related facilities assume a major responsibility for giving skilled long-term care. The nursing needs of your patients have many dimensions: physical, mental, emotional, social, and spiritual. It is necessary to meet these comprehensive patient needs on a planned, on-going basis over a long (extended) period of time, perhaps for the entire life of the person. It is equally important to encourage patient independence and prevent dependency.

UNDERSTANDS THE CONDITION, NEEDS, AND THERAPEUTIC GOALS OF EACH PATIENT

Patients are people ane each patient is an individual. A disease, disability, or dependency is specific for a person. All people have similar basic human needs. The degree of wellness or illness determines greatly how each need can be met and to what extent nursing is necessary to help the patient meet his needs. The physician works closely with the charge nurse and other members of the health team to establish a therapeutic goal for each patient and plan care. A goal may be curative, rehabilitative, or palliative.

RECEIVES AND INTERPRETS VERBAL AND WRITTEN REPORTS ABOUT PATIENT CARE

Verbal and written reports about patients between personnel on different tours of duty promote continuity of patient care. The charge nurse obtains a complete report on the condition of each patient from the nurse she is relieving. She discusses special conditions and needs such as abnormal vital signs, pain, changes in general condition. The charge nurse makes special note of patients receiving inhalation therapy, patients with indwelling catheters, patients receiving parenteral fluids. Treatments, medications, and specific plans for the day are discussed. Anything unusual in terms of physical environment of the ward, personnel changes for the tour of duty, or special events for the institution are reviewed.

MAKES NURSING ROUNDS TO OBSERVE AND DETERMINE PATIENT NEEDS

The LPN charge nurse, as well as team leaders and nursing supervisors, make "rounds" on patients. Nursing rounds are made at the change of shifts, with physicians, with students and staff, during visiting hours, and whenever patient needs necessitate a visit by the charge nurse.

Nursing rounds at the beginning of a tour of duty is an organized way for the charge nurse to observe patients and determine needs. The LPN charge nurse should observe each patient in an organized manner; a planned "general to specific, head to toe" observation plan is recommended:

- Make general observation
- Note and feel skin
- Note head: eyes, nose, ears, hair, scalp, beard, lips, gums, teeth, tongue, breath
- Talk with patient; listen
- Check chest: abdomen, back genitals
- Have patient move; lift covers
- Examine extremities
- Discuss appetite, activity, elimination
- Discuss desires, likes, dislikes, complaints
- Note mental/emotional condition, reaction to institutionalization, treatments, nursing care.

Nursing rounds permit the charge nurse opportunity to secure and give information to patients and staff. Often she interprets policies pertinent to patient care and institution management while on rounds. Observation of nursing ethics in principle and practice is possible through nursing rounds. Rounds offer an opportunity for guidance, teaching, and on-the-spot teaching between the charge nurse and staff; personnel development on the job is enhanced through rounds. Orientation to the job, follow-up learning, and staff development continue with the help of the charge nurse as she makes rounds. Establishing rapport, good will, and personal interest in the job of the staff is often accomplished as the charge nurse makes rounds and talks with staff and their patients. A sense of togetherness is fostered when the charge nurse is "with" her staff and patients at the bedside.

Through rounds the charge nurse can assess the physical environment of her unit, as well as the availability, use, and maintenance of supplies and equipment. She can elicit and discuss suggestions for improving working conditions. Patient care and the multiple factors in the environment that affect care are observed.

Nursing rounds are very important for the development of good public relations with the patient, his family, and visitors. The opportunity to meet and talk with people about health, health care, and a particular patient and his needs is possible when the charge nurse makes rounds. Often the charge nurse uses rounds as a way to discuss referral plans with the patient, his family, and the physician.

ASSISTS THE PHYSICIAN WITH EXAMINATIONS AND TREATMENTS

The physician assumes responsibility for initial examination and diagnosis; he prescribes treatment. The effective charge nurse shares observations of the patient with the physician; she interprets and explains treatment measures to the patient and his family. In most cases the charge nurse knows the patient best and she should try in every way possible to assist the physician as they plan patient care together.

DISCUSS PATIENT CARE GOALS WITH PHYSICIAN, NURSING SUPERVISOR, AND STAFF

Communication with the physician, nursing supervisor and staff about patients, their problems, needs, as well as therapeutic goals and approaches, promotes quality patient care. Patient care is planned and implemented by a team of people. The charge nurse evaluates the patient's condition, his needs and therapeutic goal. She finds out what the physician is trying to accomplish in his care of the patient. She asks the nursing supervisor for guidance about nursing care; she involves allied health personnel in planning care: the dietician, the physical and occupational therapists, the clergy, the social worker, and the administrator.

DEVELOPS NURSING CARE PLANS FOR INDIVIDUAL PATIENTS

A nursing care plan is an organized program to provide individualized nursing care based upon the medical therapeutic plan and nursing assessment of patient needs, goals, and approaches. According to Little and Carnevali[1] the rationale for care plans is as follows:

- Nursing care plans are needed to individualize care
- Nursing care plans help in setting priorities
- Nursing care plans help in systematic communication
- Planning is essential to continuity of nursing care
- Planning is needed to coordinate care
- Nursing care plans assist in the evaluation of care
- Nursing care plans contribute to staff development.

Dolores E. Little and Doris L. Carnevali, both professors at the University of Washington and experienced nurses in planning nursing care write:

> The current concept of planning patient care hinges on the belief in the individuality of each patient, hence the need for systematic tailoring of his nursing care to his specific requirements. This planned individualization is carried out in the ordered diagnostic studies, the physicians' therapeutic plan of care, and in the general aspects of nursing activities. It can be done consistently and methodically through the use of written care plans. The written statements of patient problems, goals, and nursing approaches offer a common basis of information to all who

---

[1] Every LPN charge nurse should purchase, read, and study the book Nursing Care Planning by Dolores E. Little and Doris L. Carnevali, a 1969 Lippincott of Philadelphia publication.

5160

read them or who give an oral report from them. In this way nursing care plans contribute to continuity of care - the even progression of care during the stages of illness. They also contribute to, and are influenced by, efforts in coordinating tests, therapy and other non-nursing aspects of care. Plans and progress reports make possible more accurate assessment of nursing care and also contribute to staff development in areas of both knowledge and skill.

In any work setting, the responsibility for creating nursing care plans rests with the nurses who direct or give patient care. There may be total or selective coverage of the patient population in the use of written care plans.

The climate of experimentation, of tentativeness, of alternate solutions, of changing perspectives on problems and priorities, tends to foster a flexible, creative, challenging, patient-centered work milieu; one well suited to the constancy of change in the individual patient and the total patient population.[1]

There are certain common steps and components in the process of planning care, whether it be thought through in a moment at the patient's bedside or carefully drafted in advance. According to Little and Carnevali the basic steps in the process are:

1. Identifying the patient factors that will influence nursing care.

2. Ruling in or ruling out problems and setting current priorities of attention and care.

3. Stating the nursing care problems[2] that have been given current priority of attention.

   a. Setting of the desired patient goals or objectives in the problem area.

   b. Prescribing the nursing actions to be undertaken that will assist the patient in achieving his goal.

   c. Determining what cues will enable the nurse to assess the patient response and the effectiveness of the nursing actions.

4. Revising any or all components of the nursing care plan as necessary in terms of patient response or changes in his situation.[3]

---

[1] Little and Carnevali, Nursing Care Planning, p. 16.

[2] A nursing care problem is a situation in which the patient requires or would benefit from the assistance of the nurse in attaining the desired goal or solution.

[illegible] p. 47.

5161

The nursing history is the first component in planning a patient's nursing care. It is a necessary part of both continuity and individualization. If one considers that continuity must begin with the patient in his home environment and continue throughout the illness experience, then it becomes obvious that the gap between non-patient and patient status, or between home and institution, must be bridged smoothly. The nursing history may make this possible.

The history is the cord of individualization also. It provides the data from the patient to show where discrepancies exist between his previous patterns and those which may be expected of him in his patient role. It also gives beginning data on cues to patient response. The information obtained in this initial contact forms the basis for immediate priority setting and statement of current and potential problems of concern as well as selection and modification of nursing approaches that meet his needs, values and desires.

The exact content areas of the nursing history should prove useful in terms of economy of time and appropriateness to patient care in particular institutional settings. To obtain information that is not used in planning patient care is not justified.

The exact format of a nursing care plan will vary from institution to institution. In most cases the plan will be an integral part of the Kardex. If an institution does not have a particular form for a nursing care plan, several variations are suggested; divide a card in half and lable the two sides as follows:

(1) GOALS	APPROACHES
or	
(2) PROBLEMS	APPROACHES
or	
(3) GOALS	ACTIONS

The following sample plan will give an idea of content for a nursing care plan for a long-term care patient.

GOAL	ACTION
1. Encourage further independence and responsibility for self.	a. Accept offers of help from patient or request his help, especially on his good mood days.
	b. Praise his efforts to keep his room neat and his help to others as well as himself.

2. Encourage interest in repair of prothesis

   a. Help him to consider situations where being able to walk with prothesis would simplify his life and make it more pleasant.

   b. Ask if he wishes to set aside any of his pay for prosthesis repair.

3. Continue to assist patient in becoming oriented to time and place.

   a. Identify care setting and time when it can be introduced without threatening him or making him seem in error.

Figure 6-1. Planning patient care.

5163

STUDY ACTIVITIES

1. Obtain a nursing care history on one of your patients. Use the following form or any modification of the form that seems appropriate.

NURSING CARE HISTORY

Patient's Name_____ Diagnosis_____

Admitting Date_____ Date of History_____

History obtained by_____

General Information

I. Previous nursing home and/or hospital experience. Yes___ No___

Date of last nursing home/hospital experience_____

II. Previous experience in this nursing home. Yes___ No___

Date_____ Diagnosis_____

III. Kinds of activities carried out by nurses that were helpful.

IV. Kinds of activities carried out by nurses that bothered you.

5164

5163

II. Fluid Habits:

A. Fluid preferences

B. Fluid dislikes

III. Sleep Habits:

A. Usual bedtime?_____

B. Usual number of hours of sleep_____

C. Get up at night_____

D. Nap habits

Time

E. Number of pillows desired?_____

F. Number of blankets desired?_____

G. Windows open?_____Curtains drawn?_____

H. If unable to sleep at home, what things do you do that help you fall asleep?

IV. General Hygiene:

A. Bathing preference: Usual Time

Tub_____ _____

Shower_____ _____

B. Care of teeth:

Type: Usual Time of Cleaning

Natural_____ _____

Dentures_____ _____

5165

V. Visitor and family contact during hospitalization. Yes___ No___

Desire for any restriction of visits. Yes___ No___

If restriction, please indicate desires.

VI. Goal expectations from nursing home experience.

Habits of Daily Living

I. Food Habits:

A. Meal patterns:

	Time	Usual Foods
Breakfast		
Lunch		
Dinner		
Snacks		

B. Food dislikes

C. Food allergies

5166

5165

V. Elimination:

A. Usual bowel habits:

Frequency_____ Time_____

B. Bowel irregularities:

Constipation? Yes___ No___

C. Bladder irregularities:

Yes___ No___

Other Specific Information

Any Specific Questions You Wish to Ask Me?

Observations Made During History Taking:

3. Use the nursing care history and make out a nursing care plan. If possible obtain several other nursing care histories and make out additional nursing care plans. In addition to the history, use personal knowledge of the patients and information available from the charts; try to involve other staff in the activity.

GOAL ACTION

GOAL ACTION

GOAL ACTION

GOAL ACTION

2. Every individual must satisfy certain basic human needs to live, to maintain health, and to affirm his being. These needs relate to the following:

- Environment
- Social class
- The family
- Marriage
- Religion
- Vocational development
- Recreation
- Love
- Sex
- Water
- Food
- Elimination
- Personal cleanliness
- Clothing
- Activity
- Rest and sleep
- Oxygen

Nursing is the act of assisting a healthy, handicapped, ill or dying person to meet his basic needs for life, health, and being. Use the information you have obtained from the nursing care history and complete the following NEED/ACTION PLAN. Basic needs and concept statements explaining the needs are listed on the left-hand side of the page. On the right-hand side, indicate the approach or action you as a nurse would take to help the patient meet this particular need.

5170

PATIENT NEED	NURSING ACTION
Environment	
- The total well-being of an individual is influenced by his surroundings (environment). - Surroundings, belongings, possessions, and valuables are necessary, accepted, and cherished parts of a person's life. - A healthful environment is pleasant, comfortable, safe, and convenient. - The readiness of a person to return to the community and the process of recovery is influenced directly by environment.	
Social class	
- Income, occupation, education, and ethnic status are some of the indeces of social class. - An individual's behavior in part reflects his social class and style of life.	
The family	
- The immediate family includes the father, mother, and children. - The extended family includes such relatives as grandparents, uncles, aunts, and cousins. - There are many significant people in the life of a patient: neighbor, minister, sweatheart. - The need for long-term care by any member of the immediate or extended family affects family roles, relationships, responsibilities, and economics. - Readiness to return to the family is conditioned by behavior and characteristics of the specific family constellation.	

0172

PATIENT NEED	NURSING ACTION
Marriage	
- Most adults of all societies are married. - People may live together in other arrangements than licensed marriage. - Divorce is recognized, although with degrees of disapproval, in nearly every world society. - Feelings of frustration, loneliness, bereavement, and desertion may arise when a husband and wife are separated because of a long-term illness.	
Religion	
- Most people believe in something spiritual or sacred. - Long-term disease or disability may be a contributing factor to some people "becoming more religious" and influence others to "forsake" or question former beliefs and practices.	
Vocational Development	
- Problems might arise when youth and young adults interrupt education and career development because of long-term disability. - Vocational rehabilitation is necessary for many people with chronic disabilities. - Money is required in an industrial society to purchase the necessities and luxuries for healthful living. - Most people work to earn money. - Personal satisfaction and achievement are possible through work. - The desire for economic security is normal for an individual and family.	

0172 0

PATIENT NEED	NURSING ACTION
- Most persons who need long-term care have inadequate financial resources to pay for necessary care. - Stopping work because of a disability or because of retirement may have both psychological and economic crisis consequences for an individual and his family.	
<u>Recreation</u>	
- Play and recreation are important for personal health of people of all ages. - Creative use of leisure time contributes to positive feelings of identity and worth. - Play and recreation are socially acceptable outlets for pent-up energy. - People, well or ill, need to have fun, relax, socialize with other people, and "take one's mind off troubles."	
<u>Love</u>	
- People need love. - An individual needs to love, to cherish, and to aid others. - An individual needs to be beloved, cherished, and aided by others. - Some people are unable or unwilling to love and receive love. - Some people are unable to express hostility openly and state that they "hate." - People may face difficulties and stresses because of separation from loved ones because of long-term illness.	

5173 4118

76 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

PATIENT NEED	NURSING ACTION
Sex	
- Sex is an aspect of psychic energy present and manifested by a person throughout human life. - A sexual relationship is a dynamic and creative phase of living. - Men and women can live without sexual experiences, but their lives will lack much warmth and richness of living closely associated with love. - A long-term disease or disability may bring a person problems and stress and the feeling of being unfulfilled sexually. - People have individual rights in choosing sexual modalities.	
Water	
- Water is necessary for human life. - Fluids and water from foods supply the body with water necessary for bodily processes. - Daily fluid intake balances daily fluid output.	
Food	
- Food is necessary for life. - Carbohydrates, fats, proteins, vitamins, minerals, and water are vital nutrients. - The body needs food for energy, to build and repair tissues, and to regulate many bodily processes. - The Basic Four is a daily food plan to assure necessary amounts of food nutrients. - People have individual differences and food patterns because of cultural, religious, and traditional reasons. - Over or undereating may have nutritional and psychological significance.	

5174 6133

0112 5175

PATIENT NEED	NURSING ACTION
<u>Elimination</u> - Elimination is necessary for life. - Urine is the waste eliminated by the urinary system; feces is the waste material eliminated by the gastrointestinal tract. - Psychological feelings of guilt and dependency may arise when the patient needs assistance with elimination.	
<u>Personal cleanliness</u> - All body surfaces harbor microorganisms and cleanliness is basic to healthful living. - People have different concepts or levels of cleanliness.	
<u>Clothing</u> - Clothing is an accepted necessity for healthful living. - People have varying ideas about nudity and modesty. - Clothing helps regulate body temperature. - Clothing is one component of good grooming.	
<u>Activity</u> - Activity is characteristic of life. - Activity depends upon proper functioning of bones and muscles and the coordination of the nervous and encodrine systems. - Rehabilitation means the restoration of the patient to his maximum physical, social, and economic capacity. - Rehabilitation begins at the <u>onset</u> of any illness or disorder. - Disability or disuse phenomena may be caused by inactivity or activity in a faulty position, or because of weakness or pain.	

PATIENT NEED	NURSING ACTION
<u>Rest and sleep</u>	
- Rest and sleep are necessary to replenish energy. - People can rest without sleeping. - Older persons do not need extensive sleep. - Sleep may be a symptom of withdrawl.	
<u>Oxygen</u>	
- Oxygen is necessary for human life. - Breathing (normal pulmonary ventilation) provides adequate oxygen for body use. - Air pollution contributes to chronic lung disease.	

2712 5170

Chapter 7

COORDINATING STAFF ACTIVITIES

The LPN charge nurse coordinates staff activities for a specific tour of duty. To do this, she:

- exhibits an understanding of basic human behavior
- demonstrates fundamental leadership techniques
- uses management principles and procedures
- communicates verbally and non-verbally: listens, speaks, reads, writes, gestures effectively
- motivates staff to give skilled nursing care to all patients.

EXHIBITS AN UNDERSTANDING OF BASIC HUMAN BEHAVIOR

The whole person, including his physical, mental, emotional, social, and spiritual characteristics and needs, constitutes the realm of human behavior. Basic human behavior reflects an interaction of both hereditary and environmental influences. Hereditary factors refer to those physical and psychical (mental) traits transmitted from parents to child; they are genetically determined. Environment is the aggregate of external emotional, social and spiritual factors affecting the person.

People behave in consistent predictable ways; they also behave in unique different ways. People behave in both similar and different ways. Personality is the sum total of what is most typical and deeply characteristic about a person. Within each society there are ranges in physical and sensory characteristics, in intelligence and educational achievement, in behavior and social relationships. It is important to remember that most people behave in ways which make sense to them. A person's view of himself, his self-concept, influences greatly what he does. His previous experiences (be they good or bad) influence his perception of any new situation and this in turn influences his behavior. Behavior is influenced to a great extent by a person's basic needs and the manner and degree to which they are met.

DEMONSTRATES FUNDAMENTAL LEADERSHIP TECHNIQUES

Leadership techniques include the ability to involve people in a common effort toward a specific goal. It is fairly well accepted today that leaders are not born, nor do they possess specific personality traits. But what a leader does and how he does it are very important, that is, his leadership behavior. Many studies have examined the results of autocratic, democratic, and laissez faire styles of leadership. There is much current interest in leader and group situations in terms of achievement, affiliation, and power motivation.

In general, if you want to be an effective leader you will be flexible rather than rigid. You can choose from a range or combination of leader styles (autocratic, democratic, or laissez faire), as well as a variety of leader behaviors (tell, persuade, consult, join, or delegate). A good leader is aware of her own characteristics, needs and problems. She

also knows the characteristics, needs, and problems of her staff and unit. The leader should assess the many dimensions of the situation and then choose the appropriate style of leadership behavior. The LPN charge nurse may tell staff what they are to do. You might try to persuade staff to accept a decision you have made. Another time you may elect to consult with staff about a decision. You might join staff as "just another member" to work on a problem and reach a decision together. You might delegate a problem to staff for solution; you would define the problem and boundaries within which the problem must be solved and indicate your agreement to support the solution. Study the following examples:

TELL — Helen, would you take Mrs. Hines in 234 off the bed pan. Mary, her aid, cut her finger and is having it dressed.

PERSUADE — Fluid intake on too many of our patients is low. Please try to offer fluids at least once each hour for each patient.

CONSULT — Ethel, do you think Mr. Hargraves and Mr. Palmer would be compatible roommates?

JOIN — Let's decide together the kind of staff party we want.

DELEGATE — We want to show our appreciation to Gertrude. Her husband is being transferred and she will leave us in two weeks. Usually we spend between $5.00 and $8.00 on a gift or little party. Would you three ladies plan something appropriate?

As an effective leader, you must be honest in dealing with your staff; let them know how much influence they have and how you will use your authority. Sometimes in an attempt to be democratic or fair, it may be tempting to avoid responsibility by involving others in decision-making in which the responsibility is clearly that of yours. Do not try to avoid responsibility by the simple expedient of involving others in a decision. Allow staff to participate in decision-making whenever it is feasible; but make necessary decisions yourself when the situation requires this.

By virtue of your position as charge nurse, you are an authority figure. You are responsible for the total nursing care of every patient on the unit for a particular tour of duty. Tasks number in the hundreds. A wise leader will keep in mind both the immediate problems and tasks as well as the long-range patient care goals and unit objectives. Whatever your individual style of leadership or the particular behavior you select, person-centered leadership as over against task-centered leadership usually proves most effective for everyone involved.

USES MANAGEMENT PRINCIPLES AND PROCEDURES

Patient care is a group effort the the LPN charge nurse is the leader of the group. The effective charge nurse will implement a variety of management principles and procedures. Management principles and procedures include the ability to plan, coordinate, guide, and evaluate the activities of others.

The effective charge nurse will view her unit as an organism not a machine. The unit is a living, flexible, changing, complex network of relationships among people who are trying to achieve individual and group goals. The wise charge nurse involves staff in as many decision-making situations as possible especially decisions which they will implement. She strives to establish mutual confidence as the basis for cooperation rather than an authoritarian-obedience basis. Whenever possible the charge nurse relates to staff in a face-to-face manner. Person-centered leadership as over against task-centered leadership is more effective in meeting personal and group goals.

A good charge nurse strives to establish a two-way flow of communication; "feedback" opportunities should be many. The nurse works with her staff to develop unit objectives and individual nursing care plans so that patient care standards can be relevant to staff tasks. The charge nurse develops a collaborative relationship with supervisors, peers, and subordinates.

As a leader the charge nurse tries to increase her own awareness of personal behavior and its effect on others. She examines her own attitudes and assumptions as they affect job performance and relationships. She strives ever to increase her knowledge of staff as individuals, a group, and a unit. She tries to increase her skill in diagnosing human situations, that is, just what is going on. She tries to increase her own understanding and skill relative to change and the process of change. She strives to create a unit in which individuals may obtain optimum personal and work satisfaction and unit objectives may be achieved:

The effective charge nurse tries to maintain face-to-face work groups at all levels. She involves people together to solve problems and face issues. She is aware of individual, group and unit needs. She works to establish and maintain a supportive communications climate. Whenever possible staff are involved in decision-making that affects group norms and goals. The charge nurse fosters individual initiative through group cohesion. She is flexible in establishing group goals and procedures.

COMMUNICATES VERBALLY AND NON-VERBALLY

Good communication means that persons concerned with communication understand what each is trying to communicate. It in no way guarantees that people will do what we want them to do, believe what we want them to believe. We can understand perfectly well the position of another person and still refuse to do what the communication attempts to get us to do. What you mean to say, what you actually say, and what the other person hears may differ. In general, however, realistic understanding and effective increase where there is clear communication.

Communication is the way one person conveys, imparts, or shares feelings, acts, and thoughts with another person. Communication is a fusion of impressions and expressions. An impression is what the person takes in. Listening and reading may be considered the intake or impressions. An expression is what the person gives out. Acting, speaking, and writing are output or expressions.

5179

The LPN charge nurse communicates with the patient, his family and visitors. She may ascertain an important subjective symptom, reassure a crying child, teach an older gentleman how to clean his dentures properly, chat about the mid-east crisis, or listen while a lady prays.

Because patient care is shared by many people round-the-clock, communication between the LPN charge nurse and other members of the health team is vital. She must be able to follow and implement written and oral directions from the physician. Through "report," "rounds," team conferences and patient care assignments she communicates with the nursing staff. The patient's medical record is an example of a very important written form of communication. The ability of the LPN charge nurse to report and record in an accurate and meaningful manner is an important function.

Communication with the patient and about the patient is one of the most necessary aspects of modern health care.

LISTENING

Purposeful, interpretive "hearing" is listening. Listening conveys feelings, facts, and thoughts from one person to another. Hearing is mere recognition of sounds; listening is reaction to and interpretation of significant sounds. A person learns to listen, but he also listens to learn. Listening therefore is active, not passive. It is purposeful and very basic for learning. A person listens to acquire information and to see the relationships among ideas. Listening brings pure auditory pleasure; it lets one appreciate the moods, the meanings, the humor, and the pathos of another individual. Never be too busy or too lazy to listen properly. A patient may confide in the housekeeper simply because she took the time to listen to him attentively. Suggestions for effective listening include the following:

1. Listen for a purpose.
2. Be attentive and courteous:
   - look at the speaker
   - give the speaker your attention
   - respect the speaker's opinions.
3. Think critically while listening:
   - recall
   - analyze
   - comment
   - question.
4. Appreciate and enjoy what you hear.
5. Discriminate fact from fancy; recognize "propaganda."
6. Evaluate the worth of what was said.

READING

Recognition, comprehension, and interpretation of written symbols are reading. Reading conveys feelings, facts, and thoughts from one person to another. Reading is a necessary communication medium for the LPN charge nurse. Written orders and directives about the patient must be read with interest, perveived accurately, understood correctly, and

interpreted therapeutically. Through the printed word, the nurse as well as the patient gains pleasure and emotional satisfaction as they learn more about the physical world, other lands and cultures. Through reading a person gains further understanding of self and is able to extend and develop special interests. Suggestions for effective reading include the following:

1. Identify the purpose of written communication.
2. Perceive and study the words.
3. Understand and comprehend phrases, sentences, ideas, and the theme.
4. Interpret the meaning of written communication:
   - recognize relationships of purpose, ideas, and viewpoint
   - recognize emotions, motive, mood, and tone
   - develop a sensory image
   - relate to personal experience
   - make judgments and draw conclusions.

ACTING

Communicating by gestures, facial expression, and touch is acting. Acting conveys feelings and emotions from one person to another. The newborn infant communicates as he reacts with his whole body. He cries to express discomforts and demands, and he quiets down from fussing when his needs are met. Reflex activity is acting or communication. Overt and covert gestures are ways children and adults communicate. Facial expression, with or without language, is a powerful mode of communication. Touching is communicating. Recently, many articles and books have appeared about body language. Suggestions for effective "acting" include the following:

1. Gesture in a free, natural manner.
2. Parallel conversation with appropriate facial expression.
3. Handle the patient in a gentle, confident manner.

SPEAKING

A system of vocal symbols or sounds is speaking. Speaking conveys feelings, facts, and thoughts from one person to another. Language is a system of vocal symbols or sounds. A meaning exists for each sound or combination of sounds in a particular language. Language is a means of communication, a source of pleasure, and an outlet for emotions. The infant makes a few throaty sounds; he learns to babble, coo, gurgle, chortle, and eventually to speak. Speech is very important in the total development of the child. The ability to make friends, to acquire a sense of security, and to instill self-respect and mutual respect is, to a considerable extent, dependent upon a child's ability to speak easily and well. Language is important in maintaining good mental health in the adult. Speaking is a key communication medium. The saying "It's not so much what you say but how you said it," is very true. Practice the following variations in voice flexibility with the single word "Oh."

Say	with	to express
Oh-h-h-h	rising inflection	surprise or excitement
Oh-h-h-h	falling inflection	disappointment
Oh-h-h-h	no inflection	boredom

Study the following examples of variation in voice stress:

DID Mr. Harris refuse his shower?
(Meaning - I am surprised that he refused.)

Did MR. HARRIS refuse his shower?
(Meaning - Are you sure it was Mr. Harris?)

Did Mr. Harris REFUSE his shower?
(Meaning - Are you sure he refused? Perhaps he misunderstood.)

Did Mr. Harris refuse his SHOWER?
(Meaning - Are you sure it was his shower he refused?)

Conversing, discussing, interviewing, and reporting are the forms of speaking most frequently practiced by the LPN charge nurse with the patient and staff. Friendly, spontaneous expression is conversation; the charge nurse visits with the patient about his grandchildren. In a discussion, remarks center around a topic, and all contributing comments bear upon the subject; the charge nurse shares observations about the patient at the 10:30 A.M. team conference. When the charge nurse admits a new patient to the unit, she asks certain preplanned questions, she listens attentively; this is a form of interview. Giving information in an accurate, brief, clear manner is reporting; the LPN charge nurse reports to the nursing supervisor that George Armstrong, Bed 2, Room 364 has a blood pressure of 80/40 at 2:00 P.M.; bleeding from the rectal area is increasing. Effective oral communication - conversing, discussion, interviewing, and reporting - is a requisite for the LPN charge nurse. Suggestions for good speaking include the following:

1. Converse and discuss in a spontaneous, firendly, poised, self-confident manner.
2. Practice social courtesies when speaking:
   - listen attentively to others
   - wait until another has finished before beginning to speak
   - refrain from conversing when someone is talking to a group
   - respect private conversations of others.
3. Interview in a planned, orderly, sequential manner.
4. Report information in an accurate, brief, clear manner: who, what, when, where, why.
5. Enunciate clearly and pronounce words correctly:
   - use speech organs properly - lips, teeth, tongue, jaw, nose, roof of mouth, and larynx - to produce clear sounds
   - maintain good posture, deep breathing, and slow steady exhalation
   - learn standard acceptable English
   - produce vowel and consonant sounds properly and clearly
   - practice acceptable pronunciation of words; use a dictionary
   - recognize differences in volume
   - achieve vocal flexibility through variations in stress, pitch, inflection, and rate.

WRITING

Formation and placement of word symbols on paper constitute writing. Writing conveys feelings, facts, and thoughts from one person to another. Writing is a necessary communication medium for the LPN charge nurse. The

5182

patient's medical record or chart is a written, legal record of the history and progress of the patient. The medical record is utilized by the institution for therapeutic, education, research, and administrative purposes. The LPN charge nurse communicates to others through various tour of duty and special written reports. Observing precedes all recording, and reporting frequently accompanies it. Written communication must be accurate, brief, and clear. Accuracy means factual evidence, understanding, and interpretation of observations. Brevity means presentation of essential ideas only and omission of unnecessary details, using as few words as possible. Clarity means presentation of all important ideas in a complete, sequential, legible manner. Many institutions request that nurses print. All entries on the medical record and written reports should be in ink; erasing is not permitted. Letters should be consistent in size, slant, spacing, and formation. The LPN charge nurse signs for each entry, her name and title. Suggestions for effective writing include the following:

1. Understand the function of words and phrases.
2. Identify subject and predicate of simple sentences.
3. Recognize and compose declarative, interrogative, imperative, and exclamatory sentences.
4. Spell words correctly - both ordinary words and medical terms.
5. Capitalize and punctuate correctly.
6. Print or write legibly.
7. Strive continuously to improve content and mechanics of written communication.

MOTIVATES STAFF TO GIVE SKILLED NURSING CARE TO ALL PATIENTS

The LPN charge nurse is responsible for staff effectiveness, because in large part, it is through her staff that she nurses her patients. Because she is in a leadership role, she is also responsible for guiding her staff toward personal and group satisfaction and achievement in their work.

First, the LPN charge nurse motivates her staff to give skilled nursing care to all patients through example. She is a good nurse. Second, she communicates to her staff the belief that skilled nursing care makes a difference - a difference for the patient and his family, a difference for the individual staff member, as well as a difference for the unit and total institution. Third, the LPN charge nurse "helps staff help themselves" establish and meet patient care and job satisfaction goals.

STUDY ACTIVITIES

1. Describe your own personality.

2. Describe the personality of a "subordinate," for example, a nurses' aide.

3. Describe the personality of a "superior," for example, the director of nursing or the administrator.

4. Describe a ward situation in which you would TELL a nurses' aide what to do. Why did you choose this kind of leadership behavior?

5. Describe a ward situation in which you would PERSUADE a nurses' aide to accept a decision you have already made. Why did you choose this kind of leadership behavior?

6. Describe a ward situation in which you would CONSULT with a nurses' aide about a problem. Why did you choose this kind of leadership behavior?

5186

7. Describe a ward situation in which you would JOIN your staff and work on a problem and reach a solution together. Why did you choose this kind of leadership behavior?

8. Describe a patient care situation in which you would DELEGATE a responsibility to a nurses' aide. Why did you choose this kind of leadership behavior?

9. In what ways do you communicate <u>most</u> effectively? Why?

10. In what ways do you communicate <u>least</u> effectively? Why? How can you change this?

5'88

11. The LPN charge nurse motivates staff to give skilled nursing care to all patients. Try out the following goal setting exercise on yourself and adapt it for use with staff.

    a. Identify patient care and/or job satisfaction goals that are important to you. Describe as clearly as possible (3) three patient care and/or job satisfaction goals that are meaningful to you and give the dates when you expect to reach them. These goals may be nursing, career, personal, ward, or institution goals. Don't just dream them up. They should be real goals or ambitions that you have.

    (i) My first goal is

    I intend to reach it by

    (ii) My second goal is

    I intend to reach it by

    (iii) My third goal is

    I intend to reach it by

5189

b. Team up with a colleague and discuss the goals you have set. Ask and answer the following questions.

(i) The Need: How important is this goal to you? What will it mean in your life?

(ii) Activity: What things are you presently doing to achieve this goal? What things are you planning to do in the near future to achieve it, i.e. three to six months?

(iii) Anticipation of Success: How confident are you of reaching this goal? Why? What will you do after you have achieved it?

(iv) Anticipation of Failure: What are the possibilities of your failing to reach this goal? If you do fail, what will you do next?

(v) Personal Blocks: What hang-ups in your own personality or "self" could keep you from reaching your goal. How do you plan to overcome them?

(vi) Environmental Blocks: What situations or circumstances exist in the "world" (the ward and the institution) that could hinder you in reaching these goals? How do you plan to overcome them?

(vii) Help: What other people (in the ward or institution) or or things will you use to help you achieve your goals? How will you use them?

c. Restate your first goal.

(i) My first goal is

I intend to reach it by

d. Plan the action steps to achieve this goal. These steps should should be specific steps that you actually intend to take. For each action step, you should include how it will be measured, a date on which you will review your progress, and the final accompoishment date. (See next page.)

PLANNING ACTION STEPS TO REACH FIRST GOAL

Action Steps To Be Taken	How I Will Measure My Progress	Specific Dates For Progress Review	Specific Accomplishment Dates

e. List what you believe are personal strengths that could help you reach your first goal.

Personal Strength	How I Can Use This Strength To Reach My Goal
1.	
2.	
3.	
4.	
5.	

2135 3193

g. List environmental or world obstacles (the ward or institution) that might keep you from reaching your first goal. (For example, staff turnover is high; employees seem concerned with salary only.)

World Obstacle	What I Can Do About It (Do I Need Help?)
1.	
2.	
3.	
4.	
5.	

2134

h. Review your goal-setting achievement plan individually or with a colleague. Ask and answer the following questions.

(i) Is the goal specific, measurable, and time-phased?

(ii) Is the goal realistic and attainable, or am I just doing some wishful thinking? What results do I expect?

(iii) Is the action plan too general? How will it be tested?

(iv) Are the dates realistic for the goal and action steps?

(v) Are there any strengths that I have not planned to use for attaining this goal?

5196

(vi) Are there any obstacles or blocks which I have not anticipated?

(vii) When is the first progress review? How will information be gathered for this review?

(viii) Will I be able to take the action steps?

(ix) Do I really want to?

5197

2136

Chapter 8

IMPLEMENTING PATIENT CARE

The LPN charge nurse implements patient care for a specific tour of duty. To do this, she:

- develops plans to meet on-going needs of all patients
- develops plans for common types of emergency situations
- assigns personnel in terms of patient needs and staff proficiencies
- helps staff care for patients with special needs, the patient with mental illness, the dying patient
- coordinates work with that of other departments such as dietary, housekeeping, physical and occupational therapy, social service
- seeks guidance and assistance when problems are beyond scope
- prepares and gives verbal and written reports about patients: conferences, nurses' notes, tour of duty and special reports.

DEVELOPS PLANS TO MEET ON-GOING NEEDS OF ALL PATIENTS

A plan is an organized way to try to do something well. For example, ward plans or routines are guides to help staff give the best nursing care possible in the existing facilities with the present personnel.

Every health care institution has policies and procedures that govern and guide its operation. Every ward has a policy manual and/or nursing procedure book. These are plans to help meet the on-going needs of all patients in the most effective, efficient way. These policies or procedures relate to patient care in general as well as such events as admission, transfer, discharge, and death. Policies guide relationships with physicians, the laboratory, the kitchen, social service, the maintenance department, the laundry, the pharmacy, and administration.

The LPN charge nurse utilizes plans or routine ways of doing things when she requisitions a diet, orders drugs, or requests laboratory work. Routine plans are helpful in ordering linen and maintaining necessary equipment and supplies. Tour of duty reports, the narcotic record, interdepartment and interagency correspondence are examples of plans or routines. Plans are used to work out weekly staff assignments, vacation time, coffee breaks and meal time. Plans and routines have been developed for emergency situations. The patient's medical record is a planned or routine way to record observations in an efficient, meaningful way.

Plans and routines are most useful when they are developed by the people or groups who will implement them. Plans are less effective when they are superimposed down on a group from administration. Every plan or routine should be clear in terms of goal (purpose) and approach (action). Plans and routines should be reviewed periodically to assure currency. Written plans and routines facilitate accessibility by the entire staff at all times. Misunderstandings and misinterpretations of intentions are fewer when plans are written.

DEVELOPS PLANS FOR COMMON TYPES OF EMERGENCY SITUATIONS

Emergency or disaster situations may occur on an individual or mass basis. Shock, hemorrhage, or acute respiratory distress are individual emergency situations requiring immediate lifesaving measures. Fires, explosions, storms, earthquakes, as well as thermonuclear attacks, are mass disaster situations. In general, all patients are in dependent situations - dependent on staff for assistance. Plans for common individual and mass emergency situations are required for licensure of any institution for patient care. For example, Conditions of Participation; Extended Care Facilities requires the following:

> 405.1136 Condition of Participation - Disaster Plan. - The extended care facility has a written procedures to be followed in case of fire or other disaster.
>
> (a) Standard; Disaster Plan. - The facility has a written procedures to be followed in case of fire, explosion or other emergency. It specifies persons to be notified, locations of alarm signals and fire extinguishers, evacuation routes, procedures for evacuating helpless patients, frequency of fire drills, and assignment of specific tasks and responsibilities to personnel of each shift.
>
> (b) The factors explaining the standard are as follows: (1) The plan is developed with the assistance of qualified fire and safety experts. (2) All personnel are trained to perform assigned tasks. (3) Simulated drills testing the effectiveness of the plan are conducted on each shift at least three times a year. (4) The plan is posted throughout the facility.

The Red Cross First Aid Course or the Medical Self-help Course is included in the curricula of some practical/vocational nursing programs. First Aid is the immediate and temporary care given the victim of an accident or sudden illness until the services of a physician can be obtained; it may save the life of the individual, or a group of people; it fosters safety consciousness. Medical Self-help is a program to prepare a person to maintain health and alleviate suffering during any period of disaster when professional care and normal services might not be available. If you did not receive either course as a student, please enroll in a class as a post-graduate. You might suggest that such a class become an inservice activity at the institution for other nurses and aides. A local vocational school or college might offer the course as part of its continuing education or adult education program if it knows the need exists.

The LPN charge nurse constantly reminds her staff of the accident-prone nature of older people and persons who are handicapped. Preventing an accident or emergency is always best. The charge nurse practices safety consciousness in terms of ward environment; she notes spilled water, side rails that are down, litter. She assumes responsibility for a safe and confortable environment for patients and staff; this includes general cleanliness, lighting, storage, noise air control, odor, and insects.

Figure 8-1. Implementing patient care.

5200

ASSIGNS PERSONNEL IN TERMS OF PATIENT NEEDS AND STAFF PROFICIENCIES

The LPN charge nurse is responsible for nursing care of all patients; in addition, she coordinates the activities of all staff. This means matching individual patient care needs with individual staff proficiencies.

Satisfactory patient care assignments result from assessment and evaluation of individual patient needs and knowledge of preparedness and proficiency of each staff member. The LPN charge nurse must be familiar and understand job descriptions for various staff; she must know the experience and education background of her staff; she must be aware of the personality of her people.

If the LPN charge nurse is an effective leader, that is, if she (1) exhibits an understanding of basic human behavior, (2) demonstrates fundamental leadership techniques, (3) uses management principles and procedures, (4) communicates verbally and non-verbally, and (5) motivates staff to give skilled nursing care to all patients, patient care assignments rarely will be questioned. Behind her back griping and complaints will be few.

Sometimes the charge nurse may utilize multiple assignments, that is, two or more staff to care for certain patients. This kind of patient care assignment might prove effective for difficult cares.

Skill at patient care assignment comes through knowledge of the patient, the staff, and with experience.

HELPS STAFF CARE FOR PATIENTS WITH SPECIAL NEEDS

GERIATRIC NURSING[1]

I. Adequate Self-Concept and Security:

Personal needs become paramount to the chronically ill person. The aim of nursing care is to give a feeling of self esteem and self accomplishment to the elderly patient, therefore, nursing care is directed towards assisting the patient to maintain the functions of daily living to the best of his ability. A lack of motivation on the part of the patient is a major problem in the nursing care of the geriatric patient, this is due to this lack of self esteem. Patients tend to relax and allow things to develop as they will; they take the path of least residtance.

Nurses may teach new skills or patterns to patients only if motivation is present and time is made available. Every motivating device available must be employed.

---

[1] This section, Geriatric Nursing, was prepared by Mrs. Carmen F. Ross, R.N., M.A., Director of the Mount Sinai Hospital School of Practical Nursing in Miami Beach, Florida. The LPN charge nurse curriculum was field tested at this school; Mrs. Ross served as project director and main instructor.

0095 5201

1. Praise and recognition
2. Keep material in the context of the familiar as much as possible, relate new learning to old
3. Provide time, never appear to push
4. Help the learner to understand the task
5. Keep the stimulus and response together when demonstrating or explaining.

The nurse must consider the loss of speed and the need for motivation. The greatest difficulty comes in attempting to organize old familiar material in new and strange ways. Memory deteriorates and new material is readily lost while old material is retained. The patient develops rigidity of thinking and follows patterns even if he knows they are not working. This major difficulty in altering patterns results in failure of logical thinking. The individual retreats into extraneous discussion when faced with difficult problems.

The current level of functioning is relative to the original peak of earlier functioning. If familiar tasks are maintained and exercised, these skills will remain - hence the emphasis upon activities of daily living. The greater his ability to care for himself the greater the self esteem of the elderly patient.

Problems in motivation arise because the elderly person has lived longer and has some actual loss of capacity to function, and also because he has lost many of his peer group and persons who were important and close to him, they are no longer living or within close contact go give meaning to his life. At times he does not always accept his differences from other age groups.

There is a general slowing down of responses based on slowness of decision as to how to respond, especially in complex and unfamiliar tasks. The stimuli come too rapidly or in irregular fashion, with a result of jerky, piecemeal performance, due to an overlap of activity with the previous response. The nurse should try to structure the situation for the older adult so his central nervous system will have time to make the appropriate response. Instructions should be presented slowly, using rhythmic stimuli - avoiding hurried, confused or emotion-laden orders.

To maintain feelings of self worth, call the patient by his or her preferred name rather than "Grandma," etc. Give explanations to patients. Avoid opportunity for your patient to make mistakes, anticipate his needs, thereby preventing him from constantly asking for service which tends to increasingly point up his limitations. Recognize that creativity and productiveness are still the right of old age - provide opportunity for the elderly to be engaged in growing things and creative experiences.

II. Stress and Adjustment:

Adjustment is related to earlier behavior. Stress is associated with a loss of life enjoyment, loss of feelings of self confidence and usefulness, a general loss of zest and a loss of resiliency. Stress of any kind yields increased anxiety, recovery is usually slower. Anxiety is demonstrated by the magnifying of normal aches and pains producing a hypochrondriasis with

excessive attention to digestive and eliminative functioning and exaggerated reports of sleeplessness. Psychiatry offers an approach to stress in the elderly by focusing upon recognition of the patient's patterns of dealing with stress - determined by his constitutional makeup, his temperament, biologic hereditary makeup, organic assets and deficits, his environment, emotional motivation and dynamics.

While youth is normally optimistic and looks forward, age recognizes failings and tends to look backward. All patients regress during periods of stress or illness, elderly patients more so. The nurse's role in anxiety is to:

1. Focus the energy from anxiety into useful channels of activity and purpose to alleviate stress
2. To identify the cause of externally produced anxiety and lessen these if possible
3. To recognize clues to the patient's buildup of anxiety and his patterns of response
4. Supply thereness of the nurse in period of extreme panic and stress
5. Supply focus of disturbing hostility.

It becomes increasingly difficult to adjust to the lack of emotional resources. The tranquilizing drugs are useful as a supportive measure to control anger, frustration and upheaval. It is helpful to a patient's security if he can remain in familiar surroundings. Drugs are not a cure, but a supportive measure. In unfamiliar surroundings a patient is often deserted by those meaningful to him and feels surrounded by disinterested strangers.

Needs as seen by the elderly patient include:

1. Good health - a chance for a variety of experiences
2. Place to live and enough money to live comfortably
3. Recognition by others - a chance for participation with others.

III. Activities of Daily Living

In the very elderly and incapacitated patient it is extremely difficult sometimes to find ways of maintaining hope and purpose in the patient's life. But without hope and purpose one only exists, he does not truly live. In our efforts to help such patients we must avoid the extremes of doing too much and of doing too little. A variety of interests and projects that occupy the hands or the minds can be offered, but the nurse's activities should be aimed at motivating the patient toward appropriate activities of daily living and self-care.

A. Maintenance of Motor Skills:

Before any maintenance regime can be instigated, the nurse must first evaluate the patient's condition and identify the physical limitations if there are any. The extent to which any individual can perform day-to-day actions (ADL) is a good indication of his capacities. This should include the walking and non-walking activities such as, being able to sit alone in bed, roll from side to side, and the daily routines such as feeding himself, brushing teeth, combing hair, etc.

If this evaluation of the patient is to be of value, it must occur during each contact with the patient, not just during the initial nursing care given. The nurse must prevent further physical limitations, while attempting to correct those already present. Daily observation is the key here. This is a nursing responsibility to be sure that the auxilliary personnel know what they are doing and what factors must be included in their daily patient observations.

Protective positions to help keep the bed patient in good alignment:

Unless medical orders specify the restriction of motion of certain body areas, bed patients can be prevented from developing physical limitations by a variety of positions.

The protective back-lying (supine) position:

In the back-lying position, the two areas of the body that need particular attention are the feet and the neck. The greatest danger to the feet occurs when they are not held in the dorsal flexion position. The toes drop downward, the feet are in plantar flexion. If this occurs for extended periods of time, the complication of drop foot occurs. During the time the patient is in bed, pillows are always used to support the head. Caution should be used here to prevent flexion of the cervical spine. Both thorax and neck must be supported as well.

Suggested Action	Complications to be Prevented
- Provide a firm supportive mattress	- Exaggerated curvatures of the spine and flexion of the hips
- Use a bed board if necessary	
- Place pillow under upper shoulder, the neck and the head so that the head and neck are held in the correct position	- Flexion contractures of the neck
- Place pillows or arm supports under the forearms so that the upper arms are alongside the body and the forearms are pronated slightly	- Internal rotation of the shoulder and extension of the elbows
- Make hand rolls or use small towels for hands to grasp. If paralyzed, use thumb guides to hold the thumbs in adducted position	- Extension of the fingers and abduction of the thumbs (claw-hand deformation)
- Place sand bags along the hips and upper thighs	- External rotation of the femur
- Place small soft roll on sponge rubber under the knee, sufficient to fill the popliteal space but not to create pressure, and not to exceed 5 degree flexion	- Hypertension of the knees
- Use a foot block or make an improvised firm foot support to hold the feet in dorsal flexion	- Plantar flexion

The protective side-lying position:

This is a welcome relief from prolonged periods of lying on the back. Turning to the side rests certain muscle groups and brings others into use.

Suggested Action	Complications to be Prevented
- Place a pillow under the head and the neck	- Lateral flexion of the neck
- Place a pillow under the upper arm	- Inward rotation of the arm and interference with respiration
- Provide a hand roll for the fingers and thumbs	- Extension of the fingers and abduction of the thumbs
- Use one or two pillows as needed to support the leg from groin to the foot	- Internal rotation and adduction of the femur

The protective face-lying (supine) position:

Lying on the abdomen, face down, can be a valuable and relaxing position if the patient is comfortable in this position and enjoys it. The feet are the only area of real concern. Unless supported or allowed to go over the end of the mattress, they are forced into plantar flexion and the legs rotate inward or outward.

Suggested Action	Complications to be Prevented
- Move patient down in bed so that his feet are over the mattress; or support his lower legs on a pillow just high enough to keep the toes from touching the bed	- Plantar flexion
- Place sponge rubber pads under shoulders	- Forward hunching of the shoulders
- Place small pillow under the head	- Flexion of the cervical spine
- Place a small pillow or some other suitable support under the patient between the end of the rib cage and the upper abdomen if this facilitates breathing and there is a definite space there	- Hyper-extension of the spine; impaired respiration

Protective exercises for the bed patient:

When routine activity is omitted for several days or longer, it is more difficult for the muscles to resume their former task. Therefore efforts to assist patients to maintain good muscle tone must begin with the first day of confinement to bed. This must be continued on a regular daily basis. Maximum range of motion must be included:

Trunk:	Hyper-extension Flexion Extension	Head:	Flexion Extension Hyper-extension
Legs:	Outward rotation Inward rotation	Feet:	Dorsal flexion Plantar flexion

5205

Arms: Flexion
Extension
Hyper-extension
Adduction
Abduction

These exercises must be done regularly to prevent the formation of contractures.

Getting the patient out of bed:

Remember that there is a loss of back strength in your older patients. Hand strength is retained, so let the patient help you assist him. Give your directions clearly and slowly, allowing the patient to respond to one direction at a time. See that his clothing is comfortable yet without dangling belts or strings that will catch on the furniture. The patient's shoes and slippers must provide the needed support without being heavy or cumbersome.

Sleep patterns:

Older patients usually change their sleeping habits. They must avoid fatigue and find the need for more frequent rest periods during the day. They are easily distracted by noise or bright lights, and they sleep intermittently throughout the night. If this is not too distressing to the patient, don't worry about it. The patient's not sleeping seems to distress the nurse more than it does the patient.

B. Nutrition and Oral Hygiene:

Nutrition is more than diet. Proper nutrition includes not only ingestion of adequate and balanced quantities of all necessary nutritive elements but also digestion of foods, their absorption, transport to the tissues and utilization by the cells. Impairment of cellular nutrition may result from any one or more of several factors:

1. inadequate nutritional supply (such as dietary deficiencies, digestive failure, oxygen lack due to anemia)
2. inefficient distribution (circulatory impairments)
3. ineffective utilization of food elements (hypoinsulinism, asphyxia, enzyme deficiencies)
4. accumulation of injurious metabolic debris (such as azotemia, uric acid deposition)

The rate of metabolism diminishes in man with the process of aging. This therefore affects nutrition in several ways. There must be a reduction in caloric requirements and in some cases eating habits must be altered. Habits are probably one of the greatest obstacles in the path toward obtaining an optimum diet by the majority of persons. Habits of eating play a most significant role in nutritional problems. Habits may last longer than life itself, for they may be transmitted from one generation to the next. The longer habits have been indulged in, the more rigidly they become fixed.

Water: The total intake of beverage fluids should be such that the 24-hour urinary volume is a minimum of 1500 ml. In hot weather this may mean fluid intake of 3 Liters or more, but in ordinary cool weather, with moderate activity, an intake of 2 Liters is optimal. In the older person it may be desirable to space the fluid intake. Small amounts at relatively frequent intervals rather than large quantities at one time. Water is vital, not only for urinary excretion but to avoid constipation and assist the weakened digestive process.

Calcium: With advancing age it becomes more difficult to maintain a positive calcium balance. Loss of calcium from bone leads to osteoporosis and serious fragility responsible for fractures, therefore the dietary calcium requirements of older persons will be much higher.

Protein: The elderly are prone to suffer from protein starvation more than other forms of deficiency. Insufficient protein is a significant factor in the pathogenesis of tissue wastage, anemia, bone atrophy and edema. Mild deficiencies may be manifested primarily by a sense of habitual fatigue. Unfortunately, the majority of older persons dislike or resent the precription of milk. Milk is not only a valuable source of protein but a major source of calcium. Skim milk may be preferable to whole milk if one wants to avoid the increased fat intake. Other significant sources of protein are cheese and lean meats. The requirements of the older person are similar to those of a younger person, 1 Gram of protein per Kilogram of body weight per day.

Care of the Mouth and Teeth: General good health is as essential as cleanliness for maintaining a healthy mouth and teeth. Frequent cleansing of the mouth and the teeth aids in reducing dental caries.

Toothbrushing: It has been shown that bacteria in the mouth react with food particles to form an acid which predisposes to dental caries. Therefore, frequent cleansing of the teeth and mouth is a requisite for maintaining a healthy mouth and teeth. After using the toothbrush, the mouth should be rinsed thoroughly with clear water. Mouth washes may be used but never in lieu of the toothbrush. The toothbrush must be small enough to reach all teeth. If food is wedged between the teeth, dental floss may be used, provided care is taken so as not to injure the gums.

Dentures: The removable type are removed and cleaned with a brush, after each meal. Denture brushes are helpful but not necessary if only a regular brush is available. Some dentists recommend that removable dentures remain in place except for cleaning. If the patient has been instructed to remove his dentures while sleeping, a disposable denture cup is convenient and easy to use. Keeping dentures out for long periods permits the gum lines to change, thus affecting the fit of the dentures.

C. Bathing and Skin Care:

The skin of older patients is thin, delicate and very sensitive to trauma and pressure. The loss of subcutaneous fat leads to wrinkling and sagging, sweat glands atrophy and the general excretory function of the skin is decreased.

Bath: Daily bathing is unnecessary, in fact, may be harmful if too frequent. For the incontinent, a tub bath or thorough cleaning of the

8056

5207

anterior and posterior pelvic region is sufficient. Use a mild soap and be sure that the skin is rinsed free of soap after cleansing. Avoid alcohol rubs or the use of any scented lotion or cream that may contain alcohol. Bathing should be followed by the application of lanolin or emollient creams which are gently massaged into the skin. Particular attention should be given to bony prominences and weight bearing areas. Powders may be used but sparingly. Avoid application in the body creases, to prevent caking or irritation.

Care of the Nails: Both toe and finger nail care is extremely important. Because of limitation in peripheral circulation, the nails become hard and thick. Before any specific care is given, the feet and the finger nails must be soaked in a mild soap solution to soften and make cutting of the nails and care of the cuticle easier. Nails should be cut straight across and the sharp edges smoothed with an emery board or nail file.

Care of the Hair: The hair becomes thin, dry and lifeless because of the diminished blood supply to the scalp. Daily massage to the scalp followed by brushing with a soft bristled brush will help to maintain the body and texture of the hair. Lanolin cream in small amounts, along with oil treatments preceding shampoo may also be given. Frequent shampoos are to be avoided because of the already decreased supply of natural oils. Attention should be given to the type of shampoo selected. Avoid the use of harsh soaps or shampoos which contain even a minimum amount of alcohol. The hair style should be designed to suit the desires of the patient. A simple style can be both comfortable and attractive. The distribution and quality of hair changes with age. The axillary and pubic areas become fine and scanty while the eyebrows become coarse and bristley. Hair on the face, particularly chin and upper lip area can cause distress. Shaving the area or using a pumice followed by the application of a cream will prevent drying. Plucking hair from the chin may be necessary. Do not pluck hair from a mole or other growth; just cut close to the skin surface as necessary.

D. Bladder and Bowel Control:

Patients tend to worry about bowel function, tending to forget that with less food intake (which is common in elderly patients) and lessened activity there is less bowel function. Regularity of going to the toilet is a helpful stimulus. Mild cathartics are useful. Lack of attention to signals leads to constipation. Attention to diet is necessary.

Frequent micturition - night frequency - is an early sign of kidney function impairment. Retention of urine and mild infection may be due to decreased muscle tone of the bladder. Observe for distention. Most elderly females complain of a troublesome discharge and may have a mild infection. A mild douche may be ordered.

The condition of incontinence causes embarrassment and discomfort to the conscious patient and leads to skin irritation and decubiti ulcers. The causes are: disorders of the central nervous system pathways, loss of conscious control of bladder and bowel, spinal cord damage, loss of

09208

bladder and bowel reflex action, actual tissue damage of bowel and bladder - sphincters or supportive tissue. Control is based upon normal voluntary and involuntary muscular action coordinated by normal urethra-bladder reflex.

Between voiding the bladder outlet is elevated by contracture of the levator ani muscle in the perineum and the muscular walls of the bladder relax. As the bladder fills with urine the involuntary nerve endings at the trigone are stimulated by the weight of the urine and increased muscle tone of the bladder. The internal sphincter relaxes releasing urine into the posterior urethra. Stimulated by this, the bladder muscles contract preparatory to emptying the bladder. As involuntary stimulus occurs some charges overflow to the pudenal nerve (voluntary nerve from the sacro-spinal cord). This allows the central nervous system to send appropriate stimuli to the levator ani muscle which causes the muscle either to quickly and forcefully pull the outlet higher to prevent overflow or lower to allow outflow. If this mechanism is disturbed, incontinence results.

Frequently indwelling catheters are used to correct incontinence. There are some disadvantaged of the catheters: (1) possibility of infection, (2) loss of bladder muscle power. The catheter should be clamped and opened at intervals of 2 - 4 hours, (3) stones may form due to irritation of a foreign body.

Toilet training of the incontinent adult may be helpful. Observe the patient's normal voiding pattern and adjust accordingly. Watch for frequent small amounts of voiding. This usually indicates that the muscles are not contracting strongly enough to empty the bladder completely and the patient is voiding overflow. This may be due to pressure of a distended bowel. This can be relieved by a flatus tube or enema.

External drainage for male patients should be available. Old age may cause relazation of muscles and consequent incontinence. Most elderly males have hypertrophy of the prostate, making urination difficult. Practice in exercise of muscular control can tend to correct the relazation of the muscles, this is taught - contract abdominal, gluteal and perineal muscles while breathing normally.

E. Visual Care:

Adaptation is decreased and the visual field narrows, speed of focus is decreased. There is a great need for better lighting, light stairs, hallways, night lights at the bedside and in the bathroom areas. There is a need for special care at dusk.

Accumulation of secretions due to lower lid droop, with a decrease in conjunctival secretions which is followed by irritation and tearing occurs. These secretions should be washed from the inner to the outer canthus. Take care not to press upon the eye ball. Most persons over the age of 60 wear glasses at least for reading. Care of glasses is a major problem in nursing homes. Glasses should be clean and available at all times. If they are lost, confusion and the inability to cooperate may result.

0156 805209

F. Auditory:

There is an increasing incidence of deafness within the sound range of the human voice after the age of 75 (2 men out of 10 and 1 woman out of 10 have noticeable deafness).

The nurse should check to determine if she is being accurately understood. Many patients are unaware of this disability or are unwilling to admit it. Don't rely upon the presence of a hearing aid, it may not be turned on. Any noise or voice not clearly understood is annoying to a deaf person. Speak clearly and slowly in view of the patient (for lip reading).

G. Body Perception:

Some loss of pain sensitivity is present after the age of 50. This may be dangerous as the patient may fail to report injuries that he may have suffered. There is also a loss of the sense of movement of body parts, loss of the sense of balance (due to inner ear changes). Frequent falls occur due to a lack of balance. There is a need for stair and hallway railing, tub and bathroom grips, canes and supports. These self-help devices will aid the patient's self-respect.

H. Anatomical and Physiological Changes:

Slower cell division, healing is slowed, defenses respond to infection more slowly and less effectively, loss of elasticity of connective tissue, decreased speed of response and decreased strength with increased rigidity of body structure such as the rib cage occur. There is a lessened chest expansion which leads to lung congestion. This condition causes problems following anesthesia or during conditions such as pneumonia.

The bone is rarefied, causing easy fractures. Fatty infiltration of cells and loss of elasticity of blood cells cause poor circulation which results in poor adjustment to prolonged changes in position; such as lowering of the head or prolonging standing. The blood collects in the lower extremities and it causes dizziness, fainting and falling. A lack of essential nutrients in the blood is quickly felt. These people do not tolerate a lack of food easily. Any small change in the blood pressure is more significant for the older age group. There is gradual degeneration and atrophy of the nervous system in old age, with impaired sensation. The gag reflex is less acute, causing the patient to be more prone to aspiration.

Diminished chest expansion makes it imperative that oxygen content be normal in the available air supply, fresh air is necessary but one must avoid drafts. Arthritis and fibrositis are aggravated by chills, drafts, dampness and changes in barametric readings. A decrease in adipose tissue and circulation to the small outer arteries makes it difficult to withstand chills. There is lowered skin temperature due to the lessened circulation. Clothing should be adapted to the needs of the patient. The wearing of their own clothes should be encouraged.

I. Reaction to Drugs:

As a rule the elderly patients require smaller dosages of sedatives and larger dosages of stimulants. The intramuscular drugs are slower to react due to the slowed circulation. Culumative effects of the drug may

1158

5210

occur due to kidney and liver function impairment, which slows excretion of the drug from the body, especially digitalis (causing heart block), bromides, and barbiturates.

There are many satisfactions in store for the nurse who chooses geriatric nursing. All the principles involved in nursing care of the acutely and chronically ill may be needed at various times. She will need to learn well the philosophy and psychology of caring for the chronically ill and aged. She will need experience in a wide variety of nursing skills and will find there is much for her to learn as she works in this particular field of nursing. Many of the points mentioned under rehabilitation and recreation will become more meaningful and useful when applied to patients living in "homes." They will need attention to clothing, meals, recreation, and companionship there as they would in their own homes. Arrangements should be made to assure them some privacy and a homelike atmosphere. Some effort and imagination may be necessary in providing a specific place for each individual to call his own, and into which others may not trespass unless asked. A corner of a ward may be all the patient has but everyone should respect his right to call it his domain and allow him to keep there the few personal belongings he may treasure.

THE PATIENT WITH MENTAL ILLNESS

No illness afflicts the whole person more than mental illness. When a person is unable to cope with the demands of his internal desires, the realities of daily living, and the dictates of his conscience, conflict develops and a mental illness may result. Hereditary factors are responsible for some kinds of mental illness. In most cases, however, factors within the environment cause mental illness. It is most prevalent in highly industrialized nations. There are more people in hospitals with mental illness at any one time, than with all other diseases combined. Many children in the United States are mentally ill and only a very small percentage of these are receiving any kind of psychiatric treatment. Overwork, fatigue, death of a loved one, financial difficulties, home problems, dissatisfaction with work, and a sudden change of living habits, or some romantic difficult may precipitate a mental illness.

Neurosis and psychosis are the two major categories of mental illness. A neurotic reaction is a mental illness in which thinking and judgment are impaired to the degree that the individual tries to resolve the conflict in a manner that handicaps his effectiveness as a normal functioning person; loss of contact with reality is minimal in a neurotic reaction. There are the following types of neurotic reactions:

- Anxiety reaction: anxiety is the prominent feature
- Phobic reaction: pathological fear exists
- Conversion reaction: an unconscious conflict is disguised
- Dissociative reaction: certain functions or parts of the personality are detached
- Obsessive-compulsive reaction: ideas and acts recur despite their irrationality
- Depressive reaction: severe depression exists.

5211

A psychotic reaction is a mental disturbance in which there is loss of contact with, or serious distortion of, reality. Organic psychoses result from impaired cerebral function. Arteriosclerosis, senility, alcoholism, and neurosyphilis are common causes of organic brain syndrome; infections, toxins, and head trauma may cause organic psychoses. Functional psychoses are psychogenic in origin; that is, there is no defined physical cause, and no apparent structural changes in the brain exist. Schizophrenic reaction includes a group of reactions characterized by apathetic, silly, or unexpected emotional responses. Many types and variations of thinking defects occur. Delusions and hallucinations may be apparent. Paranoia and paranoid reaction are syndromes characterized by overuse of the mechanism of projection. A complex system of delusions exists. Affective reactions are disorders in which there is a disturbance in mood (affect). For example, the person may be depressed or elated (manic). Changes in mood occur without apparent cause and vary in degree and duration from what is considered normal.

Emotional factors are presumed to cause such conditions as peptic ulcer, essential hypertension, bronchial asthma, and ulcerative colitis. These illnesses are called psychosomatic disorders or psycho-physiological reactions.

Personality disorders are characterized by defective behavior patterns. For example, the paranoid personality is undully sensitive and suspicious. The person with an emotionally unstable personality is immature and becomes very excited and ineffective under minimal stress. Individuals with sociopathic personalities exhibit antisocial or asocial behavior. In most of the personality disorders, anxiety is minimal; however, the behavior patterns tend to be chronic.

Anxiety is a state of tension which tries to warn a person of impending danger. Anxiety is very important in the dynamics of normal and abnormal behavior. It may be the driving force behind the successful businessman. Anxiety may cause unreasonable emotional trauma, render the individual ineffective, and reduce him to a dependent state.

Anxiety has both psychic and somatic components. The anxious person perceives discomfort and feels apprehension. The anxious person may have sweating or flushing, rapid respiration, tachycardia, palpation, anorexia, nausea, vomiting, cramps, diarrhea, as well as urgency and frequency.

To deal with anxiety the person enlists certain defenses. Suppression is conscious purposeful forgetting. Repression is purposeful but unconscious forgetting. Regression is returning to a more satisfactory emotional level. Rationalization is ascribing acceptable motives to thoughts or behavior that has other motives. Projectionis attributing one's own thoughts or actions to another person or object. Introjection is turning of unacceptable tendencies against one's self. Compensation is attempting to overcome feelings of inferiority. Reaction formation is manifesting a very unacceptable or dangerous impulse in the exact opposite direction. Sublimation is diverting instinctual drives into socially acceptable behavior. Denial is conscious negating fact or reality. Identification is adopting personality characteristics of another, especially one who is admired. Isolation is separating unacceptable conscious impulses from the rest of mental content and thus rendering them harmless.

5212

A physician, hopefully a psychiatrist, diagnoses a mental illness following a complete medical and psychiatric examination. A team of people - psychiatrist, psychologist, social worker, occupational therapist, recreational therapist, nurse, and clergy - help the patient with a mental illness recover.

Specific attitude therapy may be prescribed by the psychiatrist. When the staff takes the initiative and approaches the patient, this is an attitude of active friendliness. The patient must take the initiative when relating to the staff in passive friendliness. A matter-of-fact attitude is a neutral approach to the patient. Kind firmness is a positive, coaxing manner with the patient. Work therapy may be prescribed for the patient; a menial monotonous task may satisfy the need for punishment in a depressed person. Planned recreation is therapeutic; playing volleyball allows a patient to express hostility within a group setting in a socially acceptable manner.

The nurse is a key member of the therapeutic team. Observation and communication are two very important nursing (therapeutic) measures. Observation is purposeful, planned, and objective. The nurse observes the patient's general behavior - his appearance, speech, actions and attitudes. She notes his emotion (mood) - is the patient anxious, agitated, elated, or depressed? She is alert to the patient's thought content. An illusion is a misinterpretation of a real, external sensory experience. A delusion is a false belief that is maintained against logical argument and despite objective contradictory evidence; for example, a patient has delusions of grandeur when he imagines that he is the Secretary General of the United Nations and that he is guiding quarreling, disputing nations to world peace. A hallucination is a false sensory perception in the absence of an actual external stimulus. Observations indicative of the patient's insight, intelligence, orientation, and memory are important.

Communication with the mentally ill patient is therapy. To be therapeutic, the nurse accepts the patient as he is. She relates with the patient in a consistent manner and at his level of understanding. Communication that increases anxiety, fosters an intimate nurse-patient friendship, and is judgmental for the patient is untherapeutic.

In addition to observation and communication, the nurse helps the patient meet his basic physical needs for life and health. She sees that his nutrition is adequate. The patient needs exercise, recreation, rest, and sleep. The nurse institutes necessary safety measures to protect the patient from himself, to protect other patients and to protect herself. Special supervision might be needed for the aggressive patient or for the suicidal patient.

Treatment for the patient with mental illness may include establishing a therapeutic environment, psychotherapy, certain somatic techniques, and medications. Psychotherapy refers to regularly scheduled interviews between the patient and the therapist. This may be done on an inpatient or outpatient basis. Talking with the therapist may help the patient. For example, the therapist may help the patient understand his feelings and behavior patterns. He may reassure the mother that hostile feelings toward her three young children are not so abnormal. He may listen while the patient ventilates. This talking-it-out therapy is called catharsis.

5213

In some cases, the therapist may suggest that the patient modify his environment - for example, that the husband and wife send the children to the grandparents for a month and plan a vacation together. In psychoanalysis the therapist and patient strive to uncover unconscious conflicts and deal with them in such a way that the patient gains insight into his illness and recovers. In group therapy one therapist and several patients talk together. Group therapy is often used in conjunction with individual therapy. In recent years, many new kinds of encounter and sensitivity group sessions have been tried.

Certain somatic techniques are used, to a lesser extent today than in former times, to treat an individual with a mental illness. Electroshock therapy (EST), sometimes referred to as electroconvulsive therapy (ECT), is useful in relieving symptoms of depression. An electric current is passed through electrodes applied to both temporal areas, producing a grand mal seizure. Following 8 to 20 treatments, symptoms improve. The patient is up in 30 minutes. Narcoanalysis with intravenous injections of amobarbital (Sodium Amytal) or thiopental (Sodium Pentothal) makes some patients more accessible to therapy. Hydrotherapy using a cold wet sheet pack, a prolonged continuous bath, or a pool is used in some institutions to manage patients. Insulin coma therapy has been used successfully and produces remissions of symptoms in many cases of withdrawal. Regular insulin is injected, and following 25 or more comas improvement is seen. A skilled team of doctors, nurses, and attendants is necessary to give safe insulin therapy. Psychosurgery may be performed to relieve symptoms when other techniques fail. The association fibers between the frontal lobes and the thalamus are sectioned, presumably detaching the emotional component from the psyche.

Medications are being used with increasing frequency to treat mental illness. Such barbiturates as phenobarbital and pentobarbital (Nembutal) are useful sedative and hypnotic drugs. Chloral hydrate and paraldehyde help delirium. The "tranquilizing" or ataraxic drugs reduce psychic tension without a corresponding sedative or hypnotic effect. The patient thus remains accessible to psychotherapy. Serious toxicity problems accompany prolonged use of many of these drugs. Some of the major tranquilizing drugs in use today include:

- Chlorpromazine (Thorazine)
- Procloperazine (Compazine)
- Promazine (Sparine)
- Perphenazine (Trilafon)
- Thiopropazate (Dartal)
- Promethazine (Phenergan)
- Reserpine (Serpasil)
- Meprobamate (Miltown, Equanil)
- Mephenesin (Tolserol)
- Azacyclonol (Frenquel)
- Hydroxyzine (Atarax)
- Phenagycodol (Ultran)

A wide variety of stimulant and antidepressant drugs are being used to combat mental depression. The effectiveness of these drugs varies greatly from patient to patient. Amphetamine (Benzedrine), dextro-amphetamine (Dexedrine), and methamphetamine (Desoxyn) are used with patients with mild to severe depression. Imipramine (Tofranil), isocarboxazide (Marplan),

5214

nialamide (Niamid), and phenelzine (Nardil) are used in depressive reactions. When used discriminately drugs are of great value in adjunctive management of many psychogenic disorders. Medications should augment, never replace, a total program of psychotherapy.

THE DYING PATIENT.

All people die. Death is a significant phenomenon in the growth and development process. Death is the cessation of life. Although the life-span increases, the force of mortality remains. The LPN charge nurse working with long-term care patients encounters the dying patient and death frequently. She must help her staff cope with this difficulty in a supportive, positive way. Nursing includes helping a person die in a dignified and meaningful manner.

Death may be sudden. In most cases, however, a variety of changes in body structure and functions are associated with the process of dying. The skin may become pale or mottled. The hands, ears, and nose may be cold. The person may perspire profusely. The body may lose muscle tone; the jaw may sag and the cheeks may become flaccid. The person may breathe through his mouth. Respirations may be rapid and shallow or abnormally slow. Breathing may be noisy and rattling. There seems to be an accumulation of mucus in the respiratory tract. There may be a general slowing of circulation. The person may be unable to swallow; he may be involuntary of stool and incontinent of urine. The person may lose his ability to speak. Hearing usually remains intact. The eyes may look sunken, the lids half-closed, and the eyeballs rolled up. The person may show evidence of anxiety, distress, and restlessness; he may moan.

Death is a significant factor that conditions the thoughts, feelings, and actions of all individuals living in the twentieth century. A great variety of attitudes about death exist.

- Death is mysterious and caused by evil spirits and demons.
- Life is a tedious preparation for the glorious hereafter.
- Death is the end of the good life on earth.
- Death offers the possibility of salvation or new birth.
- Rituals enhance the meaning of death.
- Learning "how to die" is important.
- Dying is an intensely romantic experience.
- Death is the inability of the biological organism to live.

A person develops a concept of death. The young child denies death as a natural and final process. To him, death is like sleep. You are dead, then you are alive again. Death is similar to a journey. You are gone and then you come back again. Consequently, young children may seem to be rather callous toward death. They may express immediate sorrow but soon forget about it. The older child accepts the idea that a particular peson has died. He does not accept death as something that eventually happens to everyone - particularly to him. By the age of nine or ten most children recognize death as inevitable for all persons and as something that can come to them. Most children accept biological death.

Intense feelings are often associated with "dying" for the teen-ager. Popular songs and expressions depict dying as the utmost in romantic self-sacrifice. The adolescent, however, begins to think about death in religious and philosophical terms; he ponders an afterlife. Death is somewhat of a mystery to the adolescent. The young adult affirms life! Death is an unpleasant fact that may end everything. In times of disaster or war, death may be a factual reality for the young adult; he often views death with a sense of hostility. The increasing incidence of illness makes the middle-aged adult more aware of death. His thoughts about death are in part responsible for feelings of depression that characterize this developmental stage. The middle-aged adult often views death with a sense of futility. The older person recognizes the nearness of death. His attitudes toward death parallel his attitudes toward life. The older person who remains future-oriented seems best equipped to die. The older person often shares his feelings and concerns about death with the clergy. Death remains an ever present possibility for the health as well as the long-term ill person in this twentieth-century war-torn, nuclear age.

A PSYCHOLOGY OF GRIEF REACTIONS[1]

Introduction

Little Johnny's pet dog, Rags, was hit by a car three days ago and was "put to sleep" by the veterinarian. For the last two nights Johnny has cried himself to sleep with Mom or Dad sitting by.

In every instance of grief reaction deep emotional feelings dominate. These grieving emotions are caused by the experience of loss. It may be the loss of a loved pet, a parent, or a series of losses.

For Johnny, the natural expression of loss and "licking of the wounds" has begun and will be worked out. For another person the working through of the pain may be delayed, blocked or distorted. These varied reactions produce different appearances for the same experience of loss. We want to explore these very evident grief reactions and also some mild, everyday grief reactions.

Four facts are important in the psychology of grief. First, grieving is a natural life experience. Next, the characteristics and stages of grief reactions can be identified. Third, some kinds of grief reactions call for special attention. Finally, this emotional process can be helped by an alert community and prepared congregation.

Natural Origins of the Grief Reaction

Grief is a deep and moving sense of loss. Grief reaction is a person's response to the loss. The type of grief reaction varies according to the personality of the person, the kind of loss, and the environment and social setting. For example, a flexible personality reacts differently to losses of varying degrees of severity while a less mature personality reacts the same way to all feelings of loss. In addition, the people or circumstances surrounding the grieving person may help or may block the grieving process.

---

[1] By Donald W. Manthei, presented to the Adult Forum at Second Church, Newton, Massachusetts, November 9, 1969.

5216

The grief process is based in personality development. The basic nature of human personality development which provides the foundation for the experience of grief is the twofold process by which we first develop a sense of selfhood apart from other persons and physical objects and then invest ourself in other persons and objects. For example, the infant first gratifies his own needs only to discover as his senses of sight, touch, and smell develop that there is a dimly perceived other person, the mothering person, who is answering his cries and fussing. This is the first awareness of the difference between self and the world. It is a very necessary distinction which continues to develop. The child at age two is still working on this sense of selfhood when he proclaims, "I wanna do it!" "This is mine!" "give it to me!" And in adolescence, as he interacts with persons of uniquely different backgrounds and appearances, he is still refining his selfhood - his identify.

Along the way of development the person is also involved in a second natural process - that of investing himself in things, persons and patterns of behavior that interest him, satisfy his needs and provide him with new hopes or challenges. For example, the infant becomes attached to the bottle or breast, to mother, to a toy or blanket, to father, to pets, to friends and to his house.

But, life brings still another experience - the loss of some of these loved objects, persons and things. The bottle is taken away. A sitter sometimes replaces Mommy. Father goes to work. Pets get lost or die. Friends get interested in other children. The family moves to a new house and neighborhood.

Although we usually think of death as loss which causes grief and mourning, these other losses bring similar reactions. We need to recognize the natural place of investment and loss in the life process. The anxieties of separations and perceived loss arise in many day-to-day events and during a significant period of transition. Often the lonely and depressed college student is one who as a child moved frequently or during a crucial time of peer group adjustment and thus lost the important peer group interaction. College provides a new challenge to reinvest himself, but frightened of yet another loss he is now unable to do so. He needs help in recognizing the opportunity before him and help in removing barriers to using his new chance.

For children, death, family moves, and separations are crucial. In adolescence a previous feeling of loss may be reactivated at a time of transition from high school to college or a job. The drag of the past loss makes the unknown of the future more frightening. For adults accidents, ill health or aging may cause feelings of loss of opportunity, property and abilities.

A grief reaction may be caused by a single significant event, several minor connected events or an unconnected accumulation of losses. A single loss might be the death of a loved one. An example of connected events is the loss of one's health or ability which leads to loss of job and then loss of income and security. A grief reaction may result from unconnected events such as the move of a friend, loss of important sale, and simultaneous accidents which disable one's car, home or a family member.

Description of the Grief Experience

Characteristic signs of grief reactions are feelings of pain, shock, anxiety and anger. In normal grief reactions these are openly felt and expressed: one flinches with pain, stands stunned, wonders what has happened, worries what will be next, and demands: "Why has this happened to me?" "It isn't fair!"

The briefest way we can describe grief is in six common stages.[1] These stages may appear in any sequence. The first four stages appear for several days or even a few weeks. They are related to the painful process of disengaging oneself from the lost person or object.

1. Shock - disbelief, "This is unreal." The state of shock may be for twenty minutes to an hour. Physical signs of shock are deep sighing, choking, dryness in the mouth and throat, sensations of emptiness, lack of power, and chill.

2. Emotional release - crying, moaning, rapid talking, flailing.

3. Isolation - feelings of loneliness, desires for withdrawal, depression. Common behavior involves recurrent complaint of physical symptoms; identifying with the deceased; and idealizing the lost person.

4. Guilt and anger - for example Mrs. A's reaction. Her husband died in heart surgery. Recently they had had a disagreement which she now recalls and feels guilty. "Did that contribute to his heart condition and his death?" she worries. Now people are taking over the funeral arrangements and she strikes out with anger at their "intrusion." Another person in the same situation may react with anger toward the lost person.

The release of feelings - all kinds, are important for letting go of the relationship which death has ended. The last two stages involve reinvestment in life without the loved one.

5. Return to routine - with the necessary changes.

6. Reinvestment - in new relationships and interests; new life with others.

Grief Reactions Requiring Attention

Normal grief work is open and expressed, providing both disengagement and reinvestment. By contrast abnormal grief reactions are defensive and attempt to cover the emtions, pain and sense of loss. The attempts to cover or forget grief seem to arise from fears of our own death which we do not want to face. (Reports from the experiences of the dying person would help our understanding at this point, but that is another topic and an important area for future discussion.)

---

[1] Erich Lindemann. "Symptomatology and Management of Acute Grief," The American Journal of Psychiatry. CI (1944), pp. 141-49.

5218

The common forms of abnormal grief reactions are those that involve delay and distortion. (See the Lindemann article.) In delayed grief there is little or no reaction at the time of loss because it is blocked. Sometimes circumstances prevent the reaction of grief from being expressed. A college girl whose mother lost emotional control at grandmother's funeral found that trying "to help Mother" prevented the student herself from normal release of emotions.

Or a young married man called from a distance to his parent's home to handle father's funeral arrangements rushed to leave work and family. From the time he arrived before the funeral until he left the day after, he was busy with details. Then he rushed back to work and his own family. He had no time or opportunity to react.

Delay of a grief reaction may also be caused by personality factors which block expression. A common example is a stoic silence which denies the pain while professing that the deceased "would want us to be strong" and "to carry on." Such rationalization can thwart a natural emotional release and lead to an otherwise unexplainable physical illness. This delayed grief reaction brings us to the second major group of abnormal grief reactions.

Distorted grief reactions involve over-reaction or under-reaction to loss at the time of the loss or during the next several weeks. Signs of distortion are seen in over-reactions through excessive physical complaints, continued weeping, extreme guilt and hostility. Under-reaction may appear in neglect of self or tasks, loss of feeling and later result in depression.

These conditions call for professional help by the trained clergyman or therapist. The grieving person needs help in searching for the earlier cause of delay or distortion in reaction. Assistance through understanding, clarification and possibly instruction may help to resume the grief work.

Two cautions are relevant to us when we are in the presence of a mourning person. First, too many people who require the mourner's attention and alertness may repress and delay the grieving process. Second, persons may force denial on the mourner or cause distortion in his grief reaction. A young college girl reported her "Frustration" in attempts to "cheer" her boyfirend who had just had his arm permanently crippled in an auto accident. A young minister tried to cheer a young woman whose father had died of cancer at the age of forty-five. His comforting picture was "The joyful Christian funeral" he attended for his own aged grandmother. Both are examples of uninformed "helpers."

Constructive Considerations

We must recognize that the emotions and behavior involved in grief reactions are normal. This knowledge can help us understand what we may already have experienced as well as help us to see the "natural" in what we could wrongly be inclined to see as bizarre and unmentionable.

There are at least three further concerns to consider. Those who grieve need assistance, time for quiet to "lick their wounds," and later opportunity to talk it out. To facilitate these conditions we may offer

various types of support through provision of food services and other necessities, opportunities for reinvestment in new relationships and special care for those with delayed or distorted reactions.

We also need to be concerned for social conditions which create a climate for undue loss - poverty, divorce, the lonely adult, etc.

Finally, we need to become prepared for emergencies and disasters. We have gathered valuable knowledge about the intense care of victims of major disaster. We need to share this knowledge so that "potential" victims can seek and use such care in sudden need. And we need to train more personnel in these skills of intensive care.

The grief process is part of an intense and natural emotional experience. It follows life's natural development: differentiation and investment of ourselves, the experience of loss which requires subsequent reinvestment of self.

Descriptions of the characteristics and stages of grief reactions help us place our reactions and the reaction of others in perspective. Examples of delayed and distorted reactions can alert us. And constructive considerations lead us to issues beyond the individual into the congregation and community.

COORDINATES WORK WITH THAT OF OTHER DEPARTMENTS

The nursing department coordinates patient care, 24-hours per day, seven days a week. The efforts of many other departments within the institution are necessary and important for patient care: dietary, housekeeping, physical and occupational therapy, social service. At one time most of these services were an integral part of nursing. Today the nurse does not actually scrub the floor, but she is concerned that the floor is clean. She may not cook the meal, but she is concerned with diet as well as the attractiveness of the tray and the patient's interest in eating.

Because so many different people, so many different departments, share patient care, coordination of work is necessary. Because nurses are acquainted with so many functions of the other departments and because they care for patients around the clock, patient care coordination has become an important nursing function. With the great increase in allied health personnel at all levels - professional, technical, and aide/assistant - patient care coordination is a very complex task.

Guidelines and policies for inter-department working together must be established and well-understood by the supervisors and directors of the departments involved. It should not be left for a nurses' aide and dietary aide to figure out on the spot the procedure for passing trays. Doris A. Geitgey, professor at the University of Washington and nursing leader, offers some practical suggestions on how to coordinate work with that of other departments in her book, A Handbook for Head Nurses.

1552 5220

SOME HINTS ON HOW TO IMPROVE RELATIONS WITH OTHER SERVICE DEPARTMENTS

Doctors: How to work with the medical staff.

a. Take the initiative in establishing friendly relations and mutual understandings with the house staff.
   - Welcome the new doctor to your ward.
   - Ask the resident physician and the interne how you can be of most assistance to them and then do your best to follow their requests.
   - Try to meet the idiosyncrasies of the individual physician.
   - Learn the physician's plan for the care of his patients.
   - Encourage mutual planning for patient care.
   - Talk over your ward problems with your physicians.
   - Explain the nursing situation to your doctors; they will be more cooperative if they know about unusual difficulties.
   - Do your part as planned when mutual decisions have been reached.
   - Ask for a conference with your medical staff when important problems arise.
   - Encourage the patient's confidence in his physician.
   - Show your loyalty to your medical staff.
b. Follow the doctors' orders in a meticulous manner.
   - Accept orders cheerfully and without complaints.
   - Don't let orders accumulate; carry them out as quickly as possible.
   - Report to the doctor any inability to carry out his orders, and explain the reasons.
   - Encourage the doctor to write his orders according to hospital policy.
c. Keep the doctor informed on his patient's condition.
   - Notify doctors immediately upon the admission of their patients.
   - Report and read accurately the results of treatments.
   - Report all symptoms and reactions of their patients.
d. Make ward rounds with your doctors.
   - Establish a mutually agreeable time for rounds.
   - Take notes of any significant comments made by the doctors or the patients.
   - Have charts and other needed equipment ready for the doctors' use during rounds.
   - If you are unable to make rounds, assign a member of your staff to attend the doctors.

Laboratory Workers: How to assist personnel employed in diagnostic and clinical facilities.

a. Familiarize yourself with tue functions of laboratory facilities and the ward's relations with them.
b. Prepare the patient correctly for diagnostic procedures.
c. See that the patient arrives at the laboratory at the correct time.
d. Arrange for the return of the patient to your ward when the test is completed.
e. If laboratory work is done on the ward, help the technician as much as possible.
   - Greet the technician in a friendly manner.
   - Locate the patient for him.
   - Be sure that the patient is ready for the test.

5221

Nutritionists: How to cooperate with the dietary service.

a. Become familiar with the services provided by the dietary division.
b. Prepare the patients for their meals.
c. Request the number and type of diets necessary for your ward, but don't over-order.
d. Have requests in the proper form and on time.
e. Avoid wasting foods.
f. Ask for conferences as necessary to meet special problems.
g. Instruct your personnel in the matter of your patients' dietary requirements.

Social Service Workers: How to work with the medical social service department.

a. Know and inform your staff about the functions of the social service department.
b. Maintain a friendly, cooperative attitude towards the department.
   - Know and use the name of your medical social service worker.
   - Introduce new workers to your personnel.
   - Take new workers on a tour of your ward.
   - Explain any special functions of your ward.
   - Hold frequent, informal conferences with your worker.
   - Arrange for privacy for the worker and patient during interviews.
c. Accept the help which the medical social service worker can give you in understanding your patients.
d. Encourage your patients to talk with the social worker.

Clinic Personnel: How to link the hospital care of the patient with his out-patient care.

a. Inform yourself and your personnel of the responsibilities of the out-patient department.
b. Make out out-patient referral forms according to the policy of your hospital.
c. Prepare your patient for his first clinic visit.
   - Tell him where the clinic is located.
   - Inform him of the date and time of his appointment.
   - If the appointment is made by another division, tell the patient how he will be notified of his appointment.
   - If any charge is made by the out-patient clinic, explain the cost to your patient so he will be prepared to pay the amount if possible.
   - Stress the importance of keeping the appointment.

Engineers: How to correlate your work with that of the maintenance department.

a. Learn what services the maintenance department provides.
b. Report any mechanical difficulty promptly.
c. Inform the engineer of the location of the trouble.
d. Give the engineers a chance to get to your ward; remember that they have many wards to service.
e. Be courteous and considerate; thank the engineer for his help.

5222

Laundry Workers: How to get along with the linen supply service.

a. Avoid wasting linen.
   - Use linens for their intended purposes (don't use bath towels for polishing shoes; avoid using good linen for cleaning rags; impress upon staff the importance of correct usage of linen supplies).
   - Encourage personnel to use only the necessary amount of linen.
b. Avoid hoarding linen for a "rainy day."
c. Get linen orders in on time and in proper form.
d. Avoid ordering excessive amounts of linen.
e. Gain an awareness of the problems of the laundry department and give due consideration to these problems.
f. Check the linen delivered with the amount ordered.

Druggists: How to stay on good terms with the pharmacy department.

a. Turn in drug orders correctly and at the right time.
b. Avoid ordering large amounts for delivery on the week-end.
c. Order sufficient drugs to meet your ward requirements, but don't overstock.
d. Follow directions of the pharmacy for the care of empty drug and sollution bottles.
e. Eliminate as many "emergency" drug orders as you can.

SEEKS GUIDANCE AND ASSISTANCE WHEN PROBLEMS ARE BEYOND SCOPW

It is imperative that the LPN charge nurse comprehend her functions and qualifications as an LPN and as a charge nurse. The ability and necessity to seek guidance and assistance when problems arise that are beyond her scope are indications of wisdom, maturity, and leadership ability.

The LPN charge nurse is not a lone practitioner; she is an integral part of nursing. According to the Statement of Functions and Qualifications, in semi-complex and complex nursing situations a greater depth of knowledge and a higher level of judgment is required of the LPN; and a closer working relationship with, and the greater the degree of direction by, the autonomous health professional.

In a complex patient care situation, the LPN charge nurse should ask herself the following questions before seeking guidance and assistance:

1. Do the nursing needs of this particular patient indicate assistance from a health professional?

2. What are the components of the patient care situation?

3. Do I have the knowledge, skills and previous experience to handle this patient care situation alone?

4. What kind and how much assistance (direction) do I need? Is it available?

5223

When a ward situation involving staff becomes complex, the LPN charge nurse should ask herself similar questions before seeking guidance and assistance:

1. Does this particular ward situation indicate assistance from a health professional?

2. What are the components of the ward situation?

3. Do I have the knowledge, skills and previous experience to handle this ward situation alone?

4. What kind and how much assistance (direction) do I need? Is it available?

The capable LPN charge nurse does not bother her superiors with problems that are within her prerogative to solve. In an attempt to avoid looking inadequate, the charge nurse should not avoid seeking professional help. Ask and answer the above questions with a complex patient care or ward situation arises. Seek help from a health professional when the situation truly demands.

PREPARES AND GIVES VERBAL AND WRITTEN REPORTS ABOUT PATIENTS

Verbal and written reports about patients between personnel on different tours of duty promote continuity of patient care. The LPN charge nurse gives a complete report on the condition of each patient to the nurse who will relieve her. She mentions special conditions and needs such as abnormal vital signs, pain, changes in general condition. She mentions any special treatments, medications, or events of the day. She comments on anything unusual in terms of the physical environment of the ward, changes in personnel assignments for the coming tour of duty, and special institution events.

Reports should be useful. It is important that the LPN charge nurse understand the purpose of a report. Frequently, both verbal and written reports become "busy work," and this exercise proves to be a gross misuse of skilled nursing time. A good report should be accurate, concise, useful, and interesting. The LPN charge nurse achieves skill at preparing and giving verbal and written reports through knowledge, practice, and experience.

5224

STUDY ACTIVITIES

1. Review staff assignments for a particular tour of duty. What is the purpose of the "plan" or assignment routine? Just how were staff assigned?

2. What one ward plan or routine seems to work best? Why?

5265

3. What one ward plan or routine poses the most problems? Why? How could you help change this situation?

4. Henry Jacobs, an elderly patient in room 303, develops severe respiratory distress. What do you do?

5228

5. What directions would you give your staff in case of a fire on the ward?

6. What knowledges, skills, and attitudes do you believe are most important in caring for older patients? How do you share these with your staff?

5227

7. What knowledges, skills, and attitudes do you believe are most important in caring for the patient with mental illness? How do you share these with your staff?

8. What knowledges, skills, and attitudes do you believe are most important in caring for the dying patient? How do you share these with your staff?

9. How can you and your staff help a patient and his family through a grief process?

10. Review patient care assignments for a particular tour of duty. On what basis did you "match" specific patients with certain staff? Did you use multiple assignments? When? How does your plan for patient care assignments reflect both patient needs and staff proficiencies?

5229

11. What is the most difficult aspect of working with personnel from other departments? Why? How could you help change this situation?

12. What is the most satisfying aspect of working with personnel from other departments? Why?

5230

13. Describe a ward situation in which you would seek guidance and assistance from the director of nursing.

14. Describe a ward situation in which you would seek guidance and assistance from a physician.

5230

5231

15. Describe a ward situation in which you would seek guidance and assistance from administration.

16. A new LPN charge nurse questions the time involved in preparing and giving verbal and written reports about patients. "This is important," you state. Explain your statement.

Chapter 9

EVALUATING PATIENT CARE

The LPN charge nurse evaluates patient care for a specific tour of duty. To do this, she:

- applies basic principles of evaluation
- makes nursing rounds to observe and assess patient care and needs
- assesses patient care plans and modifies as necessary
- assesses patient care given by staff and guides appropriate changes
- appraises self-performance and plans improvement.

APPLIES BASIC PRINCIPLES OF EVALUATION

To evaluate something is to assess, measure, or determine its value or worth. A major responsibility of the LPN charge nurse is to evaluate patient care. Unfortunately, evaluation often becomes a time-consuming, meaningless activity. To be useful, evaluation (1) must be done in terms of criteria or standards, (2) it must lead to action, and (3) it should be positive.

Criteria are established and/or accepted standards. For example, you know in an adult the pulse rate varies from 60 to 100 beats per minute; the rhythm is regular; and the intensity is "full." If you count a patient's pulse and note the rate is 120 beats per minute, irregular and weak, this observation has use only when compared to the known standard or criterion for a normal pulse.

Criteria or standards are both external and internal. Most patient observations are compared with established (external) standards of what is normal: normal temperature, normal skin, normal urine, normal behavior, normal blood sugar, etc. Nursing policies and procedures are another example of external standards or guides for performance and evaluation. Internal criteria are personal achievement goals you set for yourself in terms of performance. Setting personal achievement goals is very important in self-development and personal growth.

Second, evaluation should lead to action. For example, the nurse who observed the fast, irregular, weak pulse did something. She acted. Depending on the exact nature of the patient situation, she may have reported the observation, charted it, called the physician, or given the prescribed medication. But, in any case, her evaluation led to action.

Third, evaluation should be positive. It is so easy to say, "don't do this," "this is wrong." People tend to repress negations. The exasperated LPN charge nurse says, "how many times have I told you that is the wrong way to move this patient." Because of this negative evaluation, the aide repressed the comment and continues to move the patient in the wrong way. How much better if the charge nurse had said, "Mary, may I show you a good way to move Mr. Thompson." This interaction is positive. Chances are the aide will correct her performance because the evaluation is positive.

SESC

5233

MAKES NURSING ROUNDS TO OBSERVE AND ASSESS PATIENT CARE AND NEEDS

Nursing rounds at the beginning of a tour of duty is an organized way for the LPN charge nurse to observe patients and determine needs. During the tour of duty and most certainly at the end of the tour, the charge nurse again makes rounds to observe and assess patient care and needs. Evaluation of patient care and needs must be in terms of criteria or standards, it must lead to action, and it should be positive.

The Kardex and nursing care plans (goals and actions) can serve as criteria or standards against which the charge nurse compares patient care observations. The nurse must determine just how she will measure or assess goals and when a goal should be reached. It might prove useful to design a companion part to the nursing care plan to include REVIEW and ACHIEVEMENT. For example,

GOAL ACTION

REVIEW ACHIEVEMENT

These activities may become unconscious and routine for the experienced charge nurse as she makes her rounds.

Evaluation, patient care observations, should lead to action. The charge nurse reports the difficulty her staff had ambulating Mrs. Daniels; she suggests that P.M. staff might try to walk her following her pain medication. The charge nurse reports that Mr. Gray ate most of his noon meal when the tray was left with him for an hour; she obtained this privildge from the kitchen. She suggests that P.M. staff try to let Mr. Gray feed himself slowly over a long period of time. In both these examples, evaluation (patient care observation) led to action and was useful.

In general, a positive, affirmative approach proves more successful than negation. With conscious practice and experience, the LPN charge nurse can learn to communicate observations in a positive manner and her evaluations of patient care will become more useful.

5234

ASSESSES PATIENT CARE PLANS AND MODIFIES AS NECESSARY

Nursing care plans should be useful. To keep a care plan useful necessitates on-going and periodic evaluation of the plan; revisions may prove necessary because a goal or action was inappropriate or because a goal has been achieved. Little and Carnevali comment about revising nursing care plans as follows:

> All of us like to believe that we do things well. Revision implies that our original work was not good enough. This could, in turn, lead to rejection of the planned care concept, because it gives overt evidence of our lack of perfection. In learning to write nursing care plans, as in learning to walk, our early efforts may tend to be clumsy. The difference is that babies are not deterred by the clumsiness of their first efforts; but adults, including nurses, expect a great deal of themselves; we are chagrined when we do not measure up.
>
> The mental processes and activities involved in planning, giving, and assessing nursing care are infinitely complex. It is reasonable to expect that we will be a long time in achieving a high level of skill in these activities. Physicians who have been prescribing therapy for their entire professional lives continue to encounter patient responses to treatment that vary from their predictions; and they, too, must revise their orders accordingly. So, we nurses also must expect to have both failures and successes. We must study and learn from each of them. When we succeed, we need to know why; when we fail, we also need to know why. Support from clinical research should help us to become increasingly successful in our nursing intervention, just as it has similarly served the medical profession.
>
> Despite knowledge, innovation always involves some risk. When you commit your decisions to writing, as one does in the nursing care plan, you lay your judgments open to the scrutiny of others, and you assume professional responsibility for them. This rather lonely aspect of the nurse's role can be made less threatening if those in authority will acknowledge that there is risk in professional growth and will support - even encourage - their staff to stretch more vigorously so as to achieve their full potential in providing planned nursing care.[1]

ASSESSES PATIENT CARE GIVEN BY STAFF AND GUIDES APPROPRIATE CHANGES

The LPN charge nurse coordinates staff activities; she nurses her patients through her staff and she is responsible for staff guidance and development.

Staff evaluation should be on-going and periodic. If possible, it should be a shared responsibility between the individual staff member and the charge nurse. Both should understand and agree on the purpose and principles of evaluation. The manner of evaluation, the tool or report, should be clear.

---

[1] Little and Carnevali, Nursing Care Planning, pp. 166-67.

5235

Staff evaluation should be in terms of established criteria that are accessible, understood, and used by both staff and the charge nurse. To be useful, the evaluation should be positive and lead to action.

APPRAISES SELF-PERFORMANCE AND PLANS IMPROVEMENT

The LPN charge nurse is a recognized leader. Leadership in nursing necessitates continuing personal and vocational growth and development.

Your work performance will be evaluated by a superior. More important, however, will be the self-evaluation and self-improvement program you plan and institute for yourself. You may choose to increase your ability to lead others. You may try to develop more sureness in yourself - self-confidence. You may try to improve your relations with others. A specific goal may be to gain an understanding of your personnel.

Self-improvement may mean taking advantage of inservice programs at the institution, enrolling in nursing courses at neighborhing colleges, or attending special program meetings of nursing organizations.

Self-improvement also includes ways you strive to be a more effective person on and off duty. Set and strive for personal and vocational goals in terms of self, friends, family, and community.

STUDY ACTIVITIES

1. Evaluation must be in terms of stated criteria or standards. What does this mean? Why is it important?

2. Evaluation should lead to action. What does this mean? Why is it important?

3. Evaluation should be positive. What does this mean? Why is it important?

4. In what ways can you, the LPN charge nurse, make nursing rounds useful?

5. Use the four nursing care plans you developed in chapter 6 and plan a way to assess and modify the plan. Add the following dimensions to each plan: REVIEW and ACHIEVEMENT

REVIEW

ACHIEVEMENT

REVIEW

ACHIEVEMENT

5239

REVIEW ACHIEVEMENT

REVIEW ACHIEVEMENT

2533

5240

6. Use the following evaluation format to evaluate (1) a high school student enrolled in a health occupations assistants' program, (2) a nurses' aide who has been employed three months, and (3) yourself, the LPN charge nurse.

   If possible, explain the purpose and principles of evaluation to the high school student and to the nurses' aide and encourage them to participate in a self-evaluation. See if your immediate nursing supervisor will evaluate you. Then, compare and contrast observations in a face-to-face conference. Evaluation is to be useful. To be useful, it must be done in terms of stated criteria or standards, it must lead to action, and it should be positive.

   Directions for use of evaluation format:

   - Read stated criterion/standard (usually a specific job function).
   - Recall a specific behavior as an example of the criterion/standard.
   - Using the behavior example, assess competency in terms of stated criterion.
   - Identify and indicate "strength" or "weakness" in the area.
   - Offer action suggestions for improvement and professional development.

   (Example) LPN charge nurse

Criteria	Behavior Example	Strength/Weakness	Action Suggestion
Complies with ward safety policies.	Am reluctant to prevent staff from smoking in washrooms.	Weakness	Determine reasons for policy and rule; talk with superior if reluctance continues
Continues to improve practitioner abilities	Attended one-day institute on "Meeting the Special Needs of the Ambulatory Patient"	Strength	Keep posted on professional programs and conferences and try to attend

HEALTH OCCUPATIONS ASSISTANT

Criteria	Behavior Example	Strength/Weakness	Action Suggestion
- Escorts patients (especially those in wheelchairs or who have physical disabilities)			
- Feeds patients			
- Makes beds			
- Writes letters and reads to patients			
- Encourages patients in various activities and interests			
- Runs errands			
- Assists patients with personal hygiene			
- Assists with care of patient environment			
- Assists with passing patient nourishments

AUDIO-VISUAL MATERIALS

(Note: Production data are included if the resource is more likely to be purchased, for example, a filmstrip or transparency. Descriptions only are included if the resource is more likely to be rented or borrowed and if the sources are varied, for example, a film.)

Aging (1963, black and white, 28 minutes)
Shows two elderly gentlemen playing cards; they reveal their attitudes toward life, loneliness, and the younger generation.

Ambulation Training of the Hemiplegic Patient (8mm sound/color). New York, Modern Talking Picture Service
Shows beginning ambulation training of the hemiplegic patient using a handy standy or a pick-up strap, according to the particular needs of the patient.

Basic Nursing Procedures (16 color filmstrips of approximately 50 frames each, scripts, records). New York, Blakiston-McGraw
Introduces and demonstrates principles and procedures basic for nursing action.

Basic Wheelchair Features and Handling (8 mm color/sound). New York, Modern Talking Picture Service
Describes basic features needed in wheelchair suitable for person who can stand when getting into and out of it.

Bed to Wheelchair Transfer (8 mm color/sound). New York, Modern Talking Picture Service
Shows step-by-step procedure for hemiplegic transfer.

Better Up Than Sorry (color/sound cartoon filmstrip). Hollywood, Harris-Tuchman
Shows good bedrail practice; shows good judgment and encourages consistent bedrail practice among all nursing personnel.

Body Mechanics (8 mm color/sound). New York, Modern Talking Picture Service
Shows "dos" and "don'ts" of lifting techniques; emphasizes proper body mechanics to protect patient and aide.

Chronic Bronchitis and Emphysema (1965, color, 32 minutes)
Explains anatomical and functional abnormalities related to emphysema and bronchitis.

Critical Decades (1965, black and white, 31 minutes)
Shows how the family doctor can foster preventive attitudes in his patients; uses case history of a 66-year old woman with severe heart disease to show problems that arise from lack of medical attention during middle age.

Diabetes and Its Long Range Control (1961, color, 35 minutes)
Emphasizes likelihood of diagnostic and therapeutic management of diabetes: discusses diet, exercise, insulin, and oral drugs.

Diabetes and You (1960, color, 21 minutes)
Discusses symptoms of diabetes and importance of early detection.

Diabetes Unknown (black and white, 25 minutes)
Interviews with a variety of individuals with diabetes show how symptoms and treatment vary from person to person.

Diabetes - What You Don't Know Can Hurt You (1964, color, 27 minutes)
Discusses body processes involved in diabetes, its diagnosis and control.

Emphysema (1962, color, 15 minutes)
Describes emphysema in detail, showing case history of actual patient.

Exercises to Mobilize the Shoulder (8 mm color/sound) New York, Modern Talking Picture Service
Shows exercises to preserve or restore range of motions of shoulder.

Fundamental Nursing Principles (159 transparencies, 90 overlays). Philadelphia, Lippincott.
Introduces principles basic for nursing action.

Fundamental Nursing Series (12 color/sound 8 mm motion picture cartridge film loops, 12 Study Study Manuals, 12 Instructor's Guides). New York, Balkiston-McGraw.
Offers complete "package" to learn basic nursing procedures.

Fundamentals of Nursing (22 color 8 mm film loops with Student Guide and Instructor's Guide). Philadelphia, Lippinsott.
Offers a total learning kit for basic nursing.

Growing Up, Growing Older (1968, color, 9 minutes)
Traces life of one person from infancy to old age.

A Halo For a Cap (color/sound cartoon filmstrip). Hollywood, Harris-Tuchman
Describes "do's" and "don'ts" of auxiliary volunteer.

The Hemiplegic Patient; Bed Positioning of the Acute Patient (8 mm color/sound). New York, Modern Talking Picture Service
Demonstrates muscle testing techniques to evaluate hemiplegic's ability to stand.

The Hemiplegic Patient; Passive Range of Motion (8 mm color/sound). New York, Modern Talking Picture Service

Home Management of Disability of Arthritis (1964, black and white, 30 minutes)
Shows rehabilitation procedures for arthritis and similar diseases.

Homes That Care (1958, black and white, 30 minutes)
Describes nursing homes and homes for the aged; stresses treating patients as individuals.

Independent Ambulation and Elevation Activities of the Hemiplegic Patient (8 mm sound/color). New York, Modern Talking Picture Service
Illustrates proper teaching methods as patient progresses with cane to curb, ramp, and stair climbing.

Medicare and You (color/sound cartoon filmstrip). Hollywood, Harris-Tuchman
Answers essential questions on Medicare - what it is, who gets it, who pays for it, how it works, what it covers.

More Than Food (1965, color, 23 minutes)
Emphasizes scope of importance of food service in nursing homes.

Mrs. Reynolds Needs a Nurse (1963, black and white, 38 minutes)
Urges nurses to meet emotional as well as physical needs of patients; shows positive and negative patient-staff relationships.

Orientation to the Use of Crutches (8 mm sound/color) New York, Modern Talking Picture Service
Shows fitting of underarm crutches, the tripod principle and crutch walking, including stairs.

The Patient and Circulatory Disorders (54 transparencies with 99 overlays, Instructor's Guide). Philadelphia, Lippincott.
Includes learnings about normal anatomy and physiology, special tests and procedures, and the patient and coronary disease.

The Patient and Fluid Balance (64 transparencies with 158 overlays, Instructor's Guide). Philadelphia, Lippincott.
Includes information about the state of equilibrium, disequilibrium, and fluid therapy.

Remotivation: A New Technique for the Psychiatric Aide (1958, black and white, 24 minutes)
Describes the remotivation technique for increasing a patient's meaningful appreciation of his environment and his heightened activity in it.

Still Going Places (1955, black and white, 40 minutes)
Describes active therapy program for older people.

Stroke: Early Restorative Measures in Your Hospital (1962, color, 20 minutes)
Motivates physicians, nurses and hospitals to employ early rehabilitation services for stroke patients.

Stroke Patient Comes Home (1964, series of six films, black and white, each 28 minutes)
Includes information about (1) getting around, (2) learning self-reliance, (3) physical well-being, (4) returning to the community, (5) understanding his illness.

Take 2 and See (color/sound cartoon filmstrip). Hollywood, Harris-Tuchman
Illustrates necessity of correlating patient's name and hospital number with orders.

5260

5261

Technique for Propelling Standard Wheelchair by Hemiplegic Patient (8 mm color/sound). New York, Modern Talking Picture Service
Demonstrates manner to teach hemiplegic to use a wheelchair.

There is a Way (1960, black and white, 25 minutes)
Demonstrates patient training in bowel and bladder control following a stroke.

Three Grandmothers (1963, black and white, 28 minutes)
Compares and contrasts role of grandmothers in Nigeria, Brazil, and Canada.

TLC- Tend with Legal Care (color/sound cartoon filmstrip). Hollywood Harris-Tuchman
Describes correct charting, safety precautions, handling orders, correct patient identification, unethical criticism.

To Live Till You Die (black and white, 60 minutes)
Contrasts western points of view concerning the aged; examples from Sweden and Italy.

Transferring From Wheelchair to Bed with Maximal Assistance (8 mm sound/color). New York, Modern Talking Picture Service
Shows safest and easiest way to transfer from wheelchair to bed.

Within the Quiet Zone (color/sound cartoon filmstrip). Hollywood, Harris-Tuchman
Explains costs of hospital care in a frank and meaningful manner.

Yellow Leaf (1957, black and white, 27 minutes)
Depicts pressing problem of older people finding satisfactory living arrangements and adjusting to living in a home for the aged.

DESCRIPTORS - *TRADE AND INDUSTRIAL EDUCATION; *TEACHING GUIDES; *BARBERS; VOCATIONAL EDUCATION; ADULT EDUCATION PROGRAMS; *SERVICE OCCUPATIONS; LESSON PLANS; SKILL DEVELOPMENT

ABSTRACT - Prepared by the Division of Vocational Education of the Connecticut State Department of Education, this teaching guide is the third part of a 4-part series and is for instructor use in presenting the theory and practice of the barbering trade. The contents are divided into six blocks: (1) History of Barbering and Orientation, (2) Instruments and Accessories, (3) Practical Skills, (4) Bacteriology, (5) Systems of the Body, and (6) Chemistry. The lesson plans include the aims, preparation, presentation suggestions, and applications of the various aspects of barbering. Parts I and II are available as VT 012 612, and Part IV is available as VT 012 611, also in this issue. (GEB)

PREPARATORY COURSE FOR THE BARBER TRADE

TABLE OF CONTENTS

Block I, Unit 1 - History of Barbering
Unit 2 - Orientation

Block II, Instruments and Accessories

Block III, Practical Skills
Unit 1 - Haircutting
Unit 2 - Shaving
Unit 3 - Shampooing
Unit 4 - Massaging
Unit 5 - Singeing
Unit 6 - Honing and Stropping
Unit 7 - Hair Tonics

Block IV, Bacteriology

Block V, Systems of the Body
Unit 1 - Cells - Tissues - Organs
Unit 2 - Integumentary (Study of Skin and its appendages)
Unit 3 - Skeletal (Study of Bones of the Head-Face-Neck)
Unit 4 - Muscular (Study of Muscles of the Head-Face-Neck)
Unit 5 - Nervous (Study of the Nerves of the Head-Face-Neck)
Unit 6 - Circulatory or Vascular (Study of Circulation of Blood and (Lymph of the Head-Face-Neck)
Unit 7 - Digestive (Relationship to Barbering)
Unit 8 - Excretory (Relationship to Barbering)
Unit 9 - Respiratory (Relationship to Barbering)
Unit 10 - Urogenital (Relationship to Barbering)
Unit 11 - Internal Secretions (Relationship to Barbering)

Block VI, Chemistry

Theory and Practice

Practical and Scientific Barbering

	Unit	Title
Block I	I	HISTORY OF BARBERING
AIMS:	A	To appreciate the past history of barbering.
	B	To understand the changes and progress in barbering.
	C	To understand the present trends in barbering.
PRESENTATION:	A	THEORY, LECTURE METHOD - ORIENTATION 1. Explain the contributions of various races and lands to history of barbering. 2. Explain how primitive man first cut his hair and compare with methods of today. 3. Explain the influence of superstitions. 4. Explain the significance of the beard in early times. 5. Explain the origin of the word "barber". 6. Explain the role of the barber-surgeons during the Middle Ages. 7. Explain the origin of the influence of the Barber Trade Guilds. 8. Explain the importance of changes which have occurred in barbering. 9. Explain the progress of barbering-your state and community. 10. Explain the requirements to practice barbering in your state.
APPLICATION:	A	Study textbook, Lesson I, Pages 8 - 22.
	B	Review Examination Questions.
	C	Glossary Drill - Word Study
TESTS:		Special Test (Instructional material)

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

QUESTIONS

BLOCK I HISTORY OF BARBERING

1. What evidence is available to prove the existence of barbering in ancient times?

2. What is the origin of the word "barber"?

3. What significance was attached to the wearing of beards in ancient times?

4. What recognition did the Greeks and Romans give to barbering?

5. When and how did barbers learn to become surgeons?

6. What were the duties of the barber-surgeon?

7. When and why were the clergy forbidden to practice surgery?

8. How were the barber-surgeons organized in London to protect themselves against practitioners?

9. What conflict existed between the barbers and surgeons, and how was it settled?

10. What is the origin of the barber's pole?

11. When was the first school for barber-surgeons established in France?

12. When was the alliance between surgeons and barbers completely dissolved in England?

13. How long did barber-surgeons practice their profession?

14. Who were responsible for bringing the barber-surgeons to America?

15. What discoveries in the nineteenth and twentieth centuries have contributed to the progress of barbering?

16. How do barber license laws protect both the barber and the public?

17. When and where was the first barber license law passed?

18. When was the barber license law passed in your state?

19. Name the members of your State Board of Barber Examiners.

20. Define the requirements to become a barber in your state?

5268

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

ANSWERS

BLOCK I HISTORY OF BARBERING

1. The earliest records in the form of writings and excavated objects show that barbering was practiced in ancient Egypt and China.

2. The word "Barber" comes from the Latin word "Barba" meaning beard.

3. The custom of wearing beards was a sign of wisdom, strength and manhood and was cherished as being sacred.

4. As early as 400 B.C. in Greece, barbers were a distinct group of artisans. Shaving became a daily procedure in Rome. The common people frequented the barber shops where topics of importance were discussed.

5. In the beginning of the Christian Era, barbers assisted the clergy in the practice of surgery and medicine.

6. Besides doing the regular work of a barber such as shaving, haircutting and hairdressing, the barber-surgeon was permitted to perform surgical operations, do blood-letting and dress wounds.

7. In 1163, Pope Alexander III forbade the clergy to shed blood in surgical operations.

8. The Barbers' Company of London was organized in the thirteenth century to regulate the profession for the benefit of its members. Examinations were given to test the skill of the applicants.

9. Competition and jealousy existed between the Barbers' Guild and the Surgeons' Guild. In 1450, a law was passed uniting the two groups. The law was later enacted, restricted the work of the barber and surgeon to their own fields. In 1745, a bill was passed separating the barbers from the surgeons.

10. A striped pole, having red, white and blue colors, represented the blood, skin and veins involved in blood-letting.

11. In the middle of the thirteenth century, the barber companies of Paris organized the first school of its kind for teaching barbers how to practice surgery.

12. In the year 1745.

13. For over six hundred years.

14. Dutch and Swedish settlers brought with them barber-surgeons to look after the needs of the colonists.

15. The invention of electricity and electrical appliances, better instruments for shaving and cutting hair, and the application of the principles of sanitation and sterilization, have elevated the practice of barbering.

5289

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE:

ANSWERS (Continued)

BLOCK I HISTORY OF BARBERING

16. The passage of barber license laws standardizes the educational requirements for the practice of barbering, thereby eliminating incompetent barbers. As a result, the public is given better service and is protected from the spread of contagious diseases by the enforcement of sanitary and sterilization rules.

17. In 1897, in the State of Minnesota.

18. In 1901.

19.

20. The applicant is above the age of nineteen years, of good moral character, possesses a diploma, certificate or other evidence satisfactory to the Board of Barber Examiner, showing graduation from the eighth grade of grammar school, or its equivalent. The same to be determined by the Board of Barber Examiners. That he is free from any contagious disease.

That he has completed his period of apprenticeship as required by his state license law.

In Connecticut an apprentice starting his apprenticeship must be over the age of sixteen years of age, successfully completed a course of not less than six months of study, both of theory and practice at any barber school or college approved by the Board of Barber Examiners. He will then take an examination for registration as a barber apprentice and continue for not less than two and one-half years as an apprentice under the supervision of a licensed practicing barber in a registered barber shop. During this time he will have to continue his studies on practical and related instruction for a minimum of 144 hours per year as approved by the Connecticut Barbers Joint Apprenticeship Council and the Board of Barbers Examiners.

SUPPLEMENTAL INSTRUCTION MATERIAL

BARBER TRADE
BLOCK I Unit 2

DON'T SELL BARBERS SHORT

The talkative nature of barbers is an old story. It appears in literature, the drama and on vaudeville stages and in that large body of folklore signed by Anon. In it, barbers are philosophers, teachers, political economists and sometimes they are even humorists. That they are not more often humorists is due to the simple fact that no one particularly likes the thought of a Falstaff laughing merrily as he hones a razor for use on the back of the neck. Barbers, in spoken and written literature, generally are Characters, with the modern implication of that easy word, they are the urban counterparts of the cracker-barrel philosophers. Possibly, in this one solitary instance, art follows life. It may easily be that they are teachers, political economists and sometimes even humorists. What is overlooked, however, is that they also form a continuing potential threat to any existing order. The monarchy survives in Great Britain, as the Presidency does here, only by the sufferance of barbers. They should not be taken lightly.

Perhaps so early on an April morning, this may be taken as the creation of windmills for later tilting. It is not. A barbershop is like a newspaper or the radio, a platform for the exchange of public opinion. If, on a given day, all the barbers in America suddenly denounced, say, equality for women, by nightfall all women probably should be back at their original place of serving the table, not eating at it. If all barbers agreed to sponsor a state of anarchy, within a week there would be no enforced laws worth mentioning. The fact that they do not agree shows no more than the proof of the original point, that barbers are like any other commentators - individualists, not units in a machine.

5271

DON'T SELL THE BARBER SHORT (Cont'd)

Democracy in its various minor variations must look carefully under the bed when three separate haircuts, given by three separate barbers, yield a single, unchanged, repeated threat of the same doctrine.

Let the power of the barber be not underestimated simply because the present barber prefers to be an agreeable theorist rather than a rabid teacher. Even one barbershop, centrally located and bleakly in earnest, could conceivable change the course of the human race. If all the barbers in a shop at the Pennsylvania Station suddenly decided that anarchy is the only answer, that doctrine immediately would entrain for Pittsburgh, Williamsport, Chicago, and St. Louis. A cell even more powerful than that at a station could be set up at an airport, for the ramifications would be world-wide. As they chat agreeably about the weather, ladies' hats, the price of pork loins and the prospects of the Dodgers, the barbers may not know just what power is theirs for the asking. Perhaps they do know. Perhaps they wish to change in the status quo to be gradual rather than immediate; they may favor the monarchy and the presidency. On thought, this is the most reasonable explanation.

In its barbershop sketches, vaudeville makes of the barber a thing of fun, the butt of jest. This is not too bright any way it is looked upon, and the answer requires only the question as to where is vaudeville now. Vaudeville has had a haircut, not carefully with shears, but with the razor over all. The barber lingers on, while the actors stand before the Palace, sadly remembering barber jokes which no one seems to wish to hear again. This, no doubt, is justice. This, further, is an indication that the barber must not be sold short, at least not while the hair is growing longer every day. Finally, it is an indication that

DON'T SELL THE BARBER SHORT (Cont'd)

the barber is more than he is pictured, even the normal barber, and not only that theoretical one who is interested in anarchy. The barber has been around for a long time, and this afternoon will not be his last working hour. Pay attention to him, not only because he holds the razor.

The thoughts and the conversation of the barber grow and increase through the day, and that is true of any other student and scholar. The The first client in the morning may bring in no more than the weather, but the second will have a street accident and the third a relevant quotation from Schopenhauer. Human-interest stories follow confidential background material, and that in turn follows casual speculation. As he passes along news and comment, the barber is an editor, winnowing out what seems important from what can be regarded as no more than trivial. A good barber, one experienced in his trade, can soothe and reassure, can also teach and reaffirm, and he is one to deserve the complete attention.

This, he is in a position to demand in any case. He can answer lassitude by the only legal form of hair-pulling allowed in this state. Further, a man sitting down is at a disadvantage in any argument with a standing man, especially if the latter holds the razor. Listen to him.

INSTRUCTOR'S LESSON PLANS

THEORY AND PRACTICE

PRACTICAL AND SCIENTIFIC BARBERING

	Unit	Title
Block II	1	INSTRUMENTS - ACCESSORIES
AIMS:	A	To acquire a trade knowledge of barbering tools and accessories.
	B	To learn how to recognize and care for barbering instruments and accessories.
PREPARATION:		Select and arrange various types of razors, shears, clippers, hones, strops, combs, brushes and latherizers.
PRESENTATION:	A	THEORY LECTURE METHOD 1. Explain why proper implements are necessary for efficient barbering. 2. Name and illustrate the various implements and accessories used in barbering. 3. Explain and illustrate the main parts, types and proper care of razors. 4. Explain and illustrate the main parts, types and care of shears. 5. Explain and illustrate the main parts, types and proper care of clippers. 6. Explain and illustrate the various types of hones and strops. 7. Explain and illustrate the various types of combs, brushes and latherizers. 8. Explain the sanitary requirements in the use of barbering implements and accessories.
APPLICATION:	A	Study textbooks, Lesson I, Pages 24 - 30.
	B	Review with discussion and demonstration.
	C	Review examination questions.
	D	Vocabulary or word study.
TESTS:	A	Examination papers, Lesson I, Chapter I, Pages 2,3.
	B	Manipulation of tools.

INSTRUCTOR'S LESSON PLANS

THEORY AND PRACTICE

PRACTICAL AND SCIENTIFIC BARBERING

	Unit	Title
Block III	1	PRACTICAL SKILLS
AIMS:	A	To understand the basic principles of male haircutting.
	B	To become skilled in the proper use and care of haircutting instrument.
	C	To acquire skill in the cutting and styling of men's hair.
	D	To understand the handling of special problems relating to male haircutting.
PREPARATIONS:	A	Select and arrange necessary supplies - combs, brushes, shears, clippers, etc., for demonstration and practice.
PRESENTATION:	A	THEORY: LECTURE METHOD -- DISCUSSION 1. Explain the importance of the basic principles of male haircutting. 2. Explain the need of studying physiognomy 3. Explain the need of being analytical in contour outline. 4. Give name and description for men's basic haircuts. 5. Give name and description for boy's basic haircuts. 6. Explain the importance of cleanliness in haircutting. 7. Explain the steps and procedure to be followed in giving a haircut. DEMONSTRATION 1. Proper Manipulation and use of haircutting implements a. Show how to hold and use the clipper (hand - electric). b. Show how to hold and use the comb and shears (thinning included). 2. Procedure of Haircutting a. Show how to prepare a patron for a haircut. b. Show how to use the shear and comb (for a natural hairline). c. Show to use clipper on a patron. d. Show how to taper and thin out hair. e. Show how to use the finger and shear work on patron. f. Show how to make the front and side outlines on a patron. g. Show how shave the neck on a patron. h. Show how to finish the haircut.

5275

Block III	Unit 1	Practical Skills (continued)
	B	Demonstration (continued) 3. Special Problems a. Show how to shape eyebrows. b. Show how to trim or cut hair out of ears. c. Show how to trim a mustache.
APPLICATION:	A	Study textbook - Lesson II, Pages 15 - 22.
	B	Study exhibits - Lesson II, Pages 16, 17,18,19,20,21.
	C	Student Practical Performance
	D	Discussion - Orientation - Visual Aid - Review
	E	Student Practice
TEST:	A	Examination papers - Lesson II, Chapter II, Pages 4,5.
	B	Select questions for T and F master list.
	C	Select questions from M.T. master list.
	D	Oral

Block III	2	PRACTICAL SKILLS
AIMS:	A	To understand the basic principles of shaving.
	B	To require the proper technique in face and neck shaving.
	C	To know how to handle the fundamentals and special problems related to good shaving.
PREPARATION:	A	Select and arrange necessary supplies - razors, hones, strops, lather, brushes, towels,etc., for demonstration and practice.
PRESENTATION:	A	THEORY: LECTURE METHOD - DISCUSSION 1. Explain the fundamentals and importance in good shaving. 2. Explain the four most popular positions of holding the razor. 3. Explain and list the necessary steps to prepare the face for shaving. 4. Explain the section of steam towels and lather on the face. 5. Explain the precautions to be observed in shaving the face. 6. Explain the proper method of shaving. Number of steps, etc. 7. Explain the precautions to be observed in shaping the eyebrows and mustaches, the use of styptic powder and removing of blackheads.
	B	DEMONSTRATIONS 1. Honing and Stropping a. Review the use of razor on the hone and strop. 2. Position and strokes of the razor a. Show how to apply and hold the razor in the free hand stroke. b. Show how to apply and hold the razor in the back hand stroke. c. Show how to apply and hold the razor in the reverse free hand stroke. d. Show how to apply and hold the razor in the reverse back hand stroke. 3. Proper Method of Shaving a. Show how to prepare the patron. (1) Arrange chair cloth (2) Recline chair (3) Tuck in towel (4) Hygenic preparation

5277

Block III	Unit	2 PRACTICAL SKILLS (Continued)
PRESENTATION: (Continued)	B	Demonstrations - (Continued) 3. Proper Method of Shaving (continued) (b) Show how to make and apply lather (c) Show how to heat and apply steam towels (d) Demonstrate how to shave the right and the left side of the face (e) Demonstrate how to shave second time over (f) Demonstrate how to finish shaving the face (g) Demonstrate neck shave 4. SPECIAL PROBLEMS RELATED TO GOOD SHAVING (a) Demonstrate how to shape eyebrows (b) Demonstrate how to shape mustache (c) Demonstrate how to apply styptic powder (d) Demonstrate how to remove blackheads from the face.
APPLICATION:	A	Study textbook - Lesson II, Pages 3 - 14
	B	Student Practical Performance
	C	Discussion - Orientation - Review
	D	Student Practice
TEST:	A	Examination papers - Lesson II, Chapter II, Pages 2, 3

PRACTICAL AND SCIENTIFIC BARBERING

	Unit	Title
Block III	4	PRACTICAL MASSAGE
AIMS:	A	To review the principles of anatomy and massage as applied to facial treatments.
	B	To understand the benefits of the plain practical massage.
	C	To acquire skill in giving a practical massage.
PREPARATION:	A	Select and arrange necessary supplies - towels, cleansing cream, vanishing cream, tissue, witch hazel, toilet water, etc., for demonstration and practice.
PRESENTATION:	A	THEORY - LECTURE METHOD - QUESTIONS - ANSWERS METHOD 1. Explain the importance of practical massaging to the practice of barbering. 2. Explain the necessity of being thoroughly familiar with the origin and insertion of the muscles as well as their location. 3. Explain how important it is to also know the location of the nerves, arteries, and the general lymphatic drainage system. 4 Explain and discuss the difference, in giving a strong robust man and a delicate one, a practical massage. 5. Explain and demonstrate the technique of practical massaging involving the muscles of the face and neck. a. Massaging of forehead to remove lines. b. To remove wrinkles at corners of eyes. c. Massaging around eyes. d. To remove wrinkles corner of mouth, chin, etc. e. To improve contour of cheeks. f. To correct flabbiness and double chin. g. To relax the nervous system and restlessness. 6. Explain the sanitary precautions to be observed in giving a practical massage. 7. Explain the physiological effects of movements. 8. Explain what results are obtained by passive movements. 9. Explain the difference between the active and restive movements.

Block III	Unit	4 PRACTICAL MASSAGE (continued)
PRESENTATION (Continued)	B	<u>Demonstrations</u> 1. Movements for practical massage (cleaning or vanishing cream). a. Show how to prepare the patron. b. Show how to apply either cleansing or vanishing cream. c. Show how massage the forehead. d. Show how to massage the regions of the nose and eyes. e. Show how to massage the temples and around the ears. f. Show how to massage the cheeks and chin. g. Show how to massage under the chin and neck. 2. <u>Proper Method to be Applied for Rolling Cream Massage</u> a. Show how to prepare the patron. b. Steam face well with three or four hot towels. c. Apply cold cream, and manipulate thoroughly. d. Apply one or two hot towels to remove excess cream, etc. e. Apply rolling massage cream thinly and spread evenly over face. f. Manipulate the face with rotary and stroking movements with finger tips and continue this operation evenly and with precision all over the face and neck and forehead until cream has been rolled off. g. Apply more cold cream with a few light manipulations, cleanse skin. h. Apply witch hazel steam (plenty of hot towels) i. Apply toilet lotion. j. Dry thoroughly and finish as desired. k. Use dual vibrators if desired.
<u>APPLICATION</u>:	A	Study textbook, Lesson IX, Pages 29 - 39.
	B	Review - Discussion
	C	Student practice of movements.
<u>TEST</u>:	A	Oral
	B	Performance in giving a practical massage.
	C	Thesis on "Benefits of Proper Massaging" (150 words)

Block IV		BACTERIOLOGY
	1	ANTISEPTIC VALUES
AIMS:	A	To understand the use and value of antiseptics in the practicing of barbering. 1. Antiseptics are for use on human body.
PREPARATION:	A	Select two or three antiseptics which can be used safely on the skin, etc., for demonstration, etc.
PRESENTATION:	A	THEORY - LECTURE METHOD - CHART OR TABLE - DISCUSSION 1. Explain the difference between antiseptics and disinfectants. 2. Explain how important the use of antiseptics is in the barbering profession. 3. Name and explain six antiseptics which can be used on the skin without fear of causing irritation or injury. 4. Explain table on antiseptic values.
APPLICATION:	A	Study textbook, Lesson VIII, page 6.
	B	Review - Discussion
TEST:	A	Oral
	B	Select questions from T and F master list.
	C	Thesis on uses and values of antiseptics (100 words).

Block IV	1	FORMULAS - AGENTS
AIMS:	A	To understand the use and application of formulas and agents for external use which can be used in the practicing of barbering.
PREPARATION:	A	Prepare outline of formulas useful to the barber profession.
PRESENTATION:	A	THEORY - LECTURE METHOD - DISCUSSION 1. Explain the importance of selecting the proper formula for each treatment. 2. Explain how careful study is made on specific cases. a. Formula may be too weak. b. Formula may be too strong. c. May be modified to suit the case. 3. Explain how any reputable druggist can put up preparations required for skin and scalp treatments administered by the professional barber. 4. Explain and demonstrate formula to be used for dandruff. a. Mild cases. b. Severe cases. 5. Explain what formula to use for ordinary scalp stimulation. 6. Explain what formula to use for ordinary shedding hair. 7. Explain what formula to use for Alopecia Areats, Eczema, itching scalp, Impetigo of the scalp, Seborrhea Sicca and Oleosa, scaly conditions of the scalp. 8. Explain formula to be used as skin and scalp food ointment. 9. Explain and discuss agents for external use. a. Alcohol b. Boric acid c. Phenol d. Glycerin e. Sulphur f. Mercury g. Oil of cade

SUPPLEMENTAL INSTRUCTION MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

FACIAL FOR OILY SKIN AND BLACKHEADS

1. Prepare patron as usual.
2. Cleanse face well with three hot towels (wrung out from castile soap water).
3. Remove blackheads with the comedone extractor, touching or daubing each spot as it is finished with an astringent.
4. Sponge face well with mild antiseptic, dry.
5. Apply astringent cream followed by placing eye pads over patron's eyes, apply high frequency or infra-red for not more than five minutes.
6. Remove excessive cream and follow by moderate massage manipulations.
7. Steam in an astringent solution (witch hazel), followed by two or three cold towels.
8. Dry and finish as patron desires.

"REMARKS"

To be used for an excessively oily condition of the skin.

Also for oily skin containing numerous blackheads.

Treatments should be repeated weekly. In most cases patron should follow diet.

NOTE: Above procedure can be also used for "Milia Facial."

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

FACIAL FOR ACNE ROSACEA

1. Prepare patron as usual.
2. Cleanse face well with cream, after which it should be gently removed with soft tissues.
3. Bathe face with soda solution.
4. Dry face well and apply astringent cream.
5. Blue light may be used from three to five minutes.
6. Apply warm towel to remove cream.
7. Apply witch hazel, and finish as patron desires.

"REMARKS"

1. This is a difficult case to do much with, other than to give cosmetic relieving treatments.

   a. Patron should consult a physician.
   b. All treatments must be authorized or given under medical supervision.

2. If light is applied, place pads over patron's eyes.

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

FACIAL FOR ACNE VULGARIS

1. Prepare patron as usual.

2. Apply three or four hot towels and see that face and neck are thoroughly cleansed.
   a. A medicated soap may be used in the hot water from which the towels are wrung.

3. Extract comedones with extractor, evacuating pustules that may be in evidence, make sure to apply a good antiseptic lotion immediately upon removal of the comedones.

4. Dry face well and irradiate with ultra-violet for three to six minutes.

5. Bathe face with a good acne germicidal lotion.

6. Apply acne cream and rub lightly in the skin.

7. Place pads over patron's eyes, apply infra-red lamp from seven to fifteen minutes, time to be lengthened with number of treatments.

8. Remove all traces of cream from face with two or three hot towels.

9. Apply a good cool antiseptic lotion.

10. Apply astringent cream.

11. Apply witch hazel, dry, and finish as desired.

12. Use high frequency from seven to ten minutes.

"REMARKS"

Requires continuous care and treatment. Dieting is necessary.

5304

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

TREATMENT FOR OILY HAIR

1. Prepare patron as for usual shampoo.

2. Give scalp massaging manipulations from three to five minutes.

3. Apply tincture of green soap or tar shampoo.

4. Rinse hair well (twice) and dry.

5. Apply ultra violet lamp all over the head from three to five minutes at a target of about 22 inches.
   a. Operator must be guided by the condition of the scalp as to the proper distance.
   b. If scalp is not sensitive, it is advisable to continue scalp massage manipulations for three to five minutes.

6. Apply antiseptic alcohol tonic or desired tonic.

7. Comb hair to suit.

5305

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

TREATMENT FOR DRY SCALP

1. Prepare patron for usual shampoo.

2. Give scalp manipulations from five to ten minutes, massaging all parts of the scalp thoroughly; use either hand or vibrator.

3. Apply with cotton warm olive or castor oil to scalp, parting hair and working it well into the scalp.

4. Allow oil to remain for a few minutes while you may apply infra lamp on it.

5. Give either a soapless oil shampoo or a special egg shampoo. (Operator should be guided by the condition of the scalp.)
   a. Soapless oil for normal condition.
   b. Special egg for irritated condition.

6. Rinse thoroughly and dry well.

7. Apply infra lamp (red) for five minutes at a target of 16 to 20 inches.

8. Finish operation by dressing hair as desired without the addition of any other elements.

"REMARKS"

If scalp is too dry, operator may between 6th and 7th operation, prior to infra red lamp, apply scalp food ointment and follow with infra red lamp.

5306

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

TREATMENT FOR MALNUTRITION OF THE SCALP

1. Prepare patron for usual shampoo with clean linen.

2. Massage scalp very thoroughly with hand or vibrator for about ten minutes, covering every part and moving every inch of the scalp, using a rotary action in your operation.

3. Shampoo scalp with castile soap or any good shampoo which will not dry the hair.

4. Rinse hair well (twice) of all soap matter and dry.

5. Apply ultra violet lamp for three to five minutes at a target of 24 inches. Iradiation is usually divided into four parts: frontalis, two temporals and occipital, in other words, the temples, the front and back of the head.

6. Apply scalp food ointment, rub well into the scalp.

7. Use infra red light on ointment for a few minutes.

8. Dress hair with comb - use no tonics.

"REMARKS"

A. In all cases of malnutrition, the hair presents a very lifeless and dull appearance. Scalp generally dry and covered with flaky dandruff of a white variety. Scalp is also tight or hard to move.

B. Precautions: Protect eyes of patron with colored goggles.
Moistened pads over the eyes.
Operator must wear goggles also.

C. Give these treatments at least once a week.
In some cases twice a week will be necessary.

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

GARLIC RUB RECOMMENDED FOR BALDNESS

Men who are worried about falling hair should cut down on their before-dinner Martinis, rub a little garlic on their noggins and exercise regularly.

This part of the advice proffered by Florence M. Doyle, Scalp Specialist.

"Heavy drinking and dietary excesses of almost any kind are apt to cause a person to lose his hair," Miss Doyle said, "A diet deficiency, on the other hand, also may be responsible for such a condition."

She said if a person expected to keep his hair, he must stay in good physical condition.

"This rule is particularly important for men who live sedentary lives," she said. "I find that the less active a person is the more inclined he is to baldness."

Miss Doyle said the condition of the scalp was even more important than that of the body.

"The scalp must be kept clean at all times," she said. "However, it is not wise to wash the hair more than once every two weeks. Water is bad for the hair and scalp. When washing the hair, use a good shampoo and not ordinary face soap."

To keep the scalp from becoming dry, she advocated the use of olive or castor oil.

"In most cases", she continued, "a man's hairline begins to recede because of lack of stimulation at the roots of the hair. To avoid this, the scalp should be vigorously massaged every day. The use of certain

5308

GARLIC RUB RECOMMENDED FOR BALDNESS (cont'd)

stimulants will help too. One of the best stimulants I know of is garlic. It can be purchased in processed form, completely deodorized."

Miss Doyle said that baldness often was caused by illness, eyestrain, worry, overwork, and hypertension. She said hats, unless they were very tight, did not affect hair growth.

She said baldness is more frequent today than every generation before. It is now common among men in their early 20's, as compared to 30 a generation ago.

Occupation and climate also affect the hairline, she said. She observed that baldness ranked this way among various job holders:

1. Accountants
2. Airplane pilots
3. Musicians
4. Newspapermen
5. Professional athletes.

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

TREATMENT FOR CHILDREN'S HEAD LICE

In the spring of the year many children come home from school scratching their heads - not from what knowledge they gleaned but from head lice they have picked up. When they scratch, the condition is in an advanced stage. Herman Goodman, M. D., dermatologist, suggests this treatment in his book "Your Hair."

"Successful treatment of the patient with head lice requires that all the living parasites be removed from the head; all visible eggs be destroyed; and reinfestation be avoided. Caps and other articles worn or placed in contact with the scalp must be cleaned."

"Lice are removed by fine combing. (Such a comb is sold at drug stores.) They are destroyed by keeping the hair under a cap moistened with equal parts of delphinium (larkspur) and ether, or kerosene and salad oil. Other formulas include mixture of vinegar and alcohol. It is necessary to remove the nits."

The louse attaches the egg to the hair shaft with a cement-like substance. This substance may be softened by either a solution of alkali, such as sodium bicarbonate or borax, or acid, such as warmed household vinegar."

"Patience is required to clear the lice-ridden scalp. A piece of gauze or linen should be soaked in one of the suggested liquids and carefully and deliberately stroked over separate strands of hair until all the hair has been moistened. Stroke should be in the direction from free end and toward the scalp. This direction is necessary because the eggs are attached to the hairs at an angle. If the rubbing is done from the scalp to the free end of the hair, the eggs will probably be passed over without being loosened. Stroking with the saturated cloth effectively removes the eggs.

5310

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

INTERNATIONAL INDIVIDUALIZED HAIR TREATMENT

The success of the treatment is in the uniformity of service and with professional thoroughness. A general procedure is here given; you may substitute whatever ointment or lotion the case may require, but the general application is the same.

1. Wrap clean hair cloth and necessary clean linen carefully around patron's neck.
2. Comb hair gently and note if any sores are visible on the scalp. Study conditions of the scalp and hair, determine treatment most suitable.
3. Massage scalp thoroughly as may be required until it moves loosely over the skull.
4. Carefully cleanse hair and scalp with required shampoo. Rinse out all soap or other shampoo ingredients.
5. Dry hair well with clean towels or electric dryer.
6. Use ultra violet lamp if required, as also may be expedient in the conditions of the scalp and hair.
7. Use whatever ointment the case may require and apply same with fresh new cotton. Oils may be applied the same way.
8. Give a few light scalp manipulations.
9. Use infra red lamp as required.
10. Cover head with clean towel and allow ointment or oil to remain on for about ten minutes.
11. If necessary, shampoo head for second time and dry well.
12. Take fresh piece of cotton and apply astringent, or other ointment or lotion, parting hair in one or two inch sections until the entire scalp is covered.
13. Gently manipulate scalp, massaging preparation well into scalp.
14. Comb hair as desired, using no brush if possible. If brush is used, see to it that it is perfectly sterilized before and after using.
15. Finish treatment as may be desired, and carefully remove hair cloth and other linens.

5311

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

HAIR AS RACE CHARACTERISTICS

1. Dr. Blumenbach stated five different races as to their skin color - black, brown, red, yellow and white

2. Dr. Pritchard grouped them in three classes.
   a. Color of hair and skin not sufficient to determine the character of the race.

3. Dr. G. St. Hilaire classifies all the whites, yellow, brown and red races under straight hair (Leiotrichi), and all negroes, (Negritos) Hottentot, and Bushman under the wooly-haired (Ultrichi).

4. Hair may well be described in general terms as coarse, fine,smooth, straight, curly, waved, frizzy, wooly, crimped or tufted.

5. Seborrhea Oleosa, commonly found among Negroes.
   a. Appears on scalp and face.
   b. Secretion of sebaceous glands.
   c. Acne and comedones are often seen.

6. Seborrhea Sicca cheifly attacks the scalp.
   a. Dandruff accumulates.
   b. Skin and hair become dry.

7. Seborrhea is a functional disorder causing the sebaceous glands to an increased or altered secretion.
   a. Natural sebum consists of fat and the breaking down of cellular tissues so necessary for the oiling of the skin.
   b. Either one of the causes gives the two varieties of Seborrhea (oleosh-sicca).

5312

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK V, UNIT 2

LOCATE SHAVING BRUSHES OF ANTHRAX INFECTED SHIPMENT HEALTH OFFICERS THROUGHOUT STATE SEEKING OTHERS

Anthrax is a severe infectious disease that primarily affects cattle, sheep and other animals. Man may contract the disease by contact with such animals or by handling animal products such as hides, wool and bristles that have come from infected animals.

Recently information was received from the U. S. Public Health Service that shaving brushes of a lot marked "332 Imperial Japan Sterilized" had been found infected with anthrax. The brushes in questions were imported from Japan in October, 1937. While the importer's records did not show that any of them had been sold to wholesalers in Connecticut, the information furnished by the Public Health Service was sent to all health officers in Connecticut by the State Department of Health in a circular letter dated January 30, 1939. On Saturday, February 4, 1939, three brushes "Made in Japan" and bearing the lot number indicated were received in the office of the State Department of Health Officer of Clinton. These brushes were promptly sent to the laboratory for examination for anthrax. From telephone conversation with Doctor Wellman, Health Officer of Clinton, it was learned that the store where the brushes were found had recently changed hands, that the former owner was away and could not be reached at the time in order to ascertain the source of the brushes.

However, since brushes in this infected lot have been found in one Connecticut store, it is possible that they may be found in others. Additional information concerning the matter is contained in a press release sent out for publication January 26, 1939, by the New York City Department of Health after conference with Public Health Service officials which reads in part as follows:

> "Recently a case of anthrax in North Dakota was traced to a Japanese shaving brush. In the study of this case anthrax bacilli was found on a number of similar shaving brushes from the same lot both in the laboratory of the National Institute of Health at Washington and in the laboratory of the New York City Department of Health.
>
> The brushes were imported from Japan in 1937 and distributed from New York, the shipments, so far as the present investigation has gone, being made to points outside of the city. Steps are now being taken by the United States Public Health Service in cooperation with state and local health authorities to recover those still in the hands of wholesale and retail dealers.
>
> "In New York City there have been no cases of anthrax since 1936 and no cases traceable to infected shaving brushes since 1925. Nevertheless, the Department of Health believes it advisable to call attention to this particular lot of Japenese shaving brushes, inasmuch as it is possible that there may be some of these brushes in the hands of dealers or users in New York City.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

BARBER TRADE

BLOCK V, UNIT 2

Anthrax Infected Brushes (continued)

> "The brushes are of a cheap variety - small in size, 4½ inches over all, the handles, 3/4 inch in diameter, painted in two colors. On top they are stamped 'Japan 332', and on the side they bear the words 'Imperial - sterilized', the latter in small letters. The brush is of stiff hair, grayish in color, or mixed black and white."

If any additional brushes bearing the lot number in question are found anywhere in Connecticut, it will be greatly appreciated if notice is sent to the State Department of Health at once. Better still, it would save time and trouble in investigations if the brushes were shipped in and information furnished with reference to their origin. Such information would facilitate further checkup on the distribution of the lot of infected brushes.

Incidentally, the only case of anthrax traced to a shaving brush during recent years in Connecticut occurred in 1932. A man gave his own brush to his son and began using an old brush he had found somewhere and in a few days he came down with anthrax which was fatal. Presumbaly, the old brush was one that was distributed during or shortly after the World War when a number of shaving brushes were found to be infected with anthrax.

	6	BLOOD VASCULAR CIRCULATORY SYSTEM (ANGIOLOGY)
		A. VEINS OF HEAD, FACE AND NECK B. ARTERIES C. PRINCIPAL ARTERIES AND VEINS
AIMS:	A	To understand the structure and functions of the blood vascular system.
	B	To understand how the blood and lymph circulate through the body.
	C	To know the blood supply to the face and scalp.
	D	To appreciate how important the knowledge of the blood vascular system is to the average barber.
PREPARATION:	A	Display wall and loose leaf charts of the heart and blood circulation to the head, face and neck.
	B	Procure movie on "The Heart and Circulation", Code #EF-27.
PRESENTATION:	A	THEORY-LECTURE METHOD-VISUAL AID-QUESTION-ANSWER 1. Explain what the blood vascular system consists of. 2. Name and describe the two main branches of the blood vascular system. 3. Give a description of the location and activities of the heart and blood vessels. 4. Distinguish between arteries, veins and capillaries. 5. Explain the vital functions of the blood. a. Weight b. Appearance through microscopic examination. c. Types of corpuscles and their function. 6. Trace the circulation of the blood from and to the heart. 7. Name and locate the main blood vessels found in the head and face. 8. Name the parts of the head and face supplied by these blood vessels. 9. Trace the flow of blood from the head and face to and from the heart. 10. Emphasize the importance of understanding the blood vascular system.

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE
BLOCK V, UNIT 7

NEW MEDICAL INTEREST IN VITAMIN E

Physicians have renewed interest in the elusive vitamin E, and they feel that many of us lack sufficient of the valuable vitamin in our diets.

It is considered that vitamin E plays an important chemical role in aiding the body to take nourishment from all the other vitamins. It has been proven that this vitamin is essential to normal reproduction, normal growth and the proper functioning of the pituitary gland. When young animals are denied vitamin E they get partial paralysis and do not reproduce.

Vitamin E comes from 100 per cent whole grains (which most menus lack), but it may be gotten from other foods such as fresh wheat germ, avacado oil, corn oil, sesame seed oil, soya bean oil, peanut oil, lettuce, tomatoes, carrots, egg yolks and nuts.

As you glance through that list, including whole grains, you undoubtedly are aware that you do not eat many of these foods, at least in any quantity. If that is the case you are perhaps in need of vitamin E and should plan to include one of those foods in your daily diet.

Women depend upon vitamin E for beauty and for your reproduction. The consensus of medical opinion is that if a pregnant mother has sufficient vitamin E there is little danger of a miscarriage or a premature birth. Other ailments such as diabetes and partial paralysis are being treated with concentrated doses of vitamin E.

Whole grains are: cornmeal, steel-cut oatmeal, all-bran, barley,wild rice, wheat germ, whole wheat, corn.

If we are told to eat these foods to keep us normal, healthy and beautiful, why not eat them?

Acne cannot be wished away! It can be overcome.

SUPPLEMENTAL INSTRUCTIONAL MATERIAL

BARBER TRADE

BLOCK VI, UNIT 1

FORMULAE TO DESTROY LICE AND NITS

Bichloride	4 grains
Acetic Acid	½ ounce
Water	8 ounces

TREATMENT

1. Prepare patron as for the usual shampoo.
2. Sponge small portion of the hair at a time until entire head has been covered.
3. Prepare carbolic acid solution - 1 in 40 parts of water.
4. Sponge all parts of hair to destroy nits. To neutralize carbolic acid, use alcohol.

"REMARKS"

Another home remedy to destroy parasites is:

1. To brew quassia bark or chips.
2. Use liquid freely over the head.

Block III, Units 1 & 2 BARBER TRADE

SHAVING AND HAIRCUTTING

Name_____Class_____Date_____

1. The width of the razor should be about 5/8 of an inch..... T F

2. Steel razors are more durable than silverplated ones..... T F

3. A razor is never used for thinning or tapering the hair..... T F

4. A razor has a perfect edge when its teeth are very fine..... T F

5. A rotary movement is best in lathering the beard..... T F

6. Before shaving, use hot towels on a sensitive or chapped face..... T F

7. Ingrown hair is caused by close shaving..... T F

8. Eliminating any chance of halitosis, a good hygenic precaution..... T F

9. In shaving, the only strokes used are: 1. The free hand, and 2. back hand..... T F

10. Lather does not necessarily have to be wiped from the blade..... T F

11. Freedom of the wrist is paramount in all strokes for good shaving..... T F

12. Dry beard hairs will dull the razor..... T F

13. A hot towel must contain an abundance of hot water to be applied efficiently..... T F

14. A close shave removes the epithelium and furnishes a breeding ground for bacteria..... T F

15. To be an artist in hair cutting, the barber must study physiognomy..... T F

16. Hair cutting is classified in seven different styles..... T F

17. The basic service rendered in a barber shop is haircutting..... T F

18. Concern as to the tapering is immaterial in good haircutting..... T F

19. The natural hair-line is found on the top of the patron's head..... T F

20. The higher the clipper-work proceeds, the better the haircut will fit the contours of the patron's head..... T F

21. The still blade of the shears should always ride on the bottom of the fine teeth of comb..... T F

SHAVING AND HAIRCUTTING (CONT'D)

22. Clipper-lines and shear-ridges should be noticeable after the haircut is completed.....T F

23. The use of the thinning shears on fine hair is not warranted.....T F

24. The best method of giving a pompadour is to use the clipper exclusively T F

25. The neck shave must follow the natural hair line.....T F

26. The hair part should be diagonal to the ears.....T F

27. The art of hair cutting is not easily acquired.....T F

28. The importance of hair is mainly personal adornment.....T F

29. The haircutting cloth should be wrapped on the outside of the back of the barber chair.....T F

30. More men than women cut their hair.....T F

INTEGUMENTARY

Block V, Unit 2 SKIN, SCALP AND THE APPENDAGES BARBER TRADE

Name_____Class_____Date_____

1. Respiration causes the skin cells to take in some oxygen and to emit some carbon dioxide..... T F

2. Skin does not have to be cleansed; it performs this action itself..... T F

3. Alkali and soap removes natural oil from the skin, leaving it dry and rough..... T F

4. Epidermis, scarf skin, epithelial tissue and epithelium are the same.... T F

5. The Mapigian Layer is the pitment layer of the skin..... T F

6. Dermatitis is the second layer of the skin..... T F

7. The skin protects from the invasion of bacteria..... T F

8. The tendency to take in oily substances and reject watery ones is called Absorption..... T F

9. The Epidermis has three layers of fatty tissue..... T F

10. There are no blood vessels in the epithelial tissue..... T F

11. The Papillary and the Reticular are the two layers of the Derma..... T F

12. Skin is 1/2 inch thick..... T F

13. The skin is a good conducter of heat..... T F

14. A person's skin is always darker around the eyes, nipples and armpits T F

15. The aubcutaneous layer of the skin is the true skin..... T F

16. Corium derma and the true skin are the same..... T F

17. Sebum cools the skin..... T F

18. When the blood supply is cut off, the growth of hair stops..... T F

19. There are more hairs than follicles..... T F

20. The life of an eyelash is from four to five months..... T F

21. Sebum is a semi-liquid substance consisting of oil mixed with water, dead epithelial cells, and other waste matters such as fats, fatty acids and salts..... T F

22. Trichology is the scientific study of hair.....T F

23. The root of the hair is the part of the hair that lies within the follicle.....T F

24. The arrector muscle of the hair follicle and application of heat and electrical impulse activates the sebaceous gland.....T F

25. The three layers of the hair are: The cuticle, the derma and the medulla.....T F

26. The coarse hair within the ears and nostrils is called bristles.....T F

27. It takes from 41 to 72 days for the hair to grow from the papilla to the surface of the scalp.....T F

28. The skin is the seat of the organ of touch.....T F

29. Keratin is the horny substance of which hair is made.....T F

30. After a hair has fallen out, a new hair will appear in about ten daysT F

31. Hair has blood vessels.....T F

32. The average life of hair is from two to four years.....T F

33. The arrector muscle of the hair is an involuntary muscle.....T F

34. An old hair is not entirely out of the hair follicle before a new one has begun to form and to grow in its place.....T F

35. Hair is hygroscopic; not porous in the usual sense but it does absorb moisture.....T F

36. Sebaceous glands are sweat glands.....T F

37. Perspiration is acidic.....T F

38. Anidrosis is excessive sweating.....T F

39. Hyperidrosis is the term used for the lack of sweating.....T F

40. When the hair is pulled out by the roots, hair growth is destroyed..T F

41. Textures of hair are classified by size.....T F

42. Melanin is both the hair and skin pigment.....T F

43. The matrix or nail bed is the portion directly beneath the body of the nail and has an abundant supply of blood vessels and nerves.....T F

44. Average nails grow about 1/8 of an inch per month.....T F

45. Nerve endings are exposed through the epidermis.....T F

11. ..... is a water soluble salt consisting of fatty acid in combination with sodium or potassium..... ( )

12. Alcohol, in weak....., is cooling and antiseptic..... ( )

13. An.....solution is one in which the solvent is water..... ( )

14. .....cannot be created or destroyed..... ( )

15. .....is the building up of a compound..... ( )

16. .....chemistry treats of substances derived from the animal and vegetable kingdom..... ( )

17. Boiling means heating to a temperature of 212° ..... ( )

18. Creams are mainly.....of different kinds mixed in different proportions with water..... ( )

19. An.....agent is one which allows oil and water to mix..... ( )

20. Soaps are harmless to the skin if they do not contain free..... ( )

21. Phenol and mercury bichloride are two disinfectants which are..... to metals..... ( )

22. An alkaline solution will turn red.....paper blue..... ( )

23. The temperature of boiling water is 100° ..... ( )

24. .....can be defined as a chemical change taking place when an acid is added to a base of alkali..... ( )

25. About 65% of the.....is composed of water..... ( )

26. Alcohol is obtained by the.....of certain sugars..... ( )

27. Formaldehyde gas is rendered inactive by the addition of..... ( )

28. .....stains are readily removed with alcohol..... ( )

29. Do not use.....soap on the face..... ( )

30. Cocoa butter or.....are ingredients of a superfatted soap..... ( )

TRADE THEORY TEST

Block VI, BARBER TRADE

ELEMENTARY CHEMISTRY

Name_____ Class_____ DATE_____

1. Chemistry is the science that treats of the composition of matter....T F

2. Matter is anything that occupies space and has weight.....T F

3. Energy is the activity, power or force found in matter.....T F

4. Pharmacology is the science that treats of drugs and their relations.T F

5. There are five states of matter, three of them being solid, gas and liquid.....T F

6. An element is the simplest form in which matter exists.....T F

7. An Atom is the smallest particle of an element.....T F

8. Molecules are combinations of similar atoms.....T F

9. Compounds are various molecules existing together in fixed relations..T F

10. The principal types of compounds are: acids, bases and salts.....T F

11. An acid is a compound having electronegative properties and reacts with bases to form salts.....T F

12. A base, better known as an alkali, is a compound having an electrositive reaction. It unites with acids to form salts and with fats to form soap .....T F

13. A salt is a compound usually containing a positive metal atom.....T F

14. A chemical change takes place where a substance does not change its atomic structure.....T F

15. A physical change is one that takes place when a substance is altered in its chemical nature.....T F

16. Hard water, such as rain or distilled water, contains practically no minerals.....T F

17. Soft water contains a small amount of mineral salts.....T F

18. Glycerine is a thick, colorless, syrupy liquid obtained from the (also is an alcohol) hydrolysis (process of decomposition involving the addition of water) of fixed fats.....T F

19. Soap is a water soluble salt consisting of fatty acid in combination with sodium or potassium.....T F

20. Alcohol, in weak concentration, is cooling and antiseptic.....T F

21. An aqueous solution is one in which the solvent is alcohol.....T F

22. A tincture is a solution in which the solvent is water.....T F

23. Matter may be created or destroyed.....T F

24. The Chemical symbol for water is H_2O_2.....T F

25. Synthesis is the building up of a compound.....T F

26. Energy cannot be created or destroyed.....T F

27. Organic chemistry treats with substance found generally in mineral derivation.....T F

28. Inorganic chemistry treats of substances derivedfrom the animal and vegetable kingdom.....T F

29. Boiling means heating to a temperature of 212° Fahrenheit to destroy microbes and drive off gases.....T F

30. Creams are mainly oil of different kinds mixed in different proportions with water.....T F

31. An Emulsifying agent is one which allows oil and water to mix.....T F

32. A water-in-oil (w/o) cream is the most ideal for a cleansing agent because it tends to melt at body temperature and spreads readily over the skin (cold cream).....T F

33. After the cleansing cream is removed, the skin should feel smooth not sticky or greasy, perfectly clean and relaxed.....T F

34. Soaps are harmless to the skin if they do not contain free alkali..T F

35. Vanishing cream is an oil—in—water (o/w) emulsion containing as high as 75% water.....T F

36. Phenol and mercury bichloride are two disinfectants which are corrosive to metals.....T F

37. Formalin, Phenol, mercury bichloride and cresol when used as disinfectants should be labeled POISON.....T F

38. The temperature of boiling water is 100 degrees Centigrade, and 212 degrees Fahrenheit.....T F

39. Neutralization can be defined as a chemical change taking place when an acid is added to a base or alkali..... T F

40. An acid solution will turn blue litmus paper red..... T F

41. An alkaline solution will turn red litmus paper blue..... T F

42. Potassium hydroxide, as a base, is used in the manufacture of soap..T F

43. The addition of a base to an acid results in the formation of water and a salt ..... T F

44. Hard water may be softened by boiling, distillation or adding borax... T F

45. About 65% of the human body is composed of water..... T F

46. Alcohol is obtained by the fermentation of certain sugars..... T F

47. Formaldehyde gas is rendered inactive by the addition of ammonia..... T F

48. Iodine stains are readily removed with alcohol..... T F

49. Emulsions are permanent mixtures of oil and water combined with the aid of gums or soaps..... T F

50. Creams differ from ointments and pastes in the large amount of water they contain..... T F

51. Do not use naptha soap on the face..... T F

52. Lanolin or cocoa butter are ingredients of a superfatted soap..... T F

53. The use of ammoniated mercury as a bleaching agent is harmful to the skin..... T F

54. Benzine and gasoline are used in dry shampoos..... T F

55. Shampoos are dilute solutions of soap in water..... T F

56. Hand lotions are dilute emulsions of steric acid and water..... T F

APPENDIX

A student course, to be effective and to conserve time for both the student and the Instructor, must utilize supplementary aids which contribute to the development of each individual. Accordingly, current materials are grouped in this bibliography as (A) Texts and workbooks required by each student, (B) Reference texts, and handbooks for class use, and (C) manufacturers' and organizations' trade literature.

CHART "A" TEXTS AND WORKBOOKS (One Copy required for each student)

Instructor's Manual. Preparatory Course for the Barber Trade, Parts I and II.

Connecticut State Dept. of Education, Hartford. Div. of Vocational Education.
MF AVAILABLE IN VT-ERIC SET.
PUB DATE - 63 69p.

DESCRIPTORS - *TRADE AND INDUSTRIAL EDUCATION; *TEACHING GUIDES; *BARBERS; *MANUALS; VOCATIONAL EDUCATION; ADULT EDUCATION PROGRAMS; *SERVICE OCCUPATIONS; LESSON PLANS; SKILL DEVELOPMENT

ABSTRACT - Prepared by the Division of Vocational Education of the Connecticut State Department of Education, this manual is part of a 3-part series and was assembled for use by instructors in presenting material and motivating students interested in the barber trade. Part I provides the trade and related outlines for the course, including estimated hours of instruction, trade theory and practice, social studies, English, and mathematics, while Part II consists of a weekly schedule for trade and related instruction which correlates the trade theory and related instruction. Each part contains several blocks, and the entire course is arranged for 1,300 hours. Parts III and IV are available as VT 012 610 and VT 012 611, also in this issue. (GEB)

TO THE INSTRUCTOR:

This manual has been assembled for use by instructors in the Barber Trade. The content was prepared after the need for developing highly skilled and efficient practitioners in the Barber Trade was recognized. Students learning the Barber Trade are given actual and pertinent information and instruction governing trade and related subjects.

The Instructor's Manual should aid the instructor in motivating and encouraging the student to grasp every opportunity to gain and expand his knowledge, to develop and improve his skill, and to realize the opportunities that lie ahead in the security of his future life's work. The training creates within the student justified pride in the knowledge acquired.

This manual is divided into four major parts. Part One covers all the trade and related outlines for the course, such as, estimated hours for trade and related instruction, trade theory and practice, social studies, English salesmanship, and mathematics for Barbers.

Part Two consists of a weekly schedule for trade and related instruction whereby trade theory and shop practices, mathematics, social studies, English and Salesmanship are applied and correlated for the Barber Trade.

Part Three deals with the teaching plans for trade theory. It consists of seven blocks of instructional materials built around the textbook, reference texts, illustrations and supplemental material.

The trade theory tests included in Part Four are correlated with the teaching plans in Part Three.

The four parts of the manual are arranged in a natural sequence of teaching-learning difficulty. Use of the manual will improve the effectiveness of instruction to the potential Barber craftsman.

PREPARATORY COURSE
FOR THE
BARBER TRADE

TRADE AND RELATED INSTRUCTION

1. The instruction identified in this section covers pre-apprenticeship training as required under Public Act #308 (an act concerning Barbers) and is intended to prepare the student for an apprentice license. A majority of the time has been apportioned to practical training for two reasons.

   a. A student must develop basic skills to a considerable extent before he may enter a barber shop as an apprentice and perform work upon regular customers.

   b. The student may have an opportunity to complete technical and related training during his on-the-job training since annual renewal of his apprentice license requires that he attend classes for this type of instruction a minimum of 144 hours each year.

   The course has been set up to include a full year (school) of approximately 1300 hours, 300 hours beyond the minimum required by law, in order that the course may be coordinated with the Vocational Technical School Program.

2. The time allotment shall be for one school year and will provide:

   a. The related technical knowledge of the barber trade.
   b. The basic skills of the trade - to provide sufficient knowledge to continue as a barber apprentice.
   c. General trade information necessary for basic understanding of trade processes.
   d. Trade calculations and mathematics.
   e. Trade hazards and safety.

ONE SCHOOL YEAR

Trade Theory		200 hours
Practical Work		950 hours
General Trade Information		110 hours
Applied Mathematics		40 hours
	Total	1300 hours

3. Experience has shown that one school year is reasonably adequate for basic training in this area.

ABSTRACT - To assist in organizing and conducting manpower development, training, and retraining programs, this individually authored guide and resource manual provides a course outline for 60 hours of instruction in numerically controlled machine tools programing and operation. Course units are: (1) Introduction to Numerical Control, (2) Blueprint Interpretation, (3) Machining Methodology, (4) Holding Devices, (5) Programing 1 and 2: Two Axis, (6) Tape, (7) Test the Program, (8) Basic Electricity, (9) Hydraulics, (10) Basic Electronics Devices, (11) Control Systems, (12) Auxilliary Functions, (13) Programing 1, 2 and 3: Three Axis, (14) Programing a Slope, (15) Programing an Arc or Circle, (16) Test the Programs, and (17) Computer Assistance. A bibliography and a listing of 21 films are included, and an instructor's lesson plan, floor plans, equipment lists, and teaching tips are appended. (GB)

FOREWORD

Employment opportunities for trained operators of numerically controlled machine tools are expected to be very favorable in the foreseeable future. The accelerated shift toward automation in manufacturing is expected to raise the employment level in the number of workers operating numerically controlled machine tools. Industries manufacturing short run items are already finding it increasingly difficult to secure trained manpower.

This guide provides a course outline for 60 hours of instruction in numerically controlled machine tools programing and operation. This combination course guide and resource manual should be of assistance in organizing and conducting manpower development, training, and retaining programs.

Equipment for carrying out training programs in this field is expensive; therefore, the assistance of local advisory groups should be sought in selecting items that will best serve local needs. The suggested lists included in the guide covering equipment, supplies, and teaching aids are a helpful starting point in discussions with local representative advisory committees and employers.

This guide was developed under the direction of Norman Mitby, Director, Madison Vocational, Technical, and Adult Schools (Madison, Wisconsin) for the Division of Manpower Development and Training and the Division of Vocational and Technical Education. The course material was prepared by Alun C. Thomas, Assistant Supervisor, School of Vocational Trade and Technical Education, of the Madison School.

HOWARD A. MATTHEWS
Director, Division of Manpower Development and Training

LEON P. MINEAR
Director, Division of Vocational and Technical Education

ARTHUR LEE HARDWICK
Associate Commissioner for Adult, Vocational, and Technical Education

ACKNOWLEDGMENTS

The U.S. Office of Education recognizes the valuable contributions made in the preliminary and final review of this publication by the following men in the field of numerical control, who are members of industrial organizations and technical societies and leaders in the field of technical education:

Robert Bachmann, Training Administrator, Kearney & Trecker Corp., West Allis, Wis.
Elek D. Csont, Numerical Control Coordinator, Seneca Vocational High School, Buffalo, N.Y.
Norman Everson, Senior Programer, Gisholt Machine Corp., Madison, Wis.
James W. Gibson, Assistant Manager, Sales Engineering, Colt Industries, Inc., Pratt & Whitney, Inc., Machine Tool Division, West Hartford, Conn.
John B. Hemker, Applications Engineer, Square D Co., Milwaukee, Wis.
William H. Jorgensen, Chief Engineer, Cleereman Machine Tool Corp., Green Bay, Wis.
Walter Kramer, Industrial Engineer, Beloit Corp., Beloit, Wis.
John R. Plenke, Vocational, Technical Education Administrator, State Board of Vocational and Adult Education, Madison, Wis.
Lester Radtke, Training Director, Giddings and Lewis Machine Tool Co., Fond du Lac, Wis.
Richard A. Schmidt, Machine Shop Coordinator, Fond du Lac Vocational, Technical & Adult School, Fond du Lac, Wis.
Donald H. Stevens, Industrial Engineer, Allis Chalmers Manufacturing Corp., West Allis, Wis.
Philip Stoll, Curriculum Coordinator, Fond du Lac Vocational, Technical & Adult School, Fond du Lac, Wis.
Gerald Subling, Senior Programmer, Giddings and Lewis Machine Tool Co., Fond du Lac, Wis.
Herbert L. Wright, Coordinator of Training, Cincinnati Milling & Grinding Machines, Inc., Cincinnati, Ohio

The Office of Educaton also acknowledges with appreciation constructive criticism by administrators and staff members of the following institutions and industrial organizations.

The Boeing Co., Renton, Wash.
DeKalb Area Vocational School, Clarkston, Ga.
Ford Motor Co., Dearborn, Mich.
General Electric Co., Pittsfield, Mass.
International Association of Machinists and Aerospace Workers, Washington, D.C.
International Business Machines Corp., Raleigh, N. C.
Lockheed-Georgia Co., Marietta, Ga.
Macomb County Community College, Warren, Mich.

PURPOSE OF THE COURSE GUIDE

This course guide has been prepared to assist in planning and developing a course for training and retraining workers in the machine tool area which pertains to the application of numerical controls—point-to-point positioning. The guide has been organized to suggest the basic principles necessary as a background for selecting the content for a numerical controls course. It will be of use to manpower training directors in industry or school administrators who are interested in offering this course in their communities. Sufficient details have been included to provide assistance for an instructor to develop and operate an efficient manpower development and training program.

In addition to serving as a guide to manual manuscript programing of machine tools, it can also serve as a guide for the training of personnel in such fields as graphic arts, welding, and tube bending, where numerical controls are being applied. The course developed in this guide may be used as a prerequisite to contour programing or continuous path programing. Much of the related material included in this manual has been added specifically for the purpose of encouraging the trainee to progress beyond the entry level.

No attempt has been made to cover the entire series of numerical control systems or procedures. The suggested course outline and the suggested resource materials require adaptation to the specific objectives of the personnel to be trained and the system, or systems, of numerical controls to be used. The selection of topics, the sequence and methods of presentation, the laboratory hardware, and the final planning should be determined by instructional specialists, depending upon the needs and background of the trainee group. Supplementary materials such as textbooks, references, manufacturers' bulletins and manuals, catalogs, and films are listed for the instructor's convenience. The references and films cited at the end of unit outlines are given in greater detail in the bibliography or the list of films near the end of this publication.

5457

OCCUPATIONAL INFORMATION

*Tape Control Machine Operator (mach. shop) 609.782**

Numerical Control Machine Operator

Sets up and operates magnetic or punched tape controlled machine tools that automatically mill, drill, broach, and ream metal parts. Bolts fixture to machine bed, using wrench. Positions metal stock on fixture according to program directions, using rule and calipers, and secures it, using clamps or bolts. Assembles cutting tools in tool holders and positions tools in machine spindles according to directions, using calipers and hand tools, or inserts cutting tools in specified machine magazines. Places control tape in reading magazine and hooks tape at beginning point over reading mechanism. Turns dial to index cutting tool to specified set point, turns switches to operating position, and starts machine. Changes cutting tools and location of clamps, and repositions metal stock on fixture as directed by program instructions. Observes machine operation and verifies accuracy of machining against blueprints or engineering drawings by measuring cuts with micrometers, dial indicators, and gages. Notifies supervisor of discrepancies. May adjust machine feed and speed and change cutters to machine parts according to specifications when automatic programing is faulty or if machine malfunctions.

*Drill Press Operator, Tape Control (mach. shop) 606.782**

Tape Control Drill Press Operator

Sets up and operates tape controlled, turret type drill press that automatically positions indexing table, selects tool, and drills, reams, and taps metal castings. Installs holding fixture on indexing table of machine and control tape in reader at zero point indicated on process diagram. Locks drilling, reaming, and tapping tools in turret in sequence specified on process sheet. Positions casting in holding fixture and starts machine to perform trial run. Stops machine at each tool and table position during trial run and verifies diameter and depth of cut, using specified fixed gages. Turns screw on turret indexing head to adjust depth of cut. Notifies supervisor when hole diameters do not conform to specifications. Positions new casting in fixture and starts machine which automatically positions indexing table, selects tools, and machines casting through predetermined code punched in control tape. Verifies dimensions of holes, using fixed gages and following diagram of casting.

*Jig Borer, Tape Control (mach. shop) 606.782**

Tape Control Jig Borer

Sets up and operates tape controlled, single spindle jig borer to face, drill, ream, and tap metal castings. Positions holding fixture on indexing table and adjusts clamps of fixture to secure casting in position specified on process sheet. Pushes button to zero indexing table and console at established locating point. Positions control tape in reader at zero point and starts machine which automatically positions indexing table through predetermined code punched in tape. Calculates travel of cutting tool required to touch top of casting and selects precision blocks which equal that distance. Places blocks under dial indicator to set machine for depth of cut. Turns handwheel to lower cutting tool and dial indicator. Stops wheel when needle on dial indicates cutting tool has machined casting to specified depth. Presses buttons to record dimension on console for subsequent automatic machine process and to advance tape. Verifies dimension of holes, using specified gages.

*Multipurpose Machine Operator, Tape Control (mach. shop) 609.782**

Tape Control Multipurpose Machine Operator

Sets up and operates tape controlled machine that reams, mills, taps, drills, and bores metal castings. Fastens casting in holding fixture at position indicated on process sheet, using wrenches. Inserts spec-

5458

ified preset cutting tools in rotary tool magazine. Positions control tape in machine at zero position indicated on tape. Pushes button to start machine that automatically positions indexing table and toolholder, selects tool, and machines part through predetermined code punched in tape. Stops machine after each machining operation on initial casting and verifies dimensions, using specified fixed gages. Turns screw on boring tool to adjust diameter of cut to size of gage. Notifies supervisor if other machining processes do not conform to specifications. Verifies hole dimensions of all castings processed, using fixed gages and following diagrams of castings. May be designated according to name for machine operated as MILWAUKEE-MATIC operator.

2460

EMPLOYMENT OPPORTUNITIES

The sales of numerically controlled machine tools doubled between 1963 and 1965. It is estimated that 10,000 numerically controlled machine tools are in operation today. New applications for numerical control (N/C) and other forms of automation are being found constantly. Men must be trained or retrained in order to supply the programers and N/C machine operators required to utilize these machine tools effectively.

As the number of numerically controlled units increases and older conventional machine tools are replaced, the demand for N/C programers and operators continues to rise. With the implementation of the "autofacturing"[1] concept in the future, employment appears even better.

5460

TRAINEE QUALIFICATIONS

The trainee should have a good basic background in machine tool work. More specifically, the background in blueprint interpretation, machining methods, holding procedures, operational sequencing, and mathematical calculations should be of such competence that only a short review will be necessary before starting the programing procedure. If the trainee does not possess this background, separate courses involving considerably more time may be necessary.

It may be desirable to set up specific prerequisites for all trainees, such as a period of machine operation, formal preparation of a machine shop program, or a testing program. An example of a testing program as recommended by one survey was the U. S. Employment Service Specific Aptitude Test Battery B359.

Whatever method or methods are used in the selection of trainees, it is of prime importance that the materials presented be adjusted to the needs of the group and the objectives of the course.

5461

ORGANIZING AND TEACHING THE COURSE

Teacher Qualifications

A teacher for this course must have a thorough knowledge of the skills involved in machine shop procedures along with experience in the operation and programing of at least one machine. His knowledge should include interpretation of the blueprint of the machined part, metal removal processes, machine(s) functions, nomenclature, and programing procedure.

The instructor should have the ability to work with people, organize instructional materials, present the materials, and evaluate the results.

Since several disciplines are presented, it is quite possible that several persons may be needed to teach this course. In that case, the efforts of all teachers must be coordinated so that the total instruction meets the objectives of the course.

If the person selected for this teaching assignment has had no teaching experience, he should be instructed in the necessary teaching fundamentals, such as lesson planning, teaching methods, and course construction.[2]

Organizing the Instruction

The instruction should be organized to meet the course objectives. If the main objective is to produce a programer for a specific machine tool system, then each lesson should be prepared to meet this objective. Each of the lessons should have objectives and procedures for instruction and evaluation so that the objectives will be attained. The instructor must use instructional materials to motivate the student to realize his maximum potential.

Each lesson is organized so that it integrates with or leads into the next lesson and contributes toward the course objective. The instructor must evaluate each student to insure that the student is progressing toward the course objective(s).

Planning the Lesson

Presentations should be well planned. Identify the topic to be covered and the objectives to be attained.

Identify the lesson by number and sequence. Select a descriptive and understandable title. Set a realistic goal concerning the time necessary to cover the material well. Too little time is frustrating, while too much is boring. The time element is closely associated with the background of the student. The lesson objectives should be stated and interpreted by each student so that they become his objectives. Choose realistic objectives which allow you to see later how successful you were in realizing them.

The equipment and materials necessary for each lesson are selected to attain the objectives. They should be prepared, available, in good working order, and accessible so they blend into a smooth presentation. Delays and insufficient equipment or materials lead to poor rapport with the students.

Teaching aids are simply an extension of the communication process. Visual aids large enough to be visible to all will enhance the instruction. Maximum use should be made of such teaching aids as chalkboard, charts, strip films, films, mockups, cutaways, and an overhead projector in presenting the lesson.

References should be identified, listed, and made available for the student's use. The practice of locating and using ready-reference materials and knowing how to attain references on one's own encourages the student to continue to search and learn outside of a formal class situation. Public libraries, company libraries, periodicals, bulletins, and professional groups all help the student keep abreast of the technology.

Written plans may be brief. The instructor will know the following:

1. The goals or objectives of the lesson—the kind of learning desired
2. The outline and suggested time schedule for the lesson, including:
   a. An interesting approach—a way to introduce the lesson, to capture the interest of the trainees, and to direct their attention

[2] *The Preparation of Occupational Instructors.* Superintendent of Documents, Catalog No. FS 5.280:80042. Washington, D.C.: U. S. Government Printing Office. Price $1.25.

5461

5462

to the lesson's goals or objectives

b. Activities which involve the trainees in discovering and applying new facts and principles

c. A way to summarize the lesson—to help the trainees arrive at some valid conclusions and/or evaluate the extent to which lesson goals have been achieved.

3. The facts and principles or main ideas to be brought out in the lesson
4. The teaching materials and references to be used

Criteria for Evaluating the Training

The criteria which serve as a guide in determining whether the trainee is ready for employment as a programer or N/C machine tool operator may not be as clearly defined as in some other occupations. Therefore, it is very important that every attempt should be made to properly evaluate the trainee's progress.

The use of various evaluative devices is necessary for the instructor and the trainee to accumulate objective information pertinent to the growth of the trainee. Competencies of the following kinds are important to develop during the training program:

A. Activities showing understanding, knowledge, and skills:
   1. Understands and conforms to directions
   2. Demonstrates ability to work with minimum supervision
   3. Demonstrates ability to develop and follow a work plan or schedule
   4. Demonstrates effective time utilization
   5. Demonstrates knowledge of basic programing procedures
   6. Demonstrates clean, accurate, and orderly work habits

B. Personal qualities:
   1. Courtesy, friendliness, and tact in dealing with supervisors, professional people, and others
   2. Acceptable appearance
   3. Good personal habits in speech, manners, cleanliness, and method of work
   4. Acceptable attitude
   5. Understanding his role and that of others

Appendix "I" contains some suggestions or reminders of teaching tips.

Training Facilities

The facilities for training should be pleasant, with adequate light, training aids, references, and equipment to permit each student to attain his objectives. Consideration should be given to sound, ventilation, external interference, equipment preparation, adequate spacing, seating arrangement, equipment availability, and time of meeting. Suggested floor plans and equipment are shown in the appendix.

Length of Course and Course Units

The course is developed as supplementary work for people who have had a background in machine tool work. Emphasis should be placed on E.I.A. standards. The instruction is confined to one type of machine tool and controls with the two basic formats (tab sequential and word address) for programing. Additional types of machines and controls could be included with additional time, study, and equipment. This course is not designed to train people in computer programing or maintenance of machine tools.

While this course is designed for point-to-point positioning of machine tools, a brief introduction to computer assistance and computer programing is included at the end of the course.

The following course outlines are meant to serve as a suggested guide only. It is of the utmost importance that the course be adjusted to the background of the trainees and the specific objectives to be attained.

Unit		*Class Room Hours*	*Laboratory Hours*
I.	Introduction to Numerical Control (N/C)	2	1
II.	Review of Blueprint Interpretation	1	2
III.	Review of Machining Methodology	2	1
IV.	Holding Devices	2	1
V.	Programing 1—Two Axis	1	2
VI.	Programing 2—Two Axis	1	2

XX.	Computer Assistance	3	0
		29	31

5463

Units may be shifted in their order of presentation, deleted completely if they are not necessary, or extended if the need becomes apparent. For a group of experienced machinists, it may be advisable to delete blueprint interpretation or use that block of time to convert a conventional engineering drawing to base line dimensions. Units IX, X, and XI (Review of Basic Electricity, Review of Hydraulics, and Review of Basic Electronic Devices) may be deleted and that block of time used for additional programing or operation. It may be advisable to terminate the course after two-axis programing and make three-axis programing a separate course. The intent of this suggested course and resource materials is to aid in the development of courses to fit needs in training and retraining personnel for numerically controlled jobs.

5464

COURSE UNITS

I. INTRODUCTION TO NUMERICAL CONTROL (N/C)

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To give a brief overview of the following:

Introduce and define N/C and its terminology
Present the role of N/C in manufacturing
Acquaint the student with the development and potential of N/C.

Materials

Projector, screen, pointer, blackboard, chalk, eraser, *Glossary of Terms,* information sheets, assignment sheets, and film or films

Unit Outline

A. Course orientation
   1. Objectives
   2. Length of course
   3. Schedule
   4. Standards of performance
   5. Physical facilities
   6. Specific regulations or variations

B. Introduction and explanation of N/C
   1. Basic areas of N/C
   2. Advantages and disadvantages of N/C
   3. Comparison of N/C with conventional procedures
   4. Types of controls
      a. Point-to-point
      b. Continuous path
   5. History or development of N/C machine tools

C. Personnel requirements
   1. Methods analysis
   2. Design engineer or designer
   3. Parts programer
   4. Operating personnel
      a. Fixture or holding devices
      b. Tool preparation
         (1) Conventional
         (2) Preset
      c. Loading and removal
   5. Maintenance personnel
      a. Mechanical
      b. Electrical—electronic
      c. Hydraulic—pneumatic

D. Numerical control programing
   1. Blueprint interpretation
      a. Dimensioning systems
         (1) Base line or absolute
         (2) Incremental
         (3) Undimensioned
      b. Design for production
   2. Method of machining
   3. Holding procedure to obtain maximum advantage
   4. Selection of tools
   5. Planning sheet preparation
   6. Coordinates—rectangular
   7. Reference point
   8. Type of system
      a. Fixed sequential
      b. Tab sequential
      c. Word address
      d. Interchangeable—compatible
   9. Manuscript
      a. Main functions
      b. Auxiliary functions
   10. Tape preparation equipment
   11. Tape, cards, etc.
   12. Test and verification
   13. Operation

E. Glossary of terms—E.I.A.–A.I.A. standards
   1. Fundamental terms
   2. Related terms
   3. Term application

F. Summarize major points

5465

Suggested Activities

(This outline is suggested sequentially.)

Develop the class climate, objectives, and standards
Acquaint students with the physical facilities
Introduce the subject material and issue resource materials
Demonstrate the process if equipment is available or use a film to show the process (laboratory activity)
Answer questions, review information, and summarize the major points
Review standards and make specific assignments

Suggested Assignment

Study resource materials (may be reproduced or modified and used as student handouts).
Study reference materials list and other related references which may become available.
Assign terms to know and understand from the E.I.A. *Glossary.*
Study materials on blueprint interpretation and change incremental dimensions to absolute or base line dimensions.

Resource Materials for Unit I—Introduction to Numerical Control

Numerical control of machine tools is a technique of automatic operation by means of numerical instructions expressed in code. These instructions or programs are prepared in advance. Recorded on punched cards, magnetic tape, or punched tape, these coded instructions can control the sequence of machining operations, machine positions, spindle speeds and rotational direction, distance and direction of movement of the tool or workpiece, flow of coolant, table indexing, and even the selection of the proper preset cutting tool for each operation. The tapes are placed on a control unit—a system of electronic interpreting devices. When the control unit is activated, it can drive the machine tool through the programed operations and movements without human intervention. The machine operator's role is confined largely to starting, stopping, loading and unloading, and observing the tool. The operator can change instructions after each job by replacing the tape on the control unit with another tape containing a different program.

Relation to Conventional Machine Tools

Numerical control can be best understood by comparison with the two conventional types of control generally used in the operation of machine tools. In general purpose machine tools, the most common type, instructions about table direction, spindle speed, and distance the tool must travel in cutting a particular part are established manually by an operator who rearranges various elements such as cams, bars, sequencing, and cycle timers, according to the needs of a particular job. The machine operator consults blueprints and other data to get his instructions. In the second type, the specialized tool, instructions about sequencing, positioning, and tool travel are built into the machine through mechanical—electrical devices, but these are restricted to a fixed set of operations for mass production of parts of one specific design. This type of control is found in types of specialized automatic machine tools used for making

5466

long runs of the same item. This second type of control also results in a high degree of automatic operation. Currently, numerical control is being used for on-off switching.

Both conventional systems require considerable time (compared to numerical control, as will be shown later) for setting up the controls and making expensive tooling such as templates, jigs, and fixtures to guide the cutting tool in its operation. In addition, operation of conventional machine tools does not achieve the high degree of coordination and precision inherent in numerically controlled design.

Numerical Control Development

Automation is actually nothing new. It has been with us from the earliest days of civilized man. In later eras, the potter's wheel, the bowstring drill, water wheel, mule-drawn capstan, wood-turning lathe, and steam engine were but a few of the myriad of inventions which advanced the field of manufacturing. As early as 1725, knitting machines in England were controlled with punched cards. The patterns in cloth were woven according to a prepunched set of cards that directed the weaving machine.

The control of sound was perhaps the earliest effort in automatic control. Early in the 16th century, rotating drums with prearranged pins were used to control chimes in the cathedrals of Europe and in some American churches. Music boxes operated by the same method were the vogue shortly thereafter. In 1863, M. Fourneaux patented the first automatic player piano. This used the principle of air passing through a perforated roll of paper, which in turn actuated the piano keys. This method was improved to the point where the roll perforations were able to control tone, sound intensity, and roll speed.

Charles Babbage[3] designed the first digital computer around 1833, but he never completely finished his work and it was not until 1944 that the first accurate and more versatile computer called the Mark I was developed by Howard Aiken and staff, utilizing Babbage's principles. However, this too was a comparatively slow machine without internal storage facilities. It was in 1946 that a fully electronic computer, the ENIAC, was completed. John von Neumann designed a complete stored program digital computer, the EDVAC, which represented a significant advance over the previous models. In 1951, the first mass-produced computers came on the market, and Neumann's principles can be found in use in the computers used today.

Computers were one of the first tools of what might be called the "Second Industrial Revolution." Automatic operation of machine tools that would be controlled by numbers given to the machine led to the term "Numerical Control," that is, "the control of a machine tool by numbers." A more formal definition of N/C, as put forth by E.I.A., is a system in which the direct insertion of programed numerical values, stored on some form of input medium, are automatically read and decoded to cause a corresponding movement of the machine which it is controlling. These developments relieve the employee of tedious and time-consuming problems of computation and direct handling of machine positioning, as well as the associated duties of proper checking of the completed parts.

Research and development on numerical control, which got underway after 1947, was accelerated by the need of the aircraft industry for new machining techniques that could produce the many intricately designed parts of high-speed planes cheaper, faster, and more accurately than was possible with conventional techniques. Advances in communication engineering, servomechanisms, and electronics, perfected during World War II for directing antiaircraft fire, provided the basis for making numerical control technically practicable.

By 1949, the U.S. Air Force became aware that the complex shapes required for modern aircraft and missile manufacture were causing the various manufacturing programs to fall gradually behind their projected schedules. Manual and tracer-controlled machines could not keep up with the demand and at the same time assimilate the many engineering design changes required.

John T. Parsons, an early pioneer in North Carolina, was given a contract by the Air Material Command to "study the design problems involved in making an experimental machine that would produce contoured surfaces from instructions in the form of punched cards" (IBM Standards). He designed and built a bridge-type planer mill that would machine intricate shapes, pockets, radii, etc., to accuracies of .015 inch. It was, however, an open-loop system with no check as to whether the commanded information was adequately and satisfactorily performed. It was soon apparent that a self-checking medium should be incorporated into the basic machine tool. Parsons persuaded the Massachusetts Institute of Technology to participate as a subcon-

[3] Weinstein and Keim. *Fundamentals of Digital Computers*, pp. 5–6.

5467

tractor to further refine his basic machine and to incorporate checking features inherently in the machine. The contract asked M.I.T. to accomplish the following:

1. Develop a method of "coding" punched tape to reduce the number of tapes required and provide "checking" features to minimize error in the event of equipment failure or malfunction
2. Develop and design electronic equipment to "read" the tape, to convert the instructions to electronic signals, and to use these signals to control mechanical movements of table/or cutter in longitudinal, crosswise, and vertical travel simultaneously
3. Modify an existing tracer controlled mill (Cincinnati Hydro-Tel with tracer control removed) for use with the experimental control systems, to test the system and to point the way for further development and improvement
4. Demonstrate that it would be technically feasible to build and use machine tools employing punched tape control

The initial planning was completed by 1950, and a prototype one–axis system was in operation. This beginning opened the path for rapid advances in this new field, and by 1952 a machine using three axes and establishing the concept of numerical control practicable for industrial use was in operation in the M.I.T. machining laboratory. Refinement of principles and techniques was continued at M.I.T. and also begun by numerous machine tool builders and producers of electronic control and computer equipment. In 1955, the first few commercial models of numerically controlled machine tools were displayed at the National Machine Tool Show and placed in factories for operational use. By 1957, numerically controlled machine tools were installed and used in production in various Air Force contractor plants located across the country, providing an important impetus to industrial application.

Since its commercial introduction, research and development have advanced numerical control significantly. Reliability of control components has been increased, and special systems for a variety of specific machine applications have been devised. A wide range of competing systems featuring varying combinations of electronic, electrical, hydraulic, optical, pneumatic, and mechanical control devices has been made available. The point-to-point controls are usually the least sophisticated; the continuous path system is more complex and requires a far greater input of detailed instructional information than a positioning system. Although direct programing with a desk calculator is also possible for continuous path systems, it would be too time consuming for practical use of the system. Therefore, the use of an electronic computer has become practically indispensable as a computing tool for the programer preparing instructions for machine tools controlled by a continuous path system.

Impact of Numerical Control

The impact of numerical control started slowly but has grown steadily. At first it seemed to be a fad. A few pioneers were experimenting with automatic control systems. Very little attention was paid to the exotic experiments which were being conducted. Even in 1956, curiosity over numerically controlled machine tools was more prevalent than was serious consideration.

When numerical control caught on, it progressed rapidly and interest mushroomed. Two schools of thought emerged. One maintained that a shift of people in jobs, the creation of more jobs, and a better way of life for all would result. The other believed that the industrial revolution was out of control, jobs would be erased much more rapidly than created, and wholesale problems would result for mankind.

One has read and heard much on both sides. It is true that it is necessary to adjust, analyze, prepare, and retain the flexibility and ingenuity so richly inherited. To improve requires a change, but to make a change does not necessitate improvement. It, therefore, behooves each of us to be informed and prepared.

Numerical control is here to stay, if for no other reason than the basic economics of manufacturing. If a competitor can produce more parts with better accuracy at a lower price, he will run you out of business. This is true on the world market and in the smallest of businesses and industries.

Numerical control is only a part of automation, but it is a vital and basic part of our way of work. It has not come to us without some problems, changes, or adjustment anymore than did the industrial revolutions which have preceded the present one.

In October of 1954, *American Machinist* issued a 24–page special report entitled "Numerical Control —What It Means to Metalworking." In summary that report said, "We are on the threshold of an era, perhaps a Second Industrial Revolution, in which manufacturing tools will no longer depend on man's limited dexterity, in which drudgery will be abol-

5468

ished by automatic controls." On October 26, 1964, Special Report No. 559 entitled, "Numerical Control: The Second Decade," was published. If possible, secure this report and read it in its entirety. In case the report cannot be obtained, the following excerpt is included in this manual.

Special Report[4]

Numerical control has made an indelible mark on metalworking in only a single decade. It is revolutionizing the way of life in plants making metal goods. And it is only the beginning.

It promises to have the same revolutionary effect upon the metalworking industry that the automobile has had on the national economy. Since the horse and buggy were replaced by motor cars, life has not been the same. Life in metalworking already is taking on a new aspect as a result of the introduction of numerical control. It is not in our country alone that this is happening. It is happening in Europe, too. And it is spreading to Japan and Russia and perhaps to other far corners of the metalworking world.

Consider what happened in N/C's first decade. Out of the laboratories of the Massachusetts Institute of Technology came the first N/C unit—a milling machine, which was based on experimental work done earlier outside MIT. Giddings & Lewis then made a major breakthrough with its N/C profile skin miller; and the U.S. Air Force soon thereafter placed orders for N/C skin and spar milling machines.

Burg contributed significantly to the creation of a commercial market for N/C machines as a moderate price when it brought out its Burgmaster N/C turret drilling machine. In these early years, and in the years that followed, General Electric, with its N/C system, played a stellar role in working with various machine tool builders in developing N/C machines.

Only a few N/C machines were on display at the 1955 Machine Tool Show at Chicago, but in the latter half of the 1950's, both machine tool builders and N/C system makers went feverishly to work to develop the new concept. It was heavy stuff, because, as one observer says, "Man suddenly had learned a new way to communicate with machines . . . to tell them his most complex thoughts and have them respond." At the end of 1958, another major breakthrough occurred when Kearney & Trecker introduced the first so-called "machining center"—the Milwaukee-Matic. It was the first product on the commercial market embodying the mill-drill, bore-tap concept.

Big Boost at '60 Show

Then came the 1960 Machine Tool Show at Chicago, where almost 100 N/C machines were exhibited. A year later, *American Machinist* checked on the status of numerical control. It found that the U.S. machine tool industry was offering for sale 156 different N/C machine tools. At the same time, 48 control systems were being manufactured.

[4] "Numerical Control: The Second Decade," *American Machinist,* pp. NC 2–5.

Numerical Control was making impressive gains. It was being talked about, written about, and tried out, but it still had a very high price tag on it. N/C machine tools, in fact, were so experimental and expensive that, with few exceptions, they were bought at first only for defense and related operations, especially in the aerospace industry, with Government support. The major task confronting N/C suppliers was to devise a practical, workable machine that could be priced attractively for commercial customers. It would be a machine that little shops as well as big ones could afford. Pratt & Whitney came up with such a machine—its Tape-O-Matic N/C drilling machine (of which around 1,000 have been sold), and still another breakthrough had taken place. Other low-priced N/C drilling machines were soon put on the market by other builders.

N/C Accelerates

How fast was numerical control catching on? In its Ninth Inventory of Metalworking Equipment in 1963, *American Machinist* found that, out of 7,370 plants from which complete returns were received, 316 said that they had one or more N/C machines. These 316 plants possessed around 800 point-to-point N/C machines and 300 contouring machines. On the basis of the returns, *American Machinist* estimated that some 2,800 N/C machines were in use by U.S. metalworkers.

More recently, the U.S. Commerce Department's Business and Defense Services Administration and the Bureau of the Census have come up with revealing figures. More than $217 million of N/C machine tools (3,583 machines to be exact), were shipped to users between January 1, 1954, and December 31, 1963. The acceleration in demand for N/C machines was best shown by what happened during those years. Of the 3,583 machines delivered to customers, little more than 5 percent were shipped in the 5 years 1954–1958 inclusive, 31 per cent in the 3 years 1959–1961, and a dominant 64 percent in the 2 years 1962 and 1963. Out of the total, 2,478 machines had positioning controls, 441 continuous path controls, and 664 dial or plugboard controls.

The growth of numerically controlled machines has been accelerating rapidly, and as of June 1, 1966, approximately 7,000 numerically controlled machines are operating throughout U.S. industry. Of these, 88 percent are of the point-to-point or positioning variety with about 40 percent going to small shops. Numerical control has gained in popularity to such an extent that by 1970, it is anticipated that approximately 75 percent of the new general purpose machine tools being bought will be numerically controlled. This is not too surprising considering the proven economic advantages of numerical control.

Future Directions of Numerical Control

The significance of numerical control lies in the possibility of its becoming a major means of making more automatic the production of items that are

5469

manufactured in small quantities rather than on a mass-production basis. Since industrial experts estimate that about three-fourths of all metalworking production consists of items manufactured in quantities of less than 50 pieces, the economic impact of numerically controlled machining could be quite significant. Such jobbing production is common to all sizes of firms, from small machine shops employing only a few persons to the large plants employing thousands of workers. Moreover, even those firms which produce primarily on a mass-production basis have numerious departments engaged in jobbing production.

Current research and development are directed toward making numerical control the most automatic, universal, and flexible system possible. The future may see, for example, more equipment featuring "adaptive control"—a control refinement that combines automatic machining with constant monitoring of the results. This concept permits a continuously automatic adjustment of the machine and programed feeds, speeds, or other instructions to compensate for such uncontrollable factors as vibrations, cutting-tool wear, and temperature changes.

Another increasingly important development is "the machining center," also called multioperation machine, capable of performing a number of operations in machining a whole part under numerical control. A number of machining centers are already on the market and in operation. Such machines are available in various sizes and capabilities. Some machining centers can be complete machine shops in themselves.

Further important advances through the use of the computer are also being made toward simpler, faster, and more automatic preparation of the machine instructions and control tapes that command the machine. Computer-assisted programing consists essentially of a specially devised symbolic language capable of transmitting a brief, simple description of the machining operations and shape of the workpiece to a computer. In turn, the computer calculates and translates these brief directions into the detailed machine instructions and coded language of the control tape. Computerized programing has become essential in the application of the continuous path type of numerical control where manual programing proves too slow, time consuming, and uneconomic. Its use, however, has been extended to the less complex positioning type of numerical control.

The current advanced state of automatic programing has been due in large measure to the continuing efforts of the users and producers of the numerically controlled machine tool and the computer. At the present time, numerous systems are available, including the well-advanced and widely-used Automatically Programmed Tool System (APT), largely developed by the Aerospace Industries Association on the basis of earlier work started at M.I.T. under contract to the U.S. Air Force.

The possibility of extending the principle of numerical control to other types of production machinery is also being tested. Operations most frequently mentioned as already being successfully adapted to this type of control include drafting, assemblying, riveting, welding, inspecting, testing, tube forming, molding, wire wrapping, and steel rolling. In these applications, tapes or cards on which numerical data about the dimensions, sequence, and timing of operations are recorded, are used to control production equipment. Thus, numerical control has far-reaching implications for other operations in metalworking and for other industries.

What Is Programing?

It is a process which begins with a tooling analysis of the part print, and then involves considering the machine tool, fixtures, and cutters. This process includes operational analysis, the cutter path definition, the geometry of the part, the consideration of proper machining practices, the preparation of the program manuscript, the punching and processing of this data, and the final checkout of the completed program.

The term "programing" can have at least two meanings in most industrial organizations today. These would be the programing of computers and the porgraming of numerical control machine tools. The latter is usually known as "part programing"; it encompasses the use of a computer in the process of producing machine tool programs. This is different from the function of the "computer programer," since he is the one who actually creates the computer routines for use by others.

The computer programer seldom uses the routines he creates, just as the machine tool designer seldom operates the machine he designs.

The common concept of part programing deals with the calculations of coordinate points on the part and the transcription of this information to a program sheet or manuscript, from which the control cards or tapes are punched. This is actually only part of the process of programing. Photos 1 to 6 illustrate the programing processes.

5470

1. Coding the blueprint after receiving the tooling drawing.

The programing process begins with an analysis of the part to be machined. The part programer must first consider the part in relation to the machine tool. Can all operations physically possible be machined on the N/C machine? Are the overall dimensions within the range of the machine tool? Can the required tolerance be held on the machine available? Is the part suitable for numerical control? Can it be defined numerically?

Next, the programer must consider the tooling required to produce the part. He must determine the type of holding device to be used, which often requires a sketch or tool drawing showing the location of the part and the fixture. He must also select the proper type and size of cutters to be used for the job as limited by the geometry of the part, the machine tool, and holding fixture. Standard calculations of RPM and feed rates are used, based on the proper cut speed required by the material, the type and size of cutters, and the limits of the machine tool itself.

After selecting the required tooling, the part programer determines the number of operations re-

2. Completion of the forms.

5471

quired and in what sequence they are to be machined. For each operation he determines the direction of cut and selects a convenient starting and unloading point. Often each operation is laid out on a sketch of the part. These sketches serve as a guide to both the part programer and the machine tool operator as they check out the finished program.

Each operation is described in terms of the geometry of the part. This description is usually translated into the language of the control system through the

3. Completion of forms for a different machine.

4. Typing the manuscript.

5472

5. Typing in the manuscript for a different machine.

use of computer routines. Occasionally, however, a desk calculator is used for this purpose in programing simple shapes. Once the part programer has described the path he wishes the cutter to follow, he adds the required instructions to control the auxiliary functions of the machine tool. These include such functions as feed rate, tool change, spindle, and coolant. All this information is placed on a program manuscript. What actually goes into these manuscripts will be covered later.

The completed manuscript is then carefully checked, usually by another part programer. He asks such questions as: Has the cutter been turned on and off at the right moment? Do the programed heights clear the clamps? Has the cutter path been defined correctly?

The checked information is next punched into paper cards or tape.

The final step in the part programing process is to check out the program. A visual inspection of the printed manuscript is made to check for obvious errors. Many numerical control users have found that automatic data plotters prove a valuable tool in rough checking the program cutter path. However, the resolution of the data plotter is such that the small errors cannot be found. Some manufacturers use the N/C machine tool and cut the program in soft metal, plastic, wood, or the like. Once a program is checked out by the programer, it is ready for production. The final check is on the actual part. Many programers today are verifying the program tape and using the actual part for proveout by the block stop method.

What Sort of Background Should a Part Programer Have?

This question is always asked by the customer considering numerical control. The required background may best be indicated by examining what the part programer does to produce an N/C program.

First, the part programer must be able to read and understand the engineering blueprint. Furthermore, he will be required to understand the mathematical principles (good basic mathematics, applied geometry, and right angle trigonometry) and apply this

Summary

One needs to be informed of numerical control so that an adjustment can be made to it economically, socially, and technically. This chapter introduces only one of its aspects—numerical control in the technical vein—with a hint toward the economic justification or social implications. Further studies in these areas are encouraged. The bibliography will aid in completing the overview and will introduce completely new concepts; for example, "autofacturing."

In regard to the technical aspects, this course reviews the development of numerical controls and identifies the personnel and processes needed to implement parts programing. There are many systems of controls and many personnel structures to accomplish the necessary tasks of implementing and operating numerically controlled machines. This manual will deal specifically with the common knowledge necessary for systems using discrete positioning, or point-to-point control without the use of a computer. The last chapter will introduce computer assistance.

II. REVIEW OF BLUEPRINT INTERPRETATION

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objectives

To acquaint the student with the visualization and interpretation of blueprints
To review base line dimensioning system
To review the selection of machine methodology for part program
To review basic mathematical concepts

Materials

Glossary, blackboard, chalk, eraser, blueprints, information sheets, and assignment sheets

Unit Outline

A. Purpose of blueprints
   1. Basic layout
   2. Orthographic projection
   3. Details and lines
   4. Notes
   5. Dimensions and dimensioning systems
B. Title block
   1. Name of part
   2. Number of piece
   3. Material or materials
   4. Alterations and redesigning
   5. Sealing
C. Bill of material
   1. Number required
   2. Description
   3. Material
   4. Size
   5. Drawing number
D. Visualization
   1. Three-view drawings
   2. Placement of views

5477

3. Lines (alphabet of)
4. Notes and symbols
   a. Process
   b. Accuracy
   c. Surface
   d. Depth
   e. Location
5. Dimensioning
   a. Reference
   b. Length of distance
   c. Tolerance
   d. Finish
6. Cross section
7. Broken-out sections
8. Enlarged details
9. Picture drawings
10. Assembly drawings
11. Detail drawings

E. Special views and assembly drawings
   1. Section views
   2. Auxiliary views
   3. Assembly drawings

F. Materials
   1. Ferrous—nonferrous
   2. Kinds of steel
   3. Plastics
   4. Materials selection factors
      a. Strength
      b. Stability
      c. Weight
      d. Appearance
      e. Cost
   5. Number classifications
      a. Company
      b. Trade names
      c. S.A.E.—A.I.S.I.—A.S.T.M.

G. Supplementary information

H. Machine tool terminology

Suggested Activities

Complete dimensioning changes, coding, and sequencing on the working blueprint

Study machining methodology, particularly speed and feed for various materials

Continue to work on glossary terms and meaning

Resource Materials for Unit II — Review of Blueprint Interpretation

The cliché, "a picture is worth a thousand words," is indeed an understatement about blueprints and engineering drawings. Blueprints and drawings serve as a vital communication link between the engineer-designer, production planner, machinist, tool and die maker, and programer. Therefore, it is of paramount importance that all concerned with the manufacturing processes have a thorough understanding of engineering drawings, blueprints, and tooling sketches. It would be an insurmountable task to call attention to all of the possible variations from A.S.A. standards (American Standards Association) that may be prevalent in various companies' drawings. Hence, the purpose of this chapter is to familiarize the student with the prevailing standard practices, and hopefully lay the ground work for the adoption of these principles by the companies in this field.

Working Drawings

Working or detailed drawings cover a wide range of drawings primarily concerned with the manufacture of parts. Working drawings contain such detailed information as type of raw material, dimensions necessary for fabrication, finished surfaces, and in some instances, degree of finish, heat treatment required, and chemical finish (i.e., paint, anodize). Assembly drawings, on the other hand, show how various parts are related to the whole. "Pictures" for the "do-it-yourselfer" of knocked-down furniture and children's toys are an example of assembly drawings. Generally speaking there are no dimensions on an assembly drawing, hence fabrication from raw stock to end product is virtually impossible. For purposes of this chapter, discussion will be limited largely to detailed or working drawings.

Working drawings are usually limited to one item per sheet. Suppose there were a drawing of a special type of machine bolt 1½–inches long. Obviously it would seem wasteful to have this as the sole item on a sheet. However, when it comes to referencing various parts for inventory control, the other part or

DRAFT 5479

parts, if placed on the same sheet, could easily become "lost." Also, when items are long and complicated, several views may be necessary to show the object; if more than one part were placed on a drawing, it would only cause confusion to the person trying to understand the print.

Usually, "company standards" are found along the bottom or in the lower right-hand edge of the print in the title block, depending on the size of the sheet. Figure II–1 shows a few sample title blocks. Note the type of information found in each. The standard dimensional tolerances, surface quality finishes, etc., as are applicable per company, are usually noted. The scale, although indicated on almost all drawings, is not intended to be used for the purpose of producing the part, but rather to tell the reader that the part is drawn either to an enlarged or reduced size. "Scaling" a print to determine dimensions is frowned upon by most production shops.

Orthographic Projection

Orthographic projection is perhaps the most widely used of all methods of representing parts in a drawing. The prefix "ortho" means right angle, and "graphic" refers to picture. Thus, the prints are right angle pictures of parts. The object is viewed perpendicular to the particular surface. Imagine, for example, a cube. If one were to view one surface of this cube at right angles to it, all one could see would be a square. In order to actually "see" only one side of a cube at a time, however, and still retain the true size and shape of it, one's eye would have to be an infinite distance from the surface. Obviously this is not possible in actual practice, so for purposes of blueprints, the principles of orthographic projection are applied. This enables the draftsman to convey a picture of an object without distortion, as one would actually perceive it. It is imperative that one thoroughly understand this concept if one is to interpret correctly any blueprint, especially detailed working drawings.

An integral concept which parallels that of orthographic projection is that of view arrangement. Let us return to the example of the cube. A cube has six separate surfaces. Thus, using orthographic drawing principles, it is possible to have six separate pictures; that is, one picture of each surface. In the majority of cases, only two or three of the six possible views are used. Use of more views is not only repetitious and confusing, but time consuming. After one becomes more familiar with the relationship which must exist between views (due to method of projection), it can be readily seen that to add more views would indeed be redundant.

Figure II–2(A) shows a three-dimensional drawing of a step block. This is the way it would tend to look if the physical part were viewed with the human eye. By contrast, figure II–2(B) shows the same block as an orthographic drawing. This, with the addition of necessary dimensions and notes, would constitute a working drawing. The various surfaces are numbered alike in their respective figures for ease of understanding.

Although many texts on various aspects of blueprint reading go to considerable length concerning the names of various views, it is not necessary here. What is important and should be emphasized again and again is the relationship that exists from view to view of the various surfaces. Note, for instance, that surface 1, 2, 3, 4 in figure II–2(B) shows as a rectangle (plane) in the view to the lower right. The view immediately to the left shows this surface (1, 2, 3, 4) as a line. The view immediately above shows line 1–3 as a point and line 2–4 as a point. It should be pointed out that each view gives but two overall linear dimensions, namely, length and width, or length and height, or width and height. Thus, as was mentioned earlier, at least two orthographic views are usually needed to describe an object so that the basic overall dimensions of length, width, and height are included.

It should be further pointed out that the relative size of the object does not change from view to view. This is an imperative principle of orthographic projection. This not only aids the draftsman in making the drawing, but it is an aid in interpretation. Knowing that all lines, planes, and points must project from view to view is a definite aid when trying to visualize the part, be it simple or complex.

The various views of the part are drawn separated as shown, primarily for ease of dimensioning. *The distance between views in no way affects the principles of projection.* Wide spacing may make it more difficult to follow various points from view to view by eye, but a straight edge will prove to be a definite advantage. The various views are, as was pointed out, two-dimensional pictures of a surface. Each of these transparent surfaces is then cut apart at a strategic place to enable it to be flattened and placed on a sheet of paper. The projection of the various views is shown in figure II–3. If the transparent projection surface were cut along the dashed line and folded along the other edges, the result would be a picture as shown in figure II–2(B). The job of the

5480

(A) PICTORIAL VIEW OF STEP BLOCK

(B) ORTHOGRAPHIC DRAWING OF STEP BLOCK

Figure II-2. Orthographic projection.

5481

interpreter of this picture is then to "refold" the blueprint into the three-dimensional picture. This requires considerable practice to master. It is suggested that the "apprentice" blueprint reader, as well as the "master" blueprint reader, seek various texts on blueprint reading, or with the aid of an instructor, practice his technique of visualization. A helpful method is to sketch each of the surfaces given, posi-

Figure II-3. Transparent projection of step block.

Figure II-4. Alphabet of lines.

5482

tion as illustrated in figure II–3, and drop lines to intersect, thus forming a pictorial view of the object. For those not skilled in sketching techniques, it is suggested that first sketchings be limited to rectangular objects. Round objects require a slightly different approach.

The Alphabet of Lines

In much the same way, blueprints consist of various interrelated views; each of the views consists of different line types. Some of the lines that make up the alphabet of lines are shown in figure II–4. A complete list can be found in any mechanical drawing text or in Olberg and Jones' *Machinery's Handbook*. Words are formed by combining different letters of the alphabet. Similarly, the draftsman combines different line types to form views that eventually become a blueprint.

Object lines show the *outline* or overall shape of the object. Every edge or surface which is visible from a particular view is represented by an object line.

Invisible object lines, or hidden lines, as they are sometimes called, represent surfaces or edges that are "hidden" from view. It does not necessarily follow that when a hidden line shows in one view and is projected to the next adjacent view, it will become a visible and hence a solid object line. This may be true in some isolated or special cases; however, the student is cautioned against drawing any such generalities or conclusions.

Center lines are used to indicate symmetry of an object or small sections, such as holes, on large objects. The center line is usually indicated by a long and short dash, alternately spaced, but may be shown as simply a fine solid line when representing small holes, radii, etc. The symbol ℄ (meaning center line) might also be noted on either the line type illustrated or the fine solid line. This symbol in no way affects the significance of the line type.

The dimension line is usually a relatively fine solid line, broken to place the dimension (digits indicating size). The arrow heads indicate the termination of the dimension.

Extension lines extend from various places on the object at the exact locations between which the dimension lines are drawn. It should be pointed out that present trends in dimensioning for N/C production are to use but one arrow head and one extension line—the one that is omitted being the one that would return to the zero reference plane.

Dimensions

Thus far the discussion has been limited to the description of the shape of an object. Dimensioning deals with the other major facet of drawings or blueprints; namely, the description of size. For the most part, dimensions are either fractional, decimal, or angular. The majority of prints used primarily in conjunction with N/C machining are of the decimal type. This not only saves time for the programer, but expedites the entire operation. Many companies are in the process of using the decimal system exclusively on new product drawings. These changes are made on existing part drawings by changing all dimensions to decimals. In the majority of industries, it is customary to omit inch marks (″) on all dimensions up to and including 72 inches. For those greater, the distances are usually given in feet (′) and inches (″), with the indicator marks given. To be certain, a check of the title block usually indicates prevailing company standards. The "scale" of the drawing may also indicate probable units of measure of the dimensions.

On all blueprints, either in or near the title block (see figure II–1), a note stating the applicable tolerance for all dimensions is found, unless otherwise specified. Tolerance is the amount of variation permitted in the size of a part or in the location of points or surface. Present-day interchangeable manufacturing makes it possible to make mating parts in widely separated localitites, bring them together, and have all parts fit properly. Without the principle of tolerance, this would not be possible.

Tolerance is sometimes misinterpreted by some production workers who think that they should "set up" to the upper limit (maximum allowable size), and then proceed to make parts. Nothing could be farther from the truth. One should *always* set up to the nominal or stated size of the part. The tolerance has been predetermined to take into consideration such facts as tool wear, machine tool vibration, expansion and contraction of the material due to temperature and humidity changes, etc. Such calculations are the duties and responsibility of the engineer-designer—not the production worker. Some companies have established standard tolerances that apply to dimensions both fractional and/or decimal. If this is the case, these standards should be adhered to unless the blueprint specifies otherwise.

Angles are expressed in one of two ways on a blueprint. First, they can be expressed in terms of degrees (°), which can be further broken down into minutes (′) and seconds (″). Second, an angle can be ex-

5483

pressed in terms of its rectangular coordinates. This designation may be preferred for use with certain types of N/C machines.

Base line dimensioning has many advantages for N/C programing. Figure V–1 is an example of this form of dimensioning.

Notes and Symbols

Frequently on working drawings it is necessary to convey additional information which cannot be done through the media of views, lines, or dimensions. Such information usually is included in notes or symbols. Information typically included may be: type of finish required, number of pieces required, type and specification of material from which the part is to be made, the diameter, coarseness of threads, and class of fit.

Perhaps the most common and important kinds of supplementary information with which the blueprint reader should be familiar are finish marks, material abbreviations, thread types, and taper designations.

Finish marks are used to indicate surfaces that are to be accurately machined according to precise specifications. Grinding, honing, and lapping are but a few typical finishing operations. Some finish marks in general use today are illustrated in figure II–5. The "f" in figure II–5(A) is perhaps the oldest form of finish mark in use today. The crossbar of the letter is placed so as to intersect the surface to be "finished." An equally "antique" designation is shown at (B), the letter superimposed on the line is used to indicate the method to be used to machine that surface, in this case "G" for "grind." The sharp "V" designations shown at (C) and (D) are somewhat modern versions of the "f." The meaning is virtually the same. Recent developments in technology have made it necessary to define more thoroughly surface quality. The A.S.A. (A.S.A. B461–1955) recommends utilization of a symbol similar to the one shown at (E). Such a symbol makes it possible to designate surface roughness, waviness, and lay. Inasmuch as this symbolism is being more widely used by American industry, it might prove advantageous to the blueprint reader to become familiar with it and its interpretation.

In some instances, finish marks may be absent from the part drawing. The blueprint reader should first check notes on the drawing because it may simply state "FAO," meaning "finish all over." Absence of both finish marks and a note regarding finish would mean the part was to be used as produced, i.e., as a rough casting or forging.

Typical thread representations are shown in figure II–6. For the most part, their use is very limited due to the excessive amount of time required for the draftsman to show the graphic style. Threads are represented the same, regardless of their form and series. Assume, for instance, a 1–8N–2, 1–12N–2, and 1–1GN–2 were to be represented side by side by the conventional form. Depending upon the draftsman and the company standards, all three could be shown the same; if these same threads were represented graphically, the number of threads would have to change for each one. Inasmuch as the threads are made primarily from the information on the note, the number of threads shown, if any, is indeed unimportant.

Regardless of the method of graphic representation for the thread, the thread is specified by means of a standard notation. Such a notation would be:

¾—10 UNC—2A

The ¾ is the nominal diameter of the thread; 10 is the number of threads per linear inch of thread. UNC—Unified National Course—is the unified form, COURSE SERIES. The "2" designates the class of fit. The "A" designates an external thread. An internal thread is designated with a "B". Since there is no further designation, this thread would have a right-hand thread. When a left-hand thread is necessary, it is designated as shown below:

¾—10 UNC—2A *LH*

Tapers may be dimensioned in a number of different ways, each of which has its own advantages and disadvantages. One method is a note depicting a certain number, American Standard Taper. Another method would be to dimension a diameter at one end of the shaft, the length of the tapered portion, and then the included angle of the taper. A third method would be to specify, via notes, that the taper is to be turned to certain company standard gages.

The blueprint reader should familiarize himself with various standard abbreviations used in various notes. Countersink, counterbore, spot face, and diameter are but a few words that are abbreviated—some in different ways—on blueprints. A check with a glossary of machine shop term abbreviations might prove helpful.

Special Views

Thus far we have been concerned solely with orthographic views that basically show the exterior surface of a part or object. In many cases, it is very difficult

5484

Figure II-5. Finish marks.

Figure II-6. Thread symbols.

5485

to illustrate clearly all of the necessary details of parts. As was pointed out earlier, various surfaces that cannot be "seen" when viewing an object from a particular direction are shown as hidden lines or invisible object lines. This type of representation, however, soon begins to have limited usage, while still being effective. Thus, to clarify such interior details and to eliminate the need for hidden lines, the principle of section views is employed.

A cutting plane is *assumed* to be passed through the object, and the "pieces" thus formed are separated, exposing the interior construction. For purposes of the "visualization" process of blueprint interpretation, one part is mentally disregarded.

There are several different types of sectional views, cross sections, or sections; however, they are all based on the same principle and differ only according to the kind of information they convey. A brief description of some of the more common types of sectional views follows.

When the cutting plane is passed entirely through an object, a *full section* is formed. Generally, the cutting plane passes from one extremity of an object to the other. For all practical purposes, let it be assumed that the cutting plane in this case is in a straight unbroken line, much like one would cut an orange or an apple.

With some objects, a full section is desirable but not practical, due to the location of various details. That is, if a straight line cutting plane were to be passed through the part, all important details could not be shown in section. To overcome this, an *offset cutting plane* is used. This cutting plane is "bent" at right angles and made to pass through various inner details that would not otherwise be shown. It should be noted that the graphic representation of an offset section is virtually no different from a full section. A look at the section view of the offset does not indicate points of offset. In order to determine points of offset, one must look to the next adjacent view where the cutting plane shows as a line.

Certain symmetrical objects lend themselves to *half-section views*. That is, the section view portion is identical or uniform in shape to the unsectioned portion. In a half section, approximately one-quater of the object is "removed." Half-section views have the advantage of showing both interior and exterior, side by side, in one view.

Occasionally, it is advantageous for the draftsman to represent a small segment or area of the object in section. Removal of a small section without any special notation in any of the other views is known as a *broken-out section*.

The geometry of the spokes of hand wheels, pulleys, and other similar objects with thin spokes are usually difficult to represent by any of the aforementioned section view methods. Here, *revolved sections* which utilize the concept of a cutting plane cut the spoke at a convenient predetermined place. This "cut" is then rotated, in place, 90°. Consequently, the draftsman is able to make an orthographic picture of the shape of the spoke. Not only is this an invaluable aid in showing a shape otherwise difficult to describe, it also can be dimensioned readily. Parts with taper or changing cross-sectional areas are often more accurately described through the use of repeated, revolved sections.

A *removed section* is nothing more than a section view that has been removed from its normal projected position in the standard arrangement of views. Revolved sections are probably the most "frequently removed" sections. The removed section, regardless of type, is relocated at a convenient place on the drawing. A label corresponding to the label on the cutting plane line relates the removed section to the whole part. A removed section is frequently "exploded" or drawn to an enlarged scale to clarify certain details. When this is done, it is sometimes referred to as a *detail section*.

It should be pointed out that in a sectional view, when the cutting plane passes through solid material, the "cut portion" is usually "shaded." Some companies go to great lengths to depict various materials by changing the spacing and crossing diagonal lines in the section. There is a tendency toward the elimination of material designation and identification in the section views, and using just one type of cross-hatching lines. Normally, diagonal lines are spaced about 1/16–inch apart for all materials, the thinking being that the material designation, type, alloy, etc., is detailed in the title block area. The blueprint reader should thoroughly familiarize himself with existing company standards in this respect.

Auxiliary Views

When the object has an inclined surface or surfaces, these surfaces, when projected by orthographic means, do not show their true size and shape in any of the normal orthographic views. In order to show the true size and shape of such inclined surfaces, an auxiliary view of that surface is made. The principle of making an auxiliary view is virtually the same as that involved in orthographic projection; namely, the observer's line of sight must be perpendicular to the particular surface. The resulting picture is then

5486

a true size and shape representation. This is of particular importance when dimensioning. After all, the machinist, tool maker, or whoever may be working with the print is most concerned with a true picture so he can get the proper visualization of the finished object. The term "auxiliary," or "helping," implies that when the draftsman makes the view, he is trying to further clarify the total picture of the part. It is not uncommon to find auxiliary views which appear to be "standing alone in space." In other words, the only surface shown is the slanting surface of the orthographic views. The other surfaces are not shown, because they would become distorted in the auxiliary view. Thus, the whole thing becomes a sort of merry-go-round in terms of where does it stop?

Depending on the complexity of the part and its shape, the draftsman might choose to show two orthographic and one auxiliary views instead of the usual three orthographic views. Orthographic, section, and auxiliary views are an integral part of the total picture of blueprints. In order to have near total understanding of the language of blueprints, it is essential that one understand how auxiliary views fit as a further aid in blueprint interpretation.

Pictorial Drawings

Pictorial drawings, such as are shown in figure II–2(A), have limited usage in production or working drawings. Although it might be argued that such methods of representation are much easier to visualize, the vital aspect of dimensioning becomes not only difficult, but at times almost impossible for accurate interpretation. With all due respect to the various mechanical drawing textbooks, a close check on problems that are pictorially represented will reveal several possible interpretations for a given dimension. It almost goes without saying that present day production technology cannot afford such guess work. Even with the widely used orthographic representations just described, there are altogether too many questionable aspects of these prints!

Pictorial drawings, as was mentioned previously, are used quite extensively for certain types of assembly drawings to show how and where various parts are intended to fit with respect to each other. A special type of pictorial representation, namely perspective, is used widely in architectural-building trades work.

For the most part, pictorial drawings, regardless of their special category, differ from orthographic views in that the pictorial views combine two or more surfaces into one picture, whereas the orthographic views show but a single surface per view. Three-dimensional representation is achieved as compared to two-dimensional pictures.

Summary

This brief chapter on blueprint interpretation in no way is intended to be a complete coverage of the subject of blueprints. Neither does it constitute a comprehensive summary of the area. Rather, it is intended to serve as a quick review of the various aspects most likely to be encountered when working with shop drawings. Blueprint interpretation can indeed be a lengthy, thought-provoking subject. The same could be said of most of the individual areas mentioned throughout the chapter. If the various areas mentioned provide food for thought and promote further investigation, this guide's purpose will have been served.

Education is perhaps a shortcut to experience, but certainly no substitute for it. In much the same way, the various ideas presented are of little value or significance without application to existing company standards in daily working situations.

III. REVIEW OF MACHINING METHODOLOGY

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To review the machining principles
To acquaint the student with the selection of speeds, feeds, and rate of machining
To select the sequence of operations
To select holding devices

Materials

Speed and feed charts, chalkboard, chalk eraser, films, reference materials, tool selection form and/or demonstration

Unit Outline

A. Basic machine tools
   1. Drill press
   2. Milling machine

5487

3. Shaper-planer
4. Lathe
5. Grinder
6. Punching-blanking
7. Forming

B. Machining principles
1. Internal
a. Drilling
b. Reaming
c. Boring
d. Counter functions
(1) Counter boring
(2) Counter sinking
(3) Spot facing

4. Electrical
5. Feedback systems
6. Flat surfaces
7. Dovetail-machine slide system
8. Antifriction devices

F. Operational sequencing
1. Mounting
2. Holding (part and tool)
3. Tool selection
4. Referencing
5. Speed and feed selection
6. Inspection
a. Size
b. Shape
c. Finish
d. Position to reference
7. Auxiliary functions

Suggested Activities

Review machining principles by live demonstration or films

Demonstrate the sequencing operation entry on a tool sheet

Demonstrate speed and feed calculations

Introduce holding devices

Assist student in independent work

5488

Suggested Assignment

Complete the tooling sheet, including speed and feed calculations, from the blueprint of the previous lesson

Study holding devices and coordinate referencing

Continue the study of the glossary of terms

Resource Materials for Unit III — Review of Machining Methodology

Machine designers spend considerable time and effort in developing a machine tool to do specific functions. Those functions may be drilling, boring, milling, spot welding, template shearing, type setting, or numerous others. Many auxiliary or related functions are also necessary to complete a task. The purpose of this unit is to review the basic principles and apply them to the alterations of numerically controlled machines.

In order to apply these principles to numerically controlled machines, a thorough understanding of the part to be machined and the machine tool capabilities is necessary. The key factors which influence machining methods of conventional or numerically controlled equipment are the selection of the correct machine tool, best holding device, and sequence of operations to produce the part accurately and efficiently.

The history of man's development of machines has been a movement toward more efficient production. The first industrial revolution can be attributed in part to improved machining methods which could hold tolerances that would permit part interchangeability. Many improvements have occurred in the past; however, the rate of improvement as it pertains to accuracy and efficient production seems to be accelerating today.

An example of the accelerated improvement is found in the area of drilling. The purpose is to remove material to produce a hole the size, depth, and position called for on the blueprint or sketch. The machine's structure and capacity determine the size of the piece which could be placed in the machine, the size hole that could be drilled, and the accuracy of the work done. The material being drilled would force a judgment in selecting the style of drill. Wood will have one style, cast iron another, steel another, and plastic still another. Even with one material, the lip clearance, number of flutes, etc., would alter. The depth and size of the hole are major items of consideration.

Not only can drilling be done with a drilling machine, but also with a lathe, a mill, or in a machining center. Whether to drill one hole at a time or use attachments to make many holes at a time must also be decided. The process of gauging many and varied types of drills and drilling machines to

13. Two-axis N/C positioning controls.

5489

14. A large turret head drill with cradle-type fixtures.

make many holes in one part is possible. Photos 13 to 18 show some of the numerically controlled machine tools with which drilling is accomplished.

The selections of the methods of machining are many and varied. The concept of numerical control or machining centers are other variations that need to be fitted into our manufacturing procedure. Man's knowledge and judgment are teamed together to select the efficient way of producing each part with the facilities available to him.

The lathe principle of turning the piece while holding the tool has gone through much the same transition. The engine lathe with varied sizes and types, the turret lathe, the automatic screw machine, the chuckers, etc., are all variation of the same principle. Photos 19 and 20 illustrate N/C adaptations to the lathe family, or the control console (Photo 18).

Perhaps the engine lathe of the future will have the ways and bed over the top so that the chips and fluid may drop directly into a container. The reduced wear and part removal time, or other advantages, may be obtained by this design change. This is pos-

15. Two-axis point-to-point system.

sible when the controls are no longer adjusted to man's physical stature.

Milling, another form of metal removal, entails the following considerations: the various sizes, shapes, and forms as predicted by the shape of the cutter, holding the work, turning the tool, or turning both the work and the tool. The cutting of a keyway, a spline, a gear, a thread, etc., has many factors previously mentioned or implied. The rate of machining, speed, feed, and depth of cut are dependent upon the material being cut, the condition of the machine and cutting tool, the amount of material removed, and the accuracy.

The shaper and planer family finds it somewhat more convenient to marry numerical control for on and off functions and a tracer system for some shape. The basic cutting action—whether a shaper, a planer, a grinder, or a milling head is used—is unique to the material being cut, the rigidity of the cutting action, and the material doing the cutting.

Press operations such as shearing, blanking, and

16. Three-axis tool changer-numericenter with tool changer.

5491

17. Tool changer and turret.

forming using the machining principles of shear, machinability, plasticity, hardenability, deformation, and the many others that occur, are a part of the knowledge necessary to manufacture a part by these processes.

The processes of spot welding, tube bending, type setting, or any other process of manufacturing must be understood before any control system will work very well. Numerical control is a tool; its use may assist greatly or it may hinder. The selection of each component which contributes to the end product is of vital importance. The chain is only as strong as its weakest link.

Speed and Feed

Probably the most critical factors in "part programing" or operating are the selection of speeds and feeds. Their selection is dependent upon the

18. Three-axis control, tool selector, indexing (8 position) turntable, and shuttle loading stations.

5492

19. Inserting the tape in a N/C controlled lathe.

following: (1) tool material (high speed steel, carbide, oxide, etc.); (2) material being cut; (3) depth and width of cut; (4) condition of the machine tool; (5) accuracy and finish desired; (6) holding devices (tool and part); or (7) auxiliary functions (cutting fluid, dry, mist coolant, etc.).

Any good reference book will be a guide in developing the speed and feed or chip load relationship. A general formula for determining speed of rotational tools is RPM: $\frac{4 \times \text{Cutting Speed}}{\text{Diam. of the Piece}}$. This is a simple general formula, and the variables are the cutting speed and diameter. Either tables, such as tables 1, 2, and 3, or experimental research and experience, will assist in determining the RPM (revolutions per minute) and the best surface speed.

The feed rates, spindle speed rates, and chip loads used need to be carefully planned and organized. Most manufacturers have established tables in these areas which have been tested through use. If such

20. Control console with tape reader.

tables are available, refer to them when programing. The publications listed in this unit are excellent general references and the tables are only a few of the ready references available.

5493

Table 1: Feeds

Drill size, inches	Feed per revolution
1/8 and less	0.001 - 0.002
1/8 to 1/4	0.002 - 0.004
1/4 to 1/2	0.004 - 0.007
1/2 to 1	0.007 - 0.015
1 and larger	0.015 - 0.025

Table 2: Cutting Speeds

Material	High speed steel* Cutting speed in surface feet/min.
Aluminum and alloys	200 - 300
Brass and bronze, soft	100 - 300
Bronze, high tensile	70 - 90
Cast iron, soft	100 - 150
medium	70 - 100
hard	40 - 60
Steel, low carbon	80 - 150
medium carbon	60 - 100
high carbon	50 - 60
alloy	50 - 70

*Carbon drills one-half table speed.

5494

Table 3: Materials and Cutting Speeds

Material to be milled	High speed steel	Super high speed steel	Stellite	Tantalum carbide	Tungsten carbide
	Cutter speed in feet per minute				
Aluminum	500-1000		800-1500		1000-2000
Brass, soft	70-175		150-200		350-600
hard	65-130		100-160		200-425
very hard	30-50		50-70		125-200
Cast iron, soft	50-80	60-115	90-130		250-325
hard	30-50	40-70	60-90		150-200
chilled		30-50	40-60		100-200
Steel, soft	60-90	70-100		150-250	
medium	50-80	60-90		125-200	
hard	30-50	40-70		100-150	

Information pertaining to the machining processes can be obtained from numerous sources. Many reference books carry information as to chip load, formula calculation, feed rates, spindle speeds, recommended horsepower, etc. The most complete information in one volume may be found in Machining Data[5] used by the Ordinance Corps, U.S. Army.

[5]U.S. Department of Commerce, National Bureau of Standards, Ordinance Corp. Pamphlet, Machining Data (AD 425000), Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia, 1961.

5495

IV. HOLDING DEVICES

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To acquaint the student with various methods of holding parts on an N/C machine tool
To acquaint the student with tool holding devices
To select and reference holding devices for parts and tools

Materials

Charts, pictures, models, examples, film and live machine setup (of the machine tools in your shop)

Resource Materials for Unit IV — Holding Devices

(3 hours of instruction)

Holding devices are numerous and varied. Their

basic purpose is to hold securely the work piece in such a manner that the maximum work may be done with speed and accuracy. Machine tool employees are familiar with the conventional holding units such as vises, right angle plates, indexing heads, hold-down bolts, or even jigs and fixtures.

During World War II, a hole to be drilled or a slot to be milled was carefully laid out, scribed, and prick-punched on the scribed perimeter to hold accuracy. The visual inspection of cutting half the prick-punched mark away was assurance that tolerance was held. To drill the hole in this manner consumed enormous quantities of time.

To lay out the piece, to mound and hold the piece without distortion, to get the tool started properly in each new setting took time and effort, to the extent that about 20 percent of the time was used in actual metal removal—low efficiency at best.

Special jigs and fixtures were developed for special long-run jobs. Drill bushings, faster clamping devices, and table repeatability were developed in response to demand. The accuracy of the machine tool improved with major strides; however, a piece or pieces must still be held.

Numerical control machines in general have a repeatability into the fourth place after the decimal. They have a closed loop control system to assure accuracy. They have indexing tables and standard holding fixtures (Photo 21) which assist in the speed and accuracy of producing parts. However, each piece or set of pieces must be considered as to the manner of holding prior to the programing. To determine the potential of the machine, the following factors must be considered: the type of metal removal necessary, the number of sides to be machined, the material to work with, the premachining necessary, or any of the other variables that may be present.

Numerical control machines with mechanical or

21. Standard holding fixture.

hydraulic movements have the accuracy built in. This is probably the major advantage over retrofitting conventional machine tools to numerical control. The holding units that are used extend the built-in accuracy or deter the complete utilization of the machine.

Nearly all of the numerical control machine manufacturers have incorporated standard holding devices (Photo 19). These holding devices have been developed through periods of testing and experience so that the maximum use may be attained from the machine. This service is extremely valuable in a new installation. Additional service may be requested to assist in developing specific needs that may arise.

Photos 7, 10, 12, 21, and 22 show holding devices. They are located firmly and accurately to be an extension of the table. Each of the locational positions can be easily referenced in x and y on the two-axis movements, as illustrated in figure IV–1. For example, using Photo 21 with a 16″ x 24″ table, travel and use the center large hole as zero reference. The large hole to the left would then be x – 6.0000 and y 0.0000 if the center distance were 6″. The chuck is centered on the large hole to the right, so the center of the chuck would be x + 6.0000 and y 0.0000. In this manner, any standard holding device can be located and referenced easily, quickly, and accurately.

The vise in Photo 10 can be used to reference from

22. Tooling cart and standard holding devices.

5498

the solid jaw, and the height of the piece can be established from the vise base top to the milling cutter. The table can be programed so the next piece can be loaded to either side and then fed under the cutter. Many possibilities are available, depending upon the ingenuity of the programer.

Further use may be made of standard holding devices by additional specific units developed in cooperation with the tooling departments. In many cases, small variations and/or additions increase the use and versatility at very moderate cost. The unique holding devices observed by the author were the result of teamwork between the operator, programer, and tooling design people.

Standard holding devices vary with each machine style. The reciprocating quill in the vertical position, the turret head machines, the horizontal spindle machines, and the indexing tables, all have some advantages or disadvantages. Some are better suited for one type of task than another. The ingenuity of the team can get the maximum benefit for all.

The indexing table with standard or special holding devices has a definite advantage for many types of pieces. The valve body has two flanges to be milled and six holes to be drilled and tapped. The two ends that are identical can be programed exactly the same if the holding device can locate the valve body over the center of the table. The piece may be rough, as the part does not lose its basic reference. In other cases, three, four, or more sides may be processed at one setting with table indexing.

The standard size blocks similar to gage blocks can be used to space finished or semifinished parts with uneven or nonflat holding sides. They may also be used to space out a part to be drilled, tapped, or bored through. Numerous other uses for modular blocks will develop as standard and special-holding methods are used.

Many other standard holding devices may be employed, such as indexing heads (direct or differential, plain or universal, angle plates, vee blocks, clamping devices activated mechanically, pneumatically, or hydraulically), chucks, etc.

Each holding device needs to hold the part accurately and firmly, to be easy and quick to load and unload (even when a shuttle pallet is used), to be adapted to existing devices if possible, and to be developed with the ingenuity, knowledge, and skill of the tool designer, programer, and operator.

Tool Holding Devices

Tool holding devices vary greatly. Straight and tapered shank holders of the fixed and adjustable variety can be found. Conventional tapers, collets, and series of straight holders with various locking devices supply the machine tools with the holding and alinement of the tool.

Many of the numerical control machines use preset tooling. This is especially true for three-axis programed control. Each tool is preset to a specific distance extending beyond the spindle nose. Adjustments within the holder make it possible to use standard tooling with the adjustment available to sharpen and reset the tool. This process assists the programer in setting the spindle traversing and depth coordinates.

The selection of tools has another type of holding device. This process may vary from standard tools in standard holding devices (Photo 22) to special holding devices which select the location (Photos 16, 17, and 18) of the next tool in readiness to make an automatic change. Some of the automatic tool changers call for a sequencing of tools as they are to be used. These tools need to be loaded only in the order of use. Other systems program a socket code. The coded socket rotates under the spindle as soon as the spindle is empty and withdrawn. Others code the tool, so when the tape calls for a tool, it will rotate into position for change. Each system seems to work well on the machines for which it is designed.

In the case of holding devices for work or tools, it is necessary to work with specific systems to understand the process and make adjustments pertaining to the selection. As one proceeds into programing, each of these areas falls into its proper place.

Manuals written specifically for the machine or machines which are used are helpful. An inspection of the hardware is likely to be most valuable in completing one's understanding of holding devices for parts or tools. While inspecting the hardware in these areas, check carefully the activating devices of the head.

Nearly all of the machines in use at present have varied methods for holding and sensing the work to be done. Manual, semiautomatic, fully automatic, or combinations with special features should be noted and evaluated, both for the purchase of the machine tool and its use. Examples of these features might be hydrosensing, cam depth control, or dialed readout on the console. To become familiar with all systems takes considerably more time than is allotted in this lesson.

V. PROGRAMING 1 — TWO AXIS

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objectives

To select and code a series of holes
To establish and position a setup point and reference zero point
To position the coded holes by the Cartesian coordinate system

Materials

Blueprint to code, coordinate sheets, chalkboard, chalk eraser, reference material, specific machine information

Unit Outline

A. Visualization of the project
   1. Interpretation of the print
   2. Coding of the holes
      a. Order or procedure
      b. Operations to complete task
      c. Selection of the path
   3. Establish a reference point
   4. Redimension if necessary
B. Determine holding method
   1. Rigidity
   2. Clear surface of holding hardware
   3. Clear table to drill and tap through piece
   4. Place clamps over parallels
   5. Position on table
C. Procedure to position setup or reference zero
   1. Methods of positioning
      a. Mechanical
      b. Electrical
      c. Hydraulic
      d. Combination
   2. Methods of referencing
      a. Fixed zero
      b. Floating zero
   3. Table movement
   4. Saddle movement
   5. Controls and reset procedure
   6. Translating position to zero reference
D. Cartesian coordinate system
   1. Planes
   2. Axis X and Y explained and identified
   3. Standard system
   4. Positive and negative quantities
   5. Quadrants
   6. Z or third axis
   7. Tabling the coordinates of the coded holes
E. Controls
   1. Table and saddle
      a. Mechanical
      b. Electrical
      c. Hydraulic
      d. Manual
      e. Feedback systems
      f. Rate of movement to position
      g. Guide structure
   2. Head
      a. Parts and names
      b. Mechanical
      c. Hydraulic
      d. Pneumatic
      e. Electrical
      f. Depth controls
      g. Speed selection
      h. Tool changing
F. Retrofitting vs. N/C machine tools
   1. Advantages
   2. Disadvantages

Suggested Activities

Demonstrate the location of reference zero, taking into consideration the machine tool, control system, and holding device
Demonstrate coding the sequence of operation by the Cartesian method
Demonstrate the preparation of the blueprint by dimensioning
Individualized assistance as the student programs

VI. PROGRAMING 2 — TWO AXIS

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objectives

To acquaint the student with head functions and operations

To select tools to perform the operations to the accuracy required

To acquaint the student with speeds and feeds

To sequence the operation with the least loss of time

To acquaint the student with the planning and organization needed to complete a manuscript

Materials

Film, chalk, chalkboard, eraser, projector, blueprints, coordinate sheet, tool sheet, manuscript blank, spot or center drill, adapters, drill taps, machine (if possible), machine manual

Unit Outline

A. Drill machine head
   1. Functions
      a. Spindle
         (1) Drive
         (2) Speed range and control
         (3) Rigidity
         (4) Rotation—reversing
         (5) Tool holding devices
      b. Quill
         (1) Conventional mode—mechanical
         (2) Pneumatic motion
         (3) Hydraulic motion
         (4) Feed rate
         (5) Depth stops—mechanical, electrical
         (6) Automatic return
         (7) Floating feed—tapping
         (8) Rapid travel
   2. Positioning
      a. Locking
      b. Raising and lowering
      c. Turrets
      d. Drives
      e. Columns—squareness

B. Tools
   1. Spot or center drills
      a. Cutting edges
      b. Angle of cutting edges
      c. Relief
      d. Feed
      e. Speed
      f. Depth calculations
   2. Drills
      a. Standard drills
         (1) Name and function of parts
         (2) Cutting edges—length of cuting edge, angle of cutting edge, and relief
         (3) Thinning of dead center
         (4) Materials
         (5) Feed rates in inches per minute and thousands per revolution
         (6) Coolants
      b. Special drills
         (1) Sizes
         (2) Flutes
         (3) Combination with other tools
      c. Tape
         (1) Kinds
         (2) Name, parts, and function
         (3) Lead, pitch, and thread shape
         (4) Coolants
         (5) Feed and withdrawal
      d. Reamers
         (1) Kinds
         (2) Name, part, and function
         (3) Types
         (4) Feed rate
         (5) Coolant
      e. Milling
         (1) Kinds
         (2) Feed rates
         (3) Speed rates
         (4) Coolant
      f. Holding devices
         (1) Chucks
         (2) Adapters
         (3) Sleeves
         (4) Special

C. Tool list
   1. Purpose
   2. Selection
   3. Tool description
   4. Speed calculation
   5. Feed calculation
   6. Depth calculation
      a. Approach allowance
      b. Overtravel
      c. Drill point and depth

d. How to determine—measurement references
e. Deep hole procedure
7. Auxiliary functions
a. Coolant
b. Tool removal
c. Preset adapters
d. Tool changing

D. Coordinates
1. Zero shift
2. Sequence reversal
3. Establishing a reference from a hole

E. Manuscript
1. Purpose
2. Entries
3. Checking of the entries
4. Auxiliary functions
5. Introduction to tape

Suggested Activities

Demonstrate the process of entries into a manuscript using the tool and coordinate sheets
Explain the reasons for the order of entry based on the part and the machine used
Individual assistance as the student completes his manuscript

References

Manual of the machine used
Manual of the controls used
Sample program completed

Films

Film of the machine and controls being used
Sample: *Drama in Drilling*. Brown & Sharpe.
Film of other machines

VII. TAPE

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To acquaint the student with the function, process, and equipment to produce a control by punched tape
To acquaint the student with the reaction devices and systems of punched tape control
To assist the student to complete a manuscript and punch the tape
To acquaint the student with the language and use of numerically controlled equipment

Materials

Films, projector, chalkboard, eraser, tape, punched tape, tape punching equipment, tape verifying equipment, tape controlled machine to run through the control, if possible

Unit Outline

A. E.I.A. standard codes
1. Purpose of standards
2. Physical characteristics
a. Width
b. Length
c. Dimensions
d. Purpose
3. Uses
4. How standards are achieved

B. Materials
1. Paper
2. Plastic
3. Laminated
4. Metallic
5. Others

C. Binary code
1. Purpose
2. Procedure
3. Justification
4. Binary-decimal (BCD)

D. Format
1. Point-to-point—continuous path
a. Words
b. Blocks
c. Address
d. Procedure
2. Types
a. Fixed sequential
b. Tab sequential
c. Word address
d. Universal
e. Other
3. Parity check
4. Auxiliary functions

Figure VII-1. E.I.A. Standard coding for 1-inch wide, eight-track tape.

E. Tape punching equipment
   1. Friden Flex-O-Writer
   2. Dura
   3. Others
F. Control and feedback systems
   1. Reader
   2. Servo-mechanisms
   3. Open and closed loop systems
      a. Movement
      b. Purpose
      c. Feedback
      d. Advantages

Suggested Activities

Issue prepared tape and interpret a portion of the manuscript as it appears on the tape

Demonstrate the process of producing the tape from the manuscript

Demonstrate the verification of the tape

Demonstrate the operation in the machine tool to be used

References

Electronic Industries Association. *One-inch Perforated Tape.*

———. *Character Code for Numerical Machine Control Perforated Tape.*

VIII. TEST THE PROGRAM

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objective

To complete a program, verify the tape, and test the program

Materials

Manuscript, tape, tape punching equipment, tape verifying equipment, printout of tape, a machine to test the tape, and a part to machine

Unit Outline

A. Manuscript
   1. Inspect part
   2. Interpret blueprint
   3. Select machine tool
   4. Select holding device
   5. Code blueprint
   6. Complete tooling selection and calculations
   7. Complete the coordinate sheet
   8. Complete entries onto the manuscript
B. Tape
   1. Punch the tape
   2. Verify the tape
   3. Check printout against manuscript
   4. Make corrections
   5. Recheck the tape
C. Test program
   1. Mount and reference holding device
   2. Select and prepare tools
   3. Mount part
   4. Insert tape
   5. Test program
   6. Inspect part
   7. Run program
D. Evaluate the test
   1. Processes
   2. Cost
   3. Time
   4. Accuracy

Suggested Activities

Review manuscript for completeness and accuracy

Review tape punching and verifying

Individual assistance on completion of tape punching and verifying

Demonstrate the test on the machine tool

Demonstrate a part being run after testing is completed

Reference

Manuals of the equipment being used

6610

IX. REVIEW OF BASIC ELECTRICITY

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To acquaint the student with a basic concept of electricity and the electron theory

To illustrate to the student how Ohm's Law and Kirchoff's Law are used in relation to a series circuit

To acquaint the student with fundamental motor principles

To explain and illustrate the use of fuses and/or circuit breakers, relays, and limit switches

To familiarize the student with electrical symbols and schematic diagrams used in electrical work

Materials

Information sheets, chalkboard, chalk, eraser and pointer, wire, dry cells, lamps, volt-ohm-ammeter, various resistances, permanent and electro-magnets, iron filings, various types of motors, electrical prints (schematic diagrams), fuses, relays, and limit switches

Unit Outline

A. Introduction to electricity
   1. The electron theory
   2. Factors in electricity—voltage, current, and resistance
   3. Methods of generating voltage—friction, heat, light, Piezo-effect, chemical and mechanical
   4. Ohm's Law
   5. Kirchoff's Law

B. Electrical circuits
   1. Series circuit
      a. Definition
      b. Use of Ohm's Law in solving for circuit values
      c. Kirchoff's Law
      d. Application of measuring instruments
   2. Parallel circuit
      a. Definition
      b. Use of Ohm's Law in solving for circuit values
      c. Kirchoff's Law
      d. Application of measuring instruments
   3. Series-parallel (combination) circuit
      a. Definition
      b. Use of Ohm's Law in solving for circuit values
      c. Kirchoff's Law
      d. Application of measuring instruments

C. Fundamentals of magnetism
   1. Phenomena of permanent magnetism
   2. Law of magnets
   3. Magnetic and nonmagnetic materials
   4. Phenomena of electromagnetism
      a. Structure and operation of electromagnets
      b. Application

D. Motors
   1. Fundamental motor principle
   2. Series, shunt, and compound motors
   3. D.C. and A.C. motors
   4. Motor applications

E. Design and functions of electrical control devices
   1. Fuses and/or circuit breakers
   2. Switches
   3. Relays
   4. Limit switches

F. Electrical symbols and schematics
   1. Match electrical component and symbol of same
   2. Analyze circuit drawings (schematic diagrams)

Suggested Activities

Demonstrate the basic circuits and explain the principles of each

Demonstrate the operation principles of the electrical power system on the machine tool using the manual's schematic diagram as the guide and applying the principles of each component

References

Lister *Electric Circuits and Machines.*

Manual of the machine tool

X. REVIEW OF HYDRAULICS

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To acquaint the student with the principles of a hydraulic system and its component parts

To apply the hydraulic principles to machine tools

To acquaint the student with the advantages of hydraulics

Materials

Hydraulic diagrams, machine tool manual, machine tool circuit diagrams, cutaway models, film, chalkboard and accessories, live demonstration on a machine tool or demonstration unit

Unit Outline

A. Introduction and orientation
   1. History and background
   2. Basic principles and fundamentals of fluids
      a. Density
      b. Specific gravity
      c. Define fluids
   3. Pascal's Law
   4. Boyle's Law
   5. F = P x A

B. Pumps
   1. Types
      a. Gear-type pumps
      b. Vane-type pumps
      c. Piston-type pumps
      d. Centrifugal pumps
   2. Fluid motors
   3. Capacity
   4. Pressure

C. Cylinders
   1. Single acting
   2. Double acting
   3. Capacity
   4. Load

D. Valves
   1. Pressure control valves
      a. Relief valve
      b. Pressure reducing valve
      c. Pressure sequence valve
      d. Unloading valve
      e. Pressure switch
   2. Volume control valve—flow current valve
   3. Direction control valve
      a. Four-way valve
      b. Check valve
   4. Miscellaneous valves
      a. Prefill check valves
      b. Pilot valves

E. Reservoirs
   1. Capacity
   2. Location
   3. General design
   4. Air filters
   5. Accessories

F. Piping
   1. Tubing
      a. Rigid
      b. Flexible
   2. Fittings
      a. Flared tube
      b. Flareless tube
      c. Welded tube
      d. Screwed pipe connectors
   3. Accumulators
      a. Types
      b. Precautions in use

G. Packing
   1. Basic packing types
   2. Materials
   3. Design
   4. Specifications

H. Fluids
   1. Classes
   2. In service
      a. Gravity settling
      b. Centrifuging
      c. Continuous reconditioning
   3. Viscosity and sludge accumulation

I. Application of hydraulics principles
   1. Tracing a flow chart
   2. Setting up a system

5512

3. Identifying the component parts of a system
4. Uses of hydraulic systems in industry
5. Relationship of electronics, air, and mechanisms to hydraulic systems

Suggested Activities

Demonstrate a typical hydraulic circuit, illustrating each of the major components and the principle upon which it operates

Diagram the circuit of the J.I.C. standard system

Trace a hydraulic circuit on a machine tool from the manual

References

General Motors Institute. *Hydraulic Control of Machine Tools.*

Oster. *Basic Applied Fluid Power.*

Pippenger and Hicks. *Industrial Hydraulics.*

Vickers. *Industrial Hydraulic Manual.*

Manual of machine tool (applicable to hydraulics or pneumatics)

XI. REVIEW OF BASIC ELECTRONIC DEVICES

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To explain and describe an electronic device.

To familiarize the student with the vacuum tubes and solid-state devices used in N/C

To show the advantages in the use of electronic devices in N/C

Materials

Information sheet, vacuum tube and transistor charts, chalkboard, chalk, eraser, pointer, control system schematic of the machine tool controls

Unit Outline

A. History of electronics
   1. The Edison effect
   2. The Fleming valve
   3. DeForest's triode

B. Control features of vacuum tubes
   1. Analysis of rectifying action of diodes and analysis of rectifying circuits
   2. Amplifying action of triodes
      a. Simple linear amplifier
      b. D.C. and A.C. amplifiers
      c. Pulse amplifiers

C. Fundamentals of solid-state devices
   1. Crystalline structure of germanium or silicon
   2. Adding impurities to germanium or silicon to provide proper operation
   3. The solid-state diode
   4. Rectification similar to the vacuum tube diode

D. The transistor
   1. Structure
      a. Emitter
      b. Base
      c. Collector
   2. Similarity to vacuum tube triode
   3. Simple transistor amplifiers
      a. Linear
      b. Pulse
   4. Additional transistor developments
      a. Zener diode
      b. Transistor tetrode
      c. Silicon control rectifier (SCR)
      d. Tunnel diode

E. Control applications of vacuum tubes and transistors in N/C circuits
   1. Need for rectification
   2. Need for amplification
      a. Linear
      b. Pulse
   3. Speed of operation

F. Applications to controls for N/C

Suggested Activities

Demonstrate a complete control system identifying each component, its function, and its operating principle

Trace a series of commands to the machine movement from the schematic diagram

References

Chute. *Electronics in Industry.*

Manual of machine tool controls

XII. CONTROL SYSTEMS

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objective

To acquaint the student with the basic operational principles of various control systems

Materials

Manuals of control systems from several different manfacturers, charts, instruction sheets, and examples of various controls, resource people from control systems should also be utilized

Unit Outline

A. Controls
   1. Kinds and functions
   2. Capability of controls
   3. Axis movement control
   4. Open and/or closed loop
   5. Accuracy of the machine to controls
   6. Advantages and disadvantages of each
B. Methods of input
   1. Manual
   2. Tape
   3. Electrical
   4. Pneumatic
   5. Hydraulic
   6. Mechanical
   7. Combinations
C. Movement systems
   1. Mechanical
   2. Electrical
   3. Hydraulic
   4. Pneumatic
   5. Combinations
D. Feed back controls
   1. Transducers
      a. Linear
      b. Rotary
   2. Optics
   3. Read out systems
   4. Open loop
E. Retrofitting
F. Maintenance

Suggested Activities

Classify the control systems such as a family of controls

Illustrate the capabilities of each system and the principles on which each functions

Demonstrate the various capabilities of a machine tool dependent upon the controls installed for it

Individual assistance

References

Manuals of several different machine tools and the controls which can be used to control them

XIII. AUXILIARY FUNCTIONS

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objective

To acquaint the student with the auxiliary functions and equipment available on N/C machine tools

Materials

Charts, sample programs, auxiliary equipment, diagrams, models, and/or the equipment

Unit Outline

A. Auxiliary equipment
   1. Identify and classify
   2. Built into the machine and controls
   3. Attachments
   4. Operational principles and function
   5. Economic justification
B. Work holding equipment
   1. Referencing plate and attachments
   2. Indexing
   3. Angular
   4. Jigs and fixtures
C. Tool holding devices
   1. Tooling adapters (preset)
   2. Tool changers
      a. Sequencing
      b. Random selection
D. Auxiliary functions
   1. Coolant control
   2. Spindle reversal

5514

3. Tool selection
4. Tool change
5. Feed and speed change
6. Indexing
7. Others

Suggested Activities

Identify and classify auxiliary functions and equipment

Issue programs and illustrate use of auxiliary functions

Demonstrate the application and principle of auxiliary function

Individual student assistance

References

Manuals of machine tools with various auxiliary functions

XIV. PROGRAMING 1 — THREE AXIS

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objective

To assist the student in programing a three-axis machine tool (development of blueprint coding, sequencing, tool list, and coordinate record)

Materials

Blueprints, sample programs, manuals for machine tools and machine tool control systems, tool sheets, coordinate sheets, and manuscript sheets

Unit Outline

A. Introduction
   1. Identify the part and the operations necessary
   2. Select the machine tool
   3. Identify the control system
   4. Select the holding device
   5. Select the format for the program

B. Blueprint work
   1. Reference the holding device
   2. Dimension the work (base line system)
   3. Code the blueprint
   4. Select the tools
   5. Sequence the operations
   6. Enter the coordinates

C. Format for programs
   1. Tab sequential
   2. Word address
   3. Combination
   4. Fixed sequential
   5. Others

D. Special holding devices
   1. Indexing
   2. Angular
   3. Jigs or fixtures

Suggested Activities

Issue the blueprints, tool sheets, and coordinate sheets

Select the format, machine tool and control system, and review with the class

Demonstrate the basic procedures

Individual assistance

References

Materials from the preceding units

Manual of machine tool

Manual of control system

Completed tool sheets (similar program)

Completed coordinate sheets (similar program)

XV. PROGRAMING 2 — THREE AXIS

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objective

To assist the student in programing a three-axis machine tool (development of a manuscript and transfer to punched tape)

Materials

Sample manuscripts, sample tapes, tape punching equipment, tape verification equipment, manuscript sheets

Unit Outline

A. Material organization
   1. Tool list

2 Coordinates
3. Sequencing
4. Calculation
5. Auxiliary functions
6. Tool coding
7. Others

B. Manuscript
1. Entries onto the manuscript
a. Format
b. Sequencing
c. Accuracy
d. Permissible omissions
e. Longhand entries
f. Typed entries — punch tape
g. Repeat sequences
2. Entries by other methods

C. Verification of the tape
1. Printout—visual check
2. Item by item check
3. Block by block check on the machine tool

Suggested Activities

Demonstrate the process of completing a manuscript

Demonstrate the tape punching process and the verification of the tape

Individual assistance

References

Manuals and papers of the programing process such as:

Cincinnati Milling Machine Co. *Customer Training for Numerical Control.*

Ex-Cell-O Corp. *Guide Book for Numerically Controlled Machine Tools.*

Friden, Inc. *Friden Flexowriter for Numerical Control.*

Kearney & Trecker Corp. *Control Data for 3-Axis Model II.*

Square D Co. *Controlling from Tape.*

XVI. PROGRAMING 3 — THREE AXIS

Training Time

Laboratory, 3 hours

Objective

To assist the student to complete and test his program

Materials

Student's manuscript, tape, a corrected manuscript and tape, and a machine tool and part to test the program

Unit Outline

A. Check material prepared
1. Manuscript
2. Tape
3. Blueprint

B. Test program
1. Load part
2. Load the tape
3. Prepare tooling as needed
4. Energize the machine tool
5. Make the test
6. Evaluate the piece machined

C. Automatic run of a part

Suggested Activities

Demonstrate checking procedures

Demonstrate the testing procedure on the machine tool

Demonstrate automatic cycle

Assist student with his project

References

Master blueprint used

Master preparation sheets

Master manuscript and tape

XVII. PROGRAMING A SLOPE

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objective

To acquaint the student with the principles of programing a slope and assist him in the programing procedures

Materials

Blueprint (slope surface), coordinate sheets, manuscript form, sample program, sample tape, machine tool and part

Unit Outline

A. Control capabilities
   1. Movement in x or y
   2. Movement in x or y simultaneously
   3. Distance movement limitations
   4. Time of movement delay

B. Mathematics review
   1. Trigonometry of right triangle
   2. Chart interpretation
   3. Angle of slope

C. Programing
   1. Determine starting point
   2. Calculate for size of cutter
   3. Determine movement
   4. Calculate and record coordinates
   5. Punch tape
   6. Verify tape
   7. Test program

Suggested Activities

Review the control limitations of the machine tool used

Demonstrate the procedure for calculating the coordinates

Demonstrate the machining of a slope

Individual student assistance

References

Gettelman. "Let's Discuss Numerical Control in Simple Language," *Modern Machine Shop.*

Manual of the machine tool and controls

XVIII. PROGRAMING AN ARC OR CIRCLE

Training Time

Classroom, 1 hour; laboratory, 2 hours

Objectives

To acquaint the student with the principles of programing an arc or circle and assist him in the programing procedures

Materials

Blueprint (arc or circle), coordinate sheets, manuscript form, sample program, sample tape, machine tool and part

Unit Outline

A. Geometry of the arc or circle
   1. Calculate coordinates
   2. Describe arc path
   3. Describe cutter path

B. Procedures of cutting arcs and circles
   1. Tracer
   2. Point-to-point
   3. Continuous path

C. Limitations of point-to-point
   1. Limits of control
   2. Limits of procedure
   3. Limits of describing path
   4. Limits of process

D. Introduction of continuous path
   1. Methods
   2. Equipment
   3. Procedure

Suggested Activities

Demonstrate procedure for selecting and calculating coordinates

Demonstrate programing procedures

Introduce other methods of cutting an arc or circle

Individual student assistance

References

Giddings & Lewis Machine Tool Co. *Bickford Numer-Mite; Programming Instruction Manual.*

Jacobowitz. *Computer Arithmetic.*

Magor. *Contour Tracing in Relation to Numerical Control* (conference paper).

McCarty. *Automated Programming from Undimensioned Drawings* (conference paper).

XIX. TEST THE PROGRAMS

Training Time

Laboratory, 3 hours

Objective

To test the programs developed for cutting slopes and arcs

Materials

Tested programs, tested tapes, reference blueprints, tape punching equipment, tape verifying equipment, machine tool to use for testing and demonstrating, and a part to machine

Unit Outline

A. Verify program
   1. Tool sheet
   2. Coordinate entries
   3. Manuscript
   4. Tape

B. Test programs
   1. Mount part
   2. Select and insert tool
   3. Load tape
   4. Reference tool to part
   5. Test procedure
   6. Inspect part

Suggested Activities

Demonstrate cutting a slope and an arc or circle

Individual student assistance

References

Tested program

Tested tape

Tested part

XX. COMPUTER ASSISTANCE

Training Time

Classroom, 3 hours

Objective

To acquaint the student with computer assistance to programing

Materials

Sample programs, a field trip and/or a demonstration, charts, diagrams, and resource people

Unit Outline

A. Computer
   1. Function
   2. Basic operation
   3. Computer language
   4. Pre and post processors

B. Program preparation
   1. Format
   2. Application
   3. Limitations
   4. Personnel
   5. Economic justification
   6. Systems

C. Computer control

Suggested Activities

Introduce the principles of computer assistance

Demonstrate the programing of a part by computer assistance

Introduce computer programing

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

FILMS

These films should be booked well in advance. The borrower is obligated to pay the transportation costs.

Breaking the Gaging Bottleneck. 16 mm., sound, 15 min., color. Pratt & Whitney Co., Inc., Advertising Department, Charter Oak Boulevard, West Hartford, Conn. 06090.

Summary: This film describes the Pratt & Whitney Sigmatic Multi-Dimension Gaging Machines and their use in precision gaging applications.

Changing Months to Minutes. 16 mm., sound, 15 min., color. Kearney & Trecker Corp., Advertising Department, 11000 Theodore Trecker Way, Milwaukee, Wis. 53214.

Summary: This film tells the story of Milwaukee-Matic, a single unit, numerically controlled machining center. This unit performs such operations as milling, boring, drilling, and related functions automatically and shuttles workpieces on and off the machining area.

Cutting a Dovetail Taper Slide. 16 mm., sound, 25 min., b & w. Kearney & Trecker Corp., Advertising Department, 11000 Theodore Trecker Way, Milwaukee, Wis. 53214.

Summary: This film shows every step in the process of milling a dovetail taper slide, from the planning of the job, through the layout, to the final checking. Such important details as the various cutters necessary and how to use a rotary table in milling a taper are also covered.

Cutting Edge, The. (1963) 16 mm., sound, 29 min., color. Norton Co., Advertising Department, Worchester, Mass.

Summary: This film demonstrates in detail the procedure in sharpening the four basic types of milling cutters—staggered tooth side milling cutte[illegible], reamers, and inserted blade face mills—that are used in every manufacturing plant or machine shop of any size.

Drama in Drilling. 16 mm., sound, 20 min., b & w. Brown & Sharpe Manufacturing Co., 235 Promenade Street, Providence, R.I. 02900.

Summary: This film presents the Brown & Sharpe turret drilling machine. It demonstrates and explains the principle of work positioning and drilling in connection with the use of this machine.

From Print to Product. 16 mm., sound, 30 min., color. Kearney & Trecker Corp., Advertising Department, 11000 Theodore Trecker Way, Milwaukee, Wis. 53214.

Summary: This film shows the Model D Rotary Head milling machine performing many unusual and intricate operations.

Highway to Production. 16 mm., sound, 30 min., color. The Cincinnati Milling Machine Co., Advertising Department, 4701 Marburg Avenue, Cincinnati, Ohio 45200.

Summary: This film tells the story of the part machine tools have played in man's quest for material comforts, and demonstrates the building of milling machines, from the pouring of the iron to the final inspection.

Kellering. (1959) 16 mm., sound, 22 min., color, Pratt & Whitney Co., Inc., Advertising Department, Charter Oak Boulevard, West Hartford, Conn. 06090.

Summary: This film illustrates and explains how the Pratt & Whitney Keller machine pioneered the art of automatic tracer-controlled milling to reproduce accurately the shape of any two-dimensioning template or three-dimensional full model. It depicts and explains how the Keller machine is engineered and manufactured to produce economically dies, molds, and any

5524

81

other work pieces having irregular shapes or complex geometrical curves. (Cleared for TV.)

Little Showoff, The. 16 mm., sound, 20 min., color. Kearney & Trecker Corp., Advertising Department, 11000 Theodore Trecker Way, Milwaukee, Wis. 53214.

Summary: This film tells the story of the TRI-D milling head. It shows how this machine produces many geometric shapes in metal and in a single setup, using only simple arithmetic.

Manufacturing with Milwaukee-Matic (1958) 16 mm., sound, 17 min., b & w. Kearney & Trecker Corp.

Summary: This film covers the complete machining of a part, performing all operation—milling, drilling, boring, and changing tools—automatically. The entire process is commanded by tape control.

New Servo-Controlled Contour-Matic Machine for Increased Profits. (1964) 16 mm., sound, 10 min., color. The DoAll Co., Film Librarian, 254 N. Laurel Ave., Des Plaines, Ill. 60016.

Summary: This film illustrates a revolutionary new control system for power fed Contour-matic Band machines. The new system utilizes a very sensitive servo-valve to maintain constant feed rate for the most efficient machining of all materials. (Not cleared for TV.)

Numerical Control—Solid State. (1961) 16 mm., sound, 10 min., color. UNIVAC Division, Sperry Rand Corp., Graphic Services Department, Sperry Rand Building, New York, N.Y. 10010.

Summary: This film presents a demonstration of automatically controlled machine tools used in the manufacture of metal parts for the aircraft industry. It shows how the Univac Solid State Computer prepares control media for machine tools, making it possible to fabricate highly complex parts faster and more economically than could be done with conventional tooling methods. (Cleared for TV.)

One Hoe for Kalabo. 16 mm., sound, 27 min., color. National Machine Tool Builders Association, 2139 Wisconsin Avenue, Washington, D.C. 20000.

Summary: From U. S. Industrial Plant to African village . . . the story of how machine tools have given dignity and power to human labor and world civili[illegible]

Profit Robbers, The. (1963) 16 mm., sound, 15 min., color. Kearney & Trecker Corp., Advertising Department, 1100 Theodore Trecker Way, Milwaukee, Wis. 53214.

Summary: This film depicts the machining center of the future. It is a numerically controlled, five-axis, milling, drilling, boaring, reaming, and tapping machine tool. Tools are changed automatically, and work-pieces are presented to the horizontal spindles in five planes.

Quality and Cost. 16 mm., sound, 15 min., color. Kearney & Trecker Corp., (see above)

Summary: This film is the story of the ever present problems of manufacturing—quality and cost. It si.ows how to produce quality at minimum cost and deals primarily with the use of special purpose production machine tools.

Researches in High Speed Milling. 16 mm., silent, 20 min., b & w. The Cincinnati Milling Machine Co., Advertising Department, 4701 Marburg Avenue, Cincinnati, Ohio 45200.

Summary: This film presents the story of high speed carbide milling, beginning with a simple exposition of the meaning of positive and negative rake in metal cutting tools, the various angles involved, and the mechanism of chip formation itself. The slow motion scenes are photographed at the rate of 3,000 pictures per second.

Rotomatic Positioning Table. (1962) 16 mm., sound, 18 min., color. LaPointe Machine Tool Co., Educational Department, 34 Tower Street, Hudson, Mass. 01749.

Summary: This film describes the newest LaPointe production, the Rotomatic Positioning Table, and its adaptation to drilling machines and milling machines. This machine is shown with numerical, electro-mechanical, or manual control.

Tape-O-Matic. (1962) 16 mm., sound, 13 min., color. Pratt & Whitney Co., Inc., Advertising Department, Charter Oak Boulevard, West Hartford, Conn. 06090.

Summary: This film shows how numerical control can be used in every machine shop in the country. It tells the complete story of P & W's low cost Tape-O-Matic drilling machine. (Cleared for TV.)

3-Dimensional Drafting. 16 mm., sound, 26 min.,

color. Ridgway's of New York, Inc., 110 West 42nd Street, New York. N.Y. 10010.

Summary: This film presents the interesting features and phases of the "Instru-master" technique of producing three-dimensional, one-view drawings; it shows illustrations and drawings being made and explained.

Tracer Control in Action. (1953) 16 mm., sound, 36 min., color. George Gorton Machine Co., Attention: Miss Marjorie R. Allert, Assistant Advertising Manager, 1321 Racine Street, Racine, Wis.

Summary: This film is a technical exposition of tracer control applications with pantograph machines and die and mold duplicators, including "automated" production applications, photographed under actual shop conditions. It includes material on profiling, profile grinding, and electric arc etching.

Uses and Abuses of Twist Drills. 16 mm., sound, 26 min., b & w. Cleveland Twist Drill Co., Mr. W. E. Wenger, Advertising Manager, P. O. Box 6656, Cleveland, Ohio 44110.

Summary: This film portrays and demonstrates the various types of twist drills. It also shows the applications of these drills and the care that should be given them. (Not cleared for TV.)

Due to the change in the technology many new films are becoming available.

APPENDIX A

INSTRUCTOR'S LESSON PLAN

Related Technical Information

Unit_____
Lesson_____

Subject

Review of Machining Methodology

Objectives

Teaching Aids

Films, feed and speed tables, plan sheet for NC, and mockups

Materials

Blueprint of a part, sample part machined

References

Feirer and Tatro. *Machine Tool Metalworking.*
Metal Cutting Tools Institute. *Metal Cutting Tool Handbook.*
U. S. Department of Commerce. *Machining Data* (AD425000).
Manual of machine tool to be used

I. PREPARATION (of the learner)
- Review metal cutting processes
- Review sequencing of cutting operations
- Calculate feeds and speeds for various machining processes in several materials

II. PRESENTATION (of the information)

Instructional Topics	Things to Remember to Do or Say
Machining principles	Preview films
Metal removal	Call attention to specific machining operations
Feed rate calculation	Sequencing of machining
Speed rate	Rigidity of support
NC machining	Time of process
Programing	Cost of process per part
	Feed rate—dependent on materials, conditions, finish
	Table interpretation for several materials—alloy steel = CRS cast iron aluminum
	Speed rate factors affecting cutting tool material coolant or dry
	Movement system
	Accuracy
	Machining on paper
	Control system flexibility

III. APPLICATION (drills, illustrations, analogies, oral questions or assignments)
- Drilling—calculate feed and speed rate for a 1" H.S.S. drill in cast iron, alloy steel, aluminum.
- Which operation should be done first? Second? How should this part be held?
- What kind of tooling should be used to change rapidly yet hold accuracy?
- When should coolant be used?

IV. TEST (final check on the student's comprehension of material presented)
- How would you sequence the operations of a part (blueprint and/or part available) to get the fastest machine time yet hold the accuracy required? Select the tools and machine. Support the selection of your process with objective criteria.

Suggested Reading for Student:
The Next Lesson Is: Holding Devices

5527

APPENDIX B

SAMPLE LESSON PLAN FOR UNIT III
REVIEW OF MACHINING METHODOLOGY

Training Time

Classroom, 2 hours; laboratory, 1 hour

Objectives

To review the machining principles
To acquaint the student with the selection of speeds, feeds, and rate of machining
To select the sequence of operations
To select holding devices

Materials

Speed and feed charts, chalkboard, chalk eraser, films, reference materials, tool selection form and/or demonstration

Unit Outline

A. Basic machine tools—Film–*One Hoe for Kalabo*–sound, color, 27 min.
   1. Drill press
   2. Milling machine
   3. Shaper—planer
   4. Lathe
   5. Grinder
   6. Punching—blanking
   7. Forming

B. Machining principles
   1. Internal
      a. Drilling—Film–*Tape-O-Matic*–sound, color, 13 min.
      b. Reaming
      c. Boring
      d. Counter functions
         (1) Counter boring
         (2) Counter sinking
         (3) Spot facing
      e. Tapping
      f. Slotting
      g. Punching, piercing, blanking
      h. Forming
      i. Broaching
   2. External
      a. Turning
      b. Facing
      c. Angle turning
      d. Form turning
      e. Threading
      f. Slotting
      g Milling—hobbing
         (1) Keyways
         (2) Splines
         (3) Gears
      h. Surfacing
         (1) Mill
         (2) Shaper—planer
         (3) Grinder
      i. Forming
   3. Speeds and feeds—Machine Data–By Process (Drilling, Milling, Boring)
      a. Material machining
      b. Cutting material
      c. Condition and size of machine
      d. Holding device
      e. Power source
      f. Wet or dry
      g. Rigidity of foundation structure
      h. Calculation of speeds and feeds
      i. Table referencing of speeds and feeds
      j. Cutting fluids

C. Holding devices
   1. Tool
      a. Chucks
      b. Sleeves
      c. Holders
      d. Tapers
   2. Work
      a. Vises
      b. Clamps
      c. Jigs and fixtures
      d. Magnetic chucking
      e. Vacuum chucking

D. Tooling—*Metal Cutting Handbook*–Drill pp.1-64, Mill pp. 475-658, Reaming pp. 165-256
   1. Standard
      a. Size
      b. Material
         (1) High speed
         (2) Carbide
         (3) Oxide

6528

c. Conditioning
d. Maintenance

2. Preset tooling—Manual for the machine tools and controls used
   a. Methods of presetting
   b. Instrumentation used
   c. Purpose of preset tooling
   d. Function

E. Movement systems—Manual for the machine tool used
1. Mechanical
2. Pneumatic
3. Hydraulic
4. Electrical
5. Feedback systems
6. Flat surfaces
7. Dovetail—machine slide system
8. Antifriction devices

F. Operational sequencing—Film–*Manufacturing with Milwaukee-Matic*–sound, b & w, 17 min.
1. Mounting
2. Holding (part and tool)
3. Tool selection
4. Referencing
5. Speed and feed selection
6. Inspection
   a. Size
   b. Shape
   c. Finish
   d. Position to reference
7. Auxiliary functions

Suggested Activities

Review machining principles by live demonstration or films

Demonstrate the sequencing operation entry on a tool sheet

Demonstrate speed and feed calculations

Introduce holding devices

Assist student in independent work

Suggested Assignment

Complete the tooling sheet, including speed and feed calculations, from the blueprint of the previous lesson

Study holding devices and coordinate referencing

Continue the study of the glossary of terms

APPENDIX D
SUGGESTED LABORATORY FLOOR PLAN

Figure VIII-2. Laboratory floor plan.

APPENDIX E
SUGGESTED LIST OF CLASSROOM EQUIPMENT

Classroom 30′ x 40′		Estimated costs*
8	Tables, 4′ x 8′	$ 800.00
24	Chairs	400.00
2	Drafting tables, 3′ x 5′	300.00
2	Drafting machines, 24″ arms, w/scales	300.00
4	Triangles, 30–60 degrees	8.00
4	Triangles, 45 degrees	8.00
10	Scales, inquiring	15.00
2	Pencil sharpeners	10.00
1	Book storage	100.00
1	Blueprint storage	100.00
1	File	100.00
1	Instructor's desk	120.00
1	Chart stand	10.00
1	16-mm. projector & screen	500.00
1	Overhead projector	250.00
1	Tape punching & verifying equipment	3,600.00
1	Tape storage	100.00
1	Tape splicing equipment	54.00
2	Drafting sets	30.00
1	Planning area table	100.00
1	Blackboard, 20′	200.00
1	Bulletin board, 10′	60.00

*Costs in appendixes E, F, and G were estimated as of 1967.

5531

APPENDIX F

SUGGESTED LIST OF LABORATORY EQUIPMENT

Laboratory		
20′ x 30′		
1	N/C machine TAPE-O-MATIC	
	Model B, N/C machining center	$20,995.00
	Model B positioning table (without head)	11,950.00
	OPTIONAL FEATURES—MODEL B	
	Three-digit operation Number read-out	995.00
	Depth indicator and mounting Brackets (Standard #4 M. T. drilling spindle)	160.00
	Depth indicator and mounting Brackets (boring and/or milling type spindles)	160.00
	Extra drum for six (6) extra depths	230.00
	Four-inch column riser for Model B	440.00
	Auto-transformer (8KVA)	300.00
	OPTIONAL ACCESSORIES	
	Coolant system	295.00
	Work-illumination light	27.00
	Tool cabinet	275.00
	Tape tumble box	40.00
	Extra reel	25.00
	Book of angular indexing tables	11.00
	Tape roll	44.25
	TAPE-O-MATIC tape processing sheets	2.25
	WORK LOCATING AND CLAMPING DEVICES	
	Accuset zero locator	395.00
	Accuset for special boring spindle	395.00
	Nesting block set	195.00
	Universal 3-jaw chuck	360.00
	Set of blocks and magnets	147.00
	Setup fixtures set	165.00
	TOOL HOLDING DEVICES	
	Quick change chuck, 1/32″–1/2″ Cap. (#3 M. T.)	49.50
	Quick change chuck, 3/8″–3/4″ Cap. (#4 M. T.)	22.30
	Jacobs chuck, 3/16″–3/4″ Cap. (#4 M. T.)	22.30
	Keyless chuck, 1/32″–1/2″ Cap. (#3 M. T.	25.00
	Keyless chuck, 0–5/16″ Cap. (#3 M. T.)	21.90
	Keyless chuck, 1/8″–5/8″ Cap. (#4 M. T.)	29.75
	Quick drift (#4 M.T.)	15.75
	Drill speeder, 6 1/4 : 1 (#4 M. T.)	114.75
	Tapping attachment, #00–#10 Cap. (#4 M. T.)	103.75
	Tapping attachment #4–5/16″ Cap. (#4 M. T.)	168.75
	Tapping attachment #10–5/8″ Cap. (#4 M.T.)	228.75
	Tapping attachment stop post, for MODEL B	40.00
	MAINTENANCE EQUIPMENT AND SPARE PARTS	
	Maintenance kit	495.00
	Proboscope	1,370.00
	Symmetry-quadrature test meter	150.00
2	Tool storages	160.00
2	Holding device storages	160.00
1	Tool setting equipment	300.00
1	Work bench	120.00
1	Tool cart	84.00
	Miscellaneous equipment	1,000.00

APPENDIX G

SUGGESTED LIST OF SUPPLIES

3 rolls	Standard punch tape	$100.00
	Film rental & postage	50.00
	Paper, pencils, erasers, etc.	50.00
	Teaching materials	50.00
	Book & manuals	200.00
	Tools & parts	200.00
	Miscellaneous	300.00

APPENDIX I
TEACHING TIPS

There is no one good, all-purpose teaching technique or procedure. It is necessary to utilize a variety of methods to get across different facts and ideas.

Talking is not teaching.

Listening is not learning.

Class Discussion—Introduce the problem in a stimulating manner, keeping the topic before the group at all times by keeping the comments relevant to the subject. Each member must assume responsibility for an effective discussion. Summarize at the end of each unit to stress the basic or important principles.

Resource Persons—Prepare the class for the topic to be covered. Give the resource person a topic and a length of time to present his topic. Allow time for questions and answers.

The student will learn faster, remember better, and apply the information more fully and skillfully if you keep in mind the following points:

1. If the student can see the target clearly, the potential of hitting it is good. Be sure the learner knows what is expected of him. A systematic, carefully planned course and unit outline, in which the desired goals or purposes are carefully differentiated into information, learning processes, skills, and values is most helpful to learning.

5547

2. We learn when we practice. Effective practice requires a model to be imitated. The student will use his faculties for discovering new facts, for critical thinking, and for discriminating judgments if he sees the instructor doing this. The student should be urged to practice skills in the manner in which he wishes to use them on the job.

3. Instructors teach for transfer and application. A new principle learned will have many applications and associations if it is within the experience of the student. An ounce of experience is worth a ton of theory, simply because it is only as an experience that a theory or principle has significance.

4. Motivation factors are important to learning. Nothing motivates like success. Rewards are strong motivational factors. Mature students learn to be motivated by both present and remote rewards. Praise is better than scolding.

5548

5. Learning is increased by knowledge of results. The beginning golfer who got a hole-in-one asked his instructor, "What did I do right?" Do your comments (feedback) lead him on or make him fear the results?

6. We learn best what is meaningful. Our most meaningful experiences are those which help us reach our goals. No occurrence is an event for us unless it has bearing or significance for our purposes.

7. Most people never reach their potential. High motivation and superior teaching help to bring out the best in all of us.

8. Learning is improved when organized for sequential and cumulative effects. Each student must skillfully file his fund of information so that he can quickly put his finger on whatever he needs to know.

Treat your students as you, an adult, wish to be treated.

Characteristics of Students

C Come to class with opinions on various subjects

H Have a remarkable ability to learn things thoroughly

A Appreciate a systematic, business-like procedure in the learning process

R Require subject matter designed to meet their needs

A Acutely desire participation in laboratory work

C Contemplate consideration as adults

T Traditionally have firmly developed aptitudes and attitudes

E Expect practical application of the knowledge they are gaining

R Reveal the richness of their lives to others

I Invite informality and variety

S Seek to upgrade their social and economic status

T Take an interest in having their experiences co-related with new material

I Insist on full use of classroom time

C Crave participation in class activities

S Seek "give and take" in discussions

ABSTRACT - This teaching guide on animal nutrition was compiled by agriculture education instructors in cooperation with the Department of Agricultural Education at Montana State University. Topics are: (1) Introduction to Animal Nutrition, (2) How Animals Use Their Feed, (3) How Nutrients Are Supplied to Livestock, and (4) Balancing the Ration. The guide is in outline form with objectives for each section. (GB)

Table 6: Net Energy Content of Feeds Expressed on a 90% Dry Matter Basis Unless Otherwise Indicated - 38

INTRODUCTION

Note To Teachers In Planning the Animal Nutrition Unit: Plan Early To:

1. Conduct an animal feeding experiment. A procedure for an experiment which has been conducted with chickens is included on pages 39,40,41 & 42. For additional information, the bulletin "Animal Feeding Demonstrations for the Classroom" may be purchased for 30¢ from the National Dairy Council, 111 Canal Street, Chicago, Illinois 60606.

2. Field trips should be incorporated in conjunction with your animal science class.
   Suggestions:
   - Outstanding feeding operations in the area
   - -- range
   - -- dairy
   - -- poultry
   - Feed mills
   - State programs on feeding such as
   - -- MSU Annual Feeders' Day or
   - -- local meetings with University or company nutritionists

3. Film strips, slides, etc. on nutritional subjects - See Montana Vocational Agricultural Education Course of Study suggested list of references and resources.

4. Examples of different feeds brought to the classroom such as grains, hays, silages, etc. are important visuals.

5. Have local grain, hay, and silage samples sent to MSU for analysis through your county extension office.

ANIMAL NUTRITION

OBJECTIVES -- To provide a basic understanding of animal nutrition with practical application to animal feeding.

I. INTRODUCTION TO ANIMAL NUTRITION

Discoveries in the basic sciences as chemistry, physics physiology, radiation-biology, have increased the knowledge base of applied animal nutrition. For this reason it is vitally important that persons feeding animals keep abreast of up-to-date feeding practices. This is particularly important if today's livestock feeder is to remain competitive.

A. Goals of animal rearing are to assure:

1. Health - Healthy animals are much more economical to raise and are more efficient producers.

2. High production - To economically produce the maximum milk, wool, growth, calf crop, eggs, etc.

3. An adequate income - To provide the necessities and some of the luxuries of life.

4. Satisfaction in work accomplished.

B. Factors of major importance in attaining these goals:

1. Feeding - Supplying the animal with the quality and quantity of all required nutrients in the most satisfactory and economical manner.

2. Breeding - Maintaining a breeding program that will result in the maximum production of top quality produce (milk, meat, wool, eggs, etc.)

3. Control of parasites and diseases - It has been conservatively estimated that these cost American Farmers 2.8 billion dollars annually.

4. Other management practices - Maintaining records, handling and marketing livestock, etc.

C. The nutrition of farm animals is important because of the following:

1. Economy - Feed cost probably represents the largest single expense in animal production.

a. Dairy Cattle - up to 60% of the cost of whole milk is feed costs.

b. Hogs - 80% of the total cost of producing pork.
c. Beef - 80% of the cost (not including purchase price) of finishing cattle.
d. Poultry - 50 to 70% of the total production cost.
e. Sheep -

2. Production Efficiency - A diet deficient in one or more of the essential nutrients can drastically reduce the ability of the animal to use other nutrients. For example, low protein stunted growth (disregarding other nutrients supplied) Optimum production depends upon feeding the animal according to age, purpose, and species requirements.

3. Dietary Health - Good feeding practices can prevent or help prevent many nutritional related diseases such as: bloat, nitrite poisoning, compaction, ketosis, anemia, colic, flourosis, founder, goiter, heaves, rickets, etc. Unsanitary feeding practices also spread diseases.

4. Market for feeds - Feed is sold through animal products.

D. Animals need feed to:

1. Maintain their bodies to perform the work of respiration, digestion, circulation, etc.

2. Replace and repair tissues which are constantly being broken down.

3. Produce meat, milk, eggs, wool, and do work.

4. Promote growth. Maximum feeding during growth does not necessarily give optimum production later in life. For example, beef and dairy heifers fed at 130% recommended feeding levels produced less milk than those given 100% of the standards.

5. Develop the young fetus, produce viable young, and settle upon breeding.

E. Definitions needed to understand nutrition.

Alfalfa Meal - is the product obtained by grinding entire alfalfa hay without the addition of any alfalfa stems, alfalfa straw or foreign material or the removal of any of the leafy portion. Fiber content should not be higher than about 29 to 30%.

Amino Acids - different nitrogenous compounds which are the fundamental structural units of proteins. (The amino acids may be any one of a class of organic compounds containing the amino group ($-NH_2$) and the carboxyl group (-COOH) attached to a carbon skeleton of varying size. A few amino acids (methionine, cystin) also contain sulfur.)

5558

Calorie - the amount of heat required to raise 1 quart of water 1 degree centigrade.

Carbohydrates - the chief source of energy and heat in the food of animals. This group of substances includes the sugars, starch, cellulose and other compounds. Carbohydrates are composed of three chemical elements - carbon, hydrogen, and oxygen.

Carotenes - yellow-colored substances that animals convert into vitamin A.

Cellulose - cellulose and related compounds make up the cell walls of plants. It is more complex in molecular structure than starch; very insoluble and resistant; it can be digested by animals only through the action of bacteria, as in the rumen of cattle or sheep.

Concentrates - feeds that are low in fiber and high in total digestible nutrients which may be low in protein or rich in protein.

Digestion Coefficient - percent of each nutrient digested in a feed.

Enzymes - organic compounds which bring about changes in other organic compounds without themselves being changed or broken down.

Essential Amino Acid - those amino acids which cannot be synthesized in the body from other substances or which cannot be made in sufficient amounts.

Fats and Oils - are alike in composition and properties. Fats, however, are solid at ordinary temperatures while oils are liquid. Fats furnish 2.25 times as much heat or energy per pound as carbohydrates

Heat Increment - the additional amount of heat which is produced in the body following and because of consumption of food.

Kilocalorie (KCAL) - 1,000 calories. Megacalorie.

Megacalorie (MEGCAL) - 1,000 Kilocalories. The term used most with Net Energy values. One Megcal also is equal to one Therm.

Metabolism - changes which take place in the nutrients after they are absorbed from the digestive tract.

Mineral - inorganic compounds occurring naturally as a product of inorganic processes.

Net-energy value - caloric energy in a feed available for maintenance and production. Determined by subtracting the energy lost in the feces, urine, combustible gases, and heat increment from the gross energy of the feed.

Nitrogen - free extract made up of the more soluble part of the carbohydrates. It includes starch, the sugars, and the more soluble portions of the carbohydrates.

NPN - non-protein nitrogen; compounds such as urea or biuret.

NRC - (National Research Council) periodically a committee on Animal Nutrition reviews research reports and establishes standards for the different species based on recent research. These recommendations are printed, published, and are available for a nominal fee from the National Academy of Sciences, National Research Council, 2101 Constitution Avenue, N.W., Washington, D. C. 20418

Nutritive ration - the ratio, or proportion between the digestible protein and the digestible non-nitrogenous nutrients (including fat multiplied by 2.25)

Nutrient - a food constituent or group of food constituents of the same general chemical composition, that aids in the support of life.

Digestible Nutrient - that portion of a nutrient which may be digested and taken into the body.

Total Digestible Nutrient (TDN) - the sum of all the digestible organic nutrients; protein, fiber, nitrogen-free extract and fat. (X2.25)

Protein - proteins are complex compounds. In plants and animals there are many different proteins which differ from each other in composition. Each molecule of protein is composed of different nitrogenous compounds called amino acids.

Ration - the feed allowed for a given animal during 24 hours, whether it is fed at one time or in portions at different times.

Balanced Ration - a ration which furnishes the several nutrients in such proportion and amount to properly nourish an animal for 24 hours.

Maintenance ration - the amount of food needed to support the animal, when doing no work and yielding no product.

5560

Starch - composed of many molecules of glucose. Starch is the chief carbohydrate in plants and therefore very important in stock feeding.

Soiling Crops - green forage crops that are cut and fed in fresh condition to stock.

Supplements - a feed or a feed mixture used with another feed to improve the nutritive balance or performance of the total ration.
Supplements can be:
a. fed undiluted as a supplement to other feeds, or
b. offered as free choice with other parts of the ration separately available, or
c. further diluted and mixed to produce a complete feed

Toxicity - an imbalance in the system due to a shortage or over supply of a nutrient, which may be sickening or cause death. Veterinarians qualify the toxicity level by mild or acute.

Therms of net energy - a therm is a unit of measuring heat; it is the amount of heat required to raise the temperature of 1,000 kilograms of water 1 degree centigrade or to raise the temperature of 1,000 lbs. of water about 4 degrees fahrenheit. One therm is equal to 1,000 kilocalories. See MEGCAL.

Vitamin - an organic nutritive required in very minute amounts.

Roughages - feeds that are high in fibers and; therefore, low in total digestible nutrients.

II. HOW ANIMALS USE THEIR FEED

A. General Composition of Body - different species are similar in composition, expressed in a dry, fat free basis but varies on total basis with kind and ages of livestock.

1. Water - content decreases with age (i.e. 95% in embryo - 50 to 60% in mature animals).
   a. The nutritional state of the animal and the fat it has stored accounts for the decrease of water stored in the animal.
   b. Blood plasma contains 90 to 92%, muscles 72 to 78%, bone 45%, and teeth enamel 5% water.

2. Protein - on a fat-free basis, the average body contains 21.6% protein.

3. Ash - on a fat-free basis, the body contains 5.3% ash (mineral matter). The protein and ash content do not vary as much as water and fat. The percentages of the principal mineral constituents of the body are indicated in the following table:

Element	Percentage
Calcium	1.33
Phorsphorous	0.74
Sodium	0.16
Potassium	0.19
Chlorine	0.11
Magnesium	0.041
Sulfur	0.15

4. Carbohydrates make up less than 1% of body at any given time. Carbohydrates are stored in the form of glycogen. Excess carbohydrates are stored as fat.

5. Fats - fats are stored under the skin and around the intestines, kidneys, and other organs. Every cell contains some form of lipids.

B. The relationship of nutrients in the feed to body functions of animals.

1. Six nutrients are considered essential to an animal's growth and development.

   a. Proteins are found in every cell and are the principle constituents other than water for the organs and soft structures of the body such as muscles, tendons, and connective tissues.

b. Carbohydrates are the main source of energy and heat for animals.

c. Fats are used for energy and heat when needed. Fats contain 2.25 times as much energy as carbohydrates. Three fatty acids (arachidonic, linoleie, linolinie) are considered essential.

d. Water - water is the largest single constituent of nearly all living plant or animal tissues, and also performs exceedingly important functions.
   1) Water makes up over 50% of body composition, and many tissues contain 70-90% water. A loss of 10% of body water could cause death.
   2) Water facilitates cell reaction-product of reaction.
   3) Aids in digestion and transfer of metabolic products.
   4) Regulates temperature of animals.
   5) Special body fluids-(Lubricates joints, cussions eye, etc.)
   6) Helps hold body shape.

e. Minerals - minerals though present in most plants in relatively small amounts, are essential for animal growth.
   1) Aside from calcium, the elements occur as fractions of a percent only but are absolutely essential to life.
   2) Calcium is present almost entirely in the bones and teeth as phosphate and hydroxide.
   3) Phosphorous, which combines with calcium to form the skeleton accounts for 80% of the body supply. The remainder is distributed in combination with proteins, fats, and as inorganic salts.
   4) Sulfur occurs throughout the body as part of protein molecules.
   5) Sodium, potassium, and chlorine are present almost entirely as inorganic salts in body fluids.
   6) Magnesium is present in the bones, but is also found distributed throughout the body.
   7) Iron is an essential constituent of the hemoglobin in blood and is also found in body organs and tissues.
   8) Iodine, copper, zinc, manganese, cobalt, selenium, and probably florine and chromium are essential for stuctural or metabolic purposes.
   9) Boran, silicon, bromine, aluminum, nickel, and arsenic occur normally in the body though their exact function is not known.

f. Vitamins regulate body functions.
   1) Keep the mucous membranes healthy.
   2) Prevent respiratory diseases.
   3) Prevent nervous disorders.
   4) [redacted] bone deformity.

[redacted]

5) Prevents reproduction disorders.
6) Helps blood clotting.
7) Prevents muscle disorders.

C. Major plant and animal differences which affect livestock feeding.

1. All animal life depends on plants. Plants contain the same substances as animals but the amounts present are very different.

2. Differences:
   a. Animal cell walls are made of protein whereas plant cell walls are made of cellulose and are more rigid.
   b. Animals store food as fats.
      Plant reserve food as carbohydrates.
   c. Animals utilize plants as food.
      Plants use energy supplied from sun to make its food.
   d. Animals can move to obtain food.
      Plants are rooted (anchored) to one spot.
   e. Animal dry matter is mostly protein.
      Dry matter of plants is mostly carbohydrates.
   f. There is more calcium in an animal.
      Plants are much lower in calcium.

D. Necessary processes required to utilize feeds and thereby sustain life.

1. Digestion and absorption.
   a. Food is broken down into relative simple chemical compounds that are mostly soluble in water and are readily absorbed through the membranes which line the digestive system.
      The digestive system includes the mouth, gullet, stomach, small and large intestines.
   b. Digestion starts in the mouth.
      1) Food is ground (mastication) by the teeth and moistened to be swallowed. A cow may secrete 125# of saliva in 24 hours.
      2) Very little digestion takes place in the mouth as the food is there for such a short time. Carbohydrate digestion may start with saliva enzyme action but the acidity of the stomach (1.5 - 3.0 pH) stops the enzyme action.
   c. Gullet (Esophagus) - Passageway to the stomach or gizzard in a chicken.
   d. Stomach - 2 types (complex and simple)
      1) The simple stomach is found in man, dog, pig, and carnivorous animals.
         (a) Protein digestion starts in the stomach with enzyme action. Broken into polypeptides.
         (b) Hydrochloric acid aids digestion in the stomach.
         (c) Very little carbohydrate or fat digestion takes place in the sto[redacted]

2) The complex (compound) stomach is found in cattle and sheep.
   (a) Ruminants have 4 compartments or stomachs (rumen, reticulum, omasum, and abomasum) which may hold over 250 quarts. In cattle more than 50% of the mature animals digestive tract capacity is in the rumen and reticulum. This area is needed so bacteria and protazoans may break down the cellulose and other complex carbohydrates. Food is regurgitated from the reticulum to be rechewed and reswallowed. The finer particles are constantly being moved on through the 3rd (omasum) and 4th (abomasum) compartments.
   The abomasum has enzymes like those found in the stomach of monogastric animals.
   (b) Proteins are digested and resynthesized by the bacteria in the rumen and passed to the abomasum where they are digested.
   (c) Carbohydrates are broken down by micro-organisms to meet their own needs. During the process volatile fatty acids are produced, absorbed and used as an energy source by the animal.
   (d) The micro-organisms synthesize the B-complex vitamins which can be absorbed and utilized by the animal.
3) Small Intestine.
   (a) The small intestine in cattle is about 160 feet long and 60 feet long in swine. It is lined with villi which protrude from the intestinal wall thereby enlarging the area in which the nutrients come into contact. Most absorption of nutrients occurs in the small intestine.
   (b) Most of the proteins (dietary and microbial), fats, and carbohydrates are broken down by enzymes and absorbed in the small intestine. This is also the site of mineral and vitamin absorption.
   (c) Bile secreted into the small intestine helps break down the dietary fats.
4) Large Intestine - One important function of the large intestine is to absorb water and stop dehydration. Digestion of nutrients continues in the large intestine to a smaller degree.
   (a) That part of the large intestine next to the small intestine called the cecum is greatly enlarged in horses and to some degree in swine. There is bacteria present in the cecum and large intestine of horses to help break down complex carbohydrates which are found in roughages.

5565 4822

(b) The purpose of the colon is to regulate the passage of the feces which contain undigested food and other body wastes.

E. Transportation of nutrients - arteries take blood from the heart and veins bring it back. At the end of the small arteries are capillaries which connect the arteries to veins. The nutrients pass through the capillary walls to the blood and are carried where needed. Waste products are also passed through the capillaries.

1. Blood - the composition of blood is very important as it is the medium by which nutrients are carried throughout the body and by which metabolic waste products are removed. Blood makes up 5 to 10% of the body weight. Corpuscles make up 35 to 40 percent of the blood. About one-third of the solid matter of the red corpuscles is the iron containing protein hemoglobin which is responsible for transporting oxygen and carbon dioxide. The plasma contains 10% of solids, more than one-half of which is protein. The remainder consists principally of fatty substances, sugar, non-protein nitrogen compounds, and inorganic salts.

2. Lymph is a nearly colorless fluid that bathes the body cells and fills the space in between them. Nutrients and oxygen pass to the cells in lymph and carbon dioxide and waste products are transferred to the veins through the lymph.

3. Glucose is withdrawn from the blood and temporarily stored as glycogen in the liver. (3 to 7% of the liver weight is glycogen). The glycogen is converted to glucose as the body needs it to nourish the various body tissues.

F. Other Process - Hormones control and regulate many of the body functions and are important in metabolism. An example is thyroxine which regulates the rate of metabolism.

III. HOW NUTRIENTS ARE SUPPLIED TO LIVESTOCK

A. Classification of Feeds - When feeds are used to make up diets or feed mixtures they usually have a specific purpose depending upon their chemical make-up. In the NRC classification feeds are divided into eight main groups:

1. Dry forages and roughages.
   Forages or roughages are low in net energy per unit weight, usually because of their high fiber content though sometimes because their water content is high. According to the NRC nomenclature and also according to the Canada Feed Act products that in the dry states contain more than 18 percent crude fiber are classified as forages and roughages. Thus, in addition to forages, such products as oat hulls, alfalfa meal, dried beet pulp, brewers grains (some samples), and rice bran, which are sometimes listed among the concentrates are included in this group. Few roughages contain as much as 1,200 kilocalaries digestable energy per lb. (16 percent TDN), and the average is not far from 1,000 kcal per lb. (50 percent TDN). Examples are:
   - Hay
     - Legume
     - Nonlegume
   - Straw
   - Fodder (aerial pt w ears w husks, or heads)
   - Stover (aerial pt wo ears wo husks, or heads)
   - Other products with more than 18 percent fiber
     - Hulls
     - Shells

2. Pasture, range plants, and forage fed green.
   Included in this group are all feeds not cut and cured. For example: all feeds cut and fed green or feeds cured on the stem, such as dormant range plants. The term "fresh" is a common term used even though the feeds may be dry and weathered when consumed.

3. Silages
   Characteristic examples are:
   - Corn plant (including plant parts and grain)
   - Legume
   - Grass

4. Energy or basal feeds
   Products with less than 20 percent protein and less than 18 percent crude fiber. The term "basal feeds" and "energy feeds" are often used interchangeably.
   Characteristic examples are:
   - Cereal grains
   - Mill by-products
   - Fruits
   - Nuts
   - Roots

5567

Fruits, nuts, and roots are classed as energy feeds because in making up diets and feed mixtures they are included primarily to supply energy. However, many of the fruits and some roots are excellent sources of vitamins and minerals for humans.

5. Protein supplements
   Products which contain 20 percent or more protein.
   Common sources are:
   - Animal by-products
     - Tankage
   - Marine
     - Fish Meal
   - Avian by-products
     - Feathers, litter, and feces
   - Plant
     - Cotton meal
     - Soybean meal
     - Linseed meal
     - Mustard meal

6. Mineral supplements
   See p.25-27 for explanation and discussion of minerals

7. Vitamin supplements
   See pages 27 - 32 for listing of sources and a discussion of vitamins.

8. Additives are various compounds added to nutrients which do not, of themselves, have nutritional value but may enhance growth, increase rate of gain, increase disease resistance, add coloring to animal products, may increase palatability, etc.
   Examples are:
   - Antibiotics
   - Flavors
   - Hormones
   - Medicants

B. Utilizing pasture and range land effectively for livestock feed.

1. Feeding value of pasture and range grasses.
   See pages 644, 636, 566, and 550 of Morrison's Feeds & Feeding, Ninth Edition.

2. Effect that growth and maturity has on the feeding value of pasture and range grasses.
   - The protein content decreases with maturity.
   - The T.D.N. content decreases with maturity.
   - The lignin content increases with maturity.
   - The vitamin content, particularly pro-vitamin A (carotene), decreases with maturity.
   - The palatability usually decreases with maturity.

In summary, the maturity is the most important factor affecting chemical composition and digestibility of a plant.

3. Economical value of utilizing pasture and range land.
   a. Pasture
      Dairy: High energy concentrates and trace mineral salts in the ration are needed to supplement pasture.
      Beef: Trace mineral salts plus good pasture will usually meet the animal's needs.
      Sheep: Trace mineral salts plus good pasture will usually meet the animal's needs.
      Horses: Possibly need trace mineral salt in addition to pasture.
      Swine: Can use only limited amounts of pasture feed.
      Poultry: Cannot be economically supplied on a commercial basis, but may be met on a common small farm flock for only home use.
   b. Range
      Dairy: Impractical and uneconomical.
      Beef: (a) Usually sufficient except for some minerals to meet the needs of beef cattle if phosphorous and iodized salt supplements are fed free choice.
      (b) Advisable to use a protein supplement on winter range.
      Sheep: Same as beef.
      Horses: Same as beef and sheep.
      Swine: Uneconomical
   c. Cost/pound of different nutrients:
      1) Beef, sheep, and hourses - pasture and range are the most economical sources of feed for these species.
      2) Dairy, swine, poultry - must be supplemented extensively with grain concentrates due to digestive systems and energy requirements for production.

4. Factors which make for efficient utilization of pastures and range land.
   Range and Pasture
   a. Proper Species:
      Preferred species of grasses according to species of livestock.
   b. Fertilization:
      Improves production quantity and quality.
   c. When to graze - Range
      Regulate grazing of range lands by percentage of decreaser and increaser plants.
      Pastures: See figure 1, next page entitled "Pasture Management for Maximum Profit with Proper Capacity/Acre".

FIGURE 1

5570

d. Small Grains may be used as early spring pasture to defer use permenant pastures and range.

e. Management Practices which improve pasture and range utilization are:

Clipping
Weed control
Fertilization
Irrigation

C. Utilizing harvested forages for feeding livestock.

1. Types of forage examples are:

a. Hay - forages cut, cured, and stored for later use by livestock.

1) Legume - alfalfa, clovers, soybeans, sanfoin.
2) Grass - bromegrasses, wheatgrasses, timothy, native grasses.
3) Grass and legume mixes - combinations of the above grasses and legumes.

b. Silage - forage crops cut, chopped green, and stored uncured in a silo to create a desired fermentation.

1) Grasses and small grains.
2) Legumes
3) Corn

c. Soilage - forage crops cut and fed in fresh condition to livestock.

1) Legumes
2) Grasses

d. Others - straw, fodder.

2. The value of forage will depend on the time of cutting, length of curing period, losses due to bleaching and leaching, and method of storage. Except for pasture, harvested forages are the cheapest source of nutrients.

a. Characteristics of legume hay are:

1) Highest yield per acre.
2) Highest in protein.
3) Highest calcium content of all farm grown feed.
4) Lower in phosphorous content than cereal grains but higher than grasses.
5) High in Vitamins A and D.
6) Legumes on the average have a higher TDN and net energy than grass hay. For average figures, see NRC or Morrison's Tables of Feed Composition. For specific examples, contact County Extension Agent for local analysis data.

b. Characteristics of grass hay are:

1) Yield will vary greatly but is lower than legumes in the same area.
2) Protein content of grasses is 50% or lower than legumes.
3) Calcium content is about 1/3 as great as that in legumes.

4) Phosphorous content is slightly lower in grass compared to legumes.
5) Grass hay is slightly lower in carotene, Vit. A, and Vit. D.
6) Lower in TDN (45.7%) and higher in fiber (31%) than legumes.
7) Palatability of grass hay will depend on kind of grass and harvesting methods.

c. Characteristics of silages are:
1) Highly palatable, slightly laxative.
2) Nutrient values of average silages are:
a) Grass - TDN = 15.6%; Fiber = 9.7%; Protein =3.2%
b) Legume - TDN=20%; Fiber=9.8%; Protein=4.1%
c) Corn - usually exceeds other home grown crops TDN production per acre.
d) Immature corn - TDN = 12.9%; Fiber = 5.8%; Protein = 0.9%
e) Carotene is generally higher than sun cured hay of the same crop.
f) Vitamin D is relatively lower in most circumstances.
3) Silage is generally worth more per 100 lbs of dry matter than hay.

d. Characteristics of other roughages such as straw.
1) High in fiber, very low in protein and energy.
2) Low in calcium and phosphorous.
3) Used as bulk in feeding fattening rations.

e. Silage - an acre of land will produce a higher yield of soilage crop than when used for pasture.

3. Factors which affect amount of forage consumed.

a. The species and type of produce desired will affect consumption. Examples are:
1) Beef cattle
a) Fattening - small amount of good quality roughages.
b) Wintering - large amounts of roughages depending on size of cow and weather conditions.
2) Dairy cows - large amounts of good quality roughages can be fed. The total ration should contain at least 40 to 45% roughage on a dry matter basis.
3) Sheep - good quality roughages alone will winter sheep up until 6 weeks before lambing.
4) Hogs - can use little roughage. What is used must be of good quality, preferably legumes.
5) Horses - cheap roughage may be used to winter horses. However, moldy or dusty hay should not be fed. Silage should not be fed to working horses.

b. The palatability of the roughages will affect the amount of roughage consumed by the animal. The

palatability will be determined by stage of maturity, methods of harvesting and handling the feed and the type of forage fed.

c. Frequency of feeding - animals fed less often will tend to consume more roughages per feeding but less total feed.

d. Method of feeding - animals on a self-feeding arrangement will eat more than their basic requirements for minimum maintenance.

e. Amount and kind of grain fed - the more concentrate fed the less roughage will be consumed.

f. Deficient or toxic rations may reduce intake due to poorer digestibility.

g. Environment - hot humid conditions reduce forage intake whereas cool or cold weather increases consumption.

h. Variety of forage fed-feeding a combination of forages may increase total dry matter intake, particularly if the forages are of poor quality.

i. Type of forage - hay vrs. green chop vrs. silage, etc. The type of forage fed should be determined on the basis of economics with considerations given to nutritional limitations. Satisfactory results may be obtained from all-silage, all-hay or combinations for cattle.

j. Physical form of feed - more intake if dense feed is fed. (pellets or cubes).

k. Abnormal fermentation in silages - poor quality silage may occur if silage is put up too dry or too wet. This will cause a decreased appetite for silage.

4. Standards for feeding roughages - generally, feed ruminants all the good quality roughages which they will eat. Given below are some approximate amounts of roughage which different species will eat.

a. Beef cattle
   1) 10#/cwt/day of green growing pasture
   2) 1.5# to 2.0#/cwt/day of hay
   3) 3# silage = 1# hay
   4) Straw can be used for roughage to some extent
   5) Total hay required
      20 - 30 lbs/day for 5 months wintering or 1.5 to 2.25 ton plus pasture or range.

b. Dairy cows
   1) 100 to 150# pasture/day
   2) 1.5 to 2.5# hay/cwt/day
   3) 3# silage = 1# hay
   4) Straw for bedding use only
   5) Total hay required - 20 to 30 lbs/day or 3.5 to 5.5 ton annually if fed year-round.
   6) A cow will consume up to 3.0 lbs. of dry matter per 100 lbs. body weight if the roughage is of good quality. Conversely, only 1.5lbs per 100 lbs. may be consumed if the roughage is very mature or of poor quality.

c. Sheep
   1) 1# range grass per 25# body weight
   2) 2# to 3# hay/cwt/day
   3) 3# silage = 1# hay
   4) Straw is of no value to sheep
   5) 5 to 6 sheep = 1 cow

d. Swine - used successfully as a weight regulatory device with brood sows, or to regulate marketing dates of other hogs.

e. Hay equivalent factors of other feeds.
   1) Definition - pounds of forage required to provide the same amount of dry matter present in 1 lb. of hay at a comparable moisture level. Therefore, the value will vary with moisture content. See table 1 (hay equivalent factors)

5. Economy of roughage - roughage is usually the cheapest source of TDN, Protein, and Energy.

E. Problems which may be encountered in forage feeding:

1. Results of changing forage rations.
   a. Requires time for rumen microflora adoption. Commonly causes stresses to animal which may cause a temporary reduction in production and adversely affect health.
   b. Plan forage program to avoid abrupt changes, particularly when many cows are expected to freshen. About 2-4 weeks are required for rumen adjustment when changes in types of forage are made.

2. Failure to full-feed forage when it is economically justified.
   a. Should feed to the point of moderate refusal by larger cows.
   b. Must feed more concentrates to larger cows if their forage intake is held to the average for the herd or that of milking heifers.
   c. Failure to limit forage intake when justified - sometimes it is more economical to feed a limited forage, high concentrate ration. Examples: fattening steers, high-producing dairy cows.
   d. Poor appetite for forage - may be related to:
      1) Ration imbalance or deficiency
      2) Poor quality roughage
   e. Some disorders are primarily forage related. Examples:
      1) Milk fever - High Ca, low P content in roughages
      2) Grass Tetany
      3) Nitrate Poisoning
      4) Prussic-acid poisoning
      5) Milk-fat depressions - particularly with pelleted rations
      6) Weak or silent heats - insufficient phosphorous
   f. Forage may fail to supply adequate nutrients for animal's production needs.

Table 1

HAY-EQUIVALENT FACTORS FOR COMMONLY USED FORAGES

Moisture %	Usual Examples	Hay-Equivalent Factor
85	Actively-growing forage	6.0
80	Direct-cut hay-crop in horizontal silos	4.5
	Green forage in mid-summer	
85	Direct-cut hay-crop in upright silos	3.6
	Wet or immature corn silage; other annuals	
70	Wilted hay-crop, normal corn silage	3.0
65	Wilted hay-crop, dry corn silage	2.6
60	Haylage	2.3
55	Haylage	2.0
50	Haylage	1.8
45	Haylage	1.6
40	Haylage	1.5
35	Haylage	1.4
30	Haylage	1.3

5575

F. Utilizing grain for feeding livestock.

1. Economic importance of concentrates usually grain and protein supplements.
   a. Concentrates will be used to bring nutrients in roughage ration to desired level when livestock is being fed for maximum production.
      1) Concentrates may be either low or high in protein.
      2) All common feed grains are concentrates.
      3) Corn is used as a standard when determining the value of grains.
   b. Amount of total ration supplied by concentrates for various species.
      1) Beef--when fattening 90% of total ration can be grains.
         In the breeding herd grain can be substituted for roughage when economical. Calves should be wintered on grain equal to 1% of body weight.
      2) Sheep--grains can be used as a source of energy when needed on range. Fattening lambs should be fed grain at rate of 1½ lb. per day or more.
      3) Swine--fattening rations will be about 95% concentrate and fed up to approximately 4 lbs/cwt of live pig. Brood sows should be limited to the energy needed.
      4) Dairy-grain should be limited to 4-6 lbs per day until 6 months of age, 2 lbs per day from then until 3 months before calving if good roughage is given. Grain should be increased from ½ lbs/cwt to 1 ½ lbs/cwt - from 3 weeks until calving - producing cows will eat up to 2½ lbs/cwt of live body weight but should be fed according to milk production.
      5) Poultry--total ration should not be over 5% fiber. Concentrates will make up about 97% of the ration.
      6) Horses--grain can be fed at the rate of ½ lb/cwt of live body weight. Horses working hard can be fed grain to double this amount.

2. Grains utilized for feeding livestock - The particular grain use will depend upon the home-grown grain available, the cost for buying needed grain and the limitations on feeding that grain. Grains commonly used and their characteristics are:
   a. Corn
      1) Excellent where available, (corn and cob meal are excellent feeds for dairy and beef animals.)
      2) Should be ground or cracked for swine & poultry.

b. Rye
   1) Not generally used in wheat growing areas.
   2) Can be used up to 45% of concentrate for dairy, beef and sheep.
   3) Rye should not be fed to young chicks.
   4) May not be palatable for swine.

c. Barley
   1) Averages 5.4% fiber, TDN higher than oats and less than corn.
   2) Barley can be used as the sole source of grain for dairy cattle.
   3) Beef cattle gain as rapidly on barley alone as on corn alone.
   4) Sheep gain as well on barley as corn but require more feed.
   5) Barley can be fed as the only grain to sheep.
   6) Swine do nearly as well on barley as on corn but require more feed.
   7) Barley is less palatable for poultry and is less valuable than corn. It should be limited to 30% of chick starter and 15% of boiler rations.

d. Wheat
   1) Beef cattle can utilize wheat at the rate of up to 60% of the concentrate ration. Inexperienced feeders should use no more than 30% wheat in the ration.
   2) Wheat is worth more than shelled corn in the ration but may cause bloat if fed alone.
   3) Wheat is equal to ground corn for dairy cows. Soft Pacific Wheat can furnish up to 100% of the grain in the ration.
   4) Wheat is worth more than barley for fattening lambs and need not be ground.
   5) Wheat should be mixed with a bulky feed for horses.
   6) Wheat is preferred over barley for poultry.
   7) Wheat is worth more than corn for swine and need not be ground when self fed.

3. Advantages and limitations of grains for feeding:
   a. High in starch - low or relatively low in fiber, high in TDN and net energy.
   b. Palatability - nearly all grains are palatable to all livestock with the exception of rye.
   c. Minerals - slightly higher than hay in P but low in Ca.
   d. Vitamins - generally low in Vitamins. Corn is the only grain that has an appreciable pro-Vitamin A content. All grains contain an adequate supply of Vitamin E.
   e. Protein and quality of protein is such that some supplementation is generally needed.

f. Because of their limitations, grain alone will not give an adequate supply of nutrients to meet livestock needs. Grains usually need to be supplemented to supply adequate levels of:
   1) Protein (amount and quality)
   2) Minerals
   3) Vitamins
   4) Bulk

4. Criteria used in determining the levels of grain feeding.
   a. Dairy-acording to milk production
   b. Swine
      1) Fattening swine should be full fed on grain concentrates.
      2) Breeding herd should be supplied with enough net energy to supply body and fetal development needs.
   c. Beef
      1) Fattening beef can be full fed on grains.
      2) Breeding herd should have grain or supplements to supply energy and protein if fed low quality hay.
   d. Sheep
      1) Fattening - grain intake should be limited to what they can clean up in 15 minutes twice each day or they can be self-fed a grain ration mixture of 1/3 oats, barley and beet pulp.
      2) Breeding herd - should be fed only to meet the energy needs and nutrient needs not furnished by the forage.
   e. Horses should be fed according to the work they are doing.

C. Supplying protein needs to provide optimum livestock production.

1. Proteins are used by the body in the following ways:
   a. As structural components (80% of the body weight is protein on a dry and fat free basis).
   b. As enzymes
   c. As Hormones
   d. As oxygen carriers in blood
   e. and are associated with genes

2. Effect of protein on feed costs and production.
   a. Expense - there must be a correlation between amounts of protein with relation to production and cost because protein is usually the highest cost feed stuff.
   b. A lack of protein will cause:
      1) Lower production
      2) Lower efficiency
      3) Lack of growth
      4) Kwashiorkor in humans
      5) Poor reproduction

c. Excess protein will cause:
   1) Excess costs
   2) a) animal will not limit amounts of protein intake.
      b) excess protein will be converted and used as an energy source.

3. Importance of protein quality.
   a. Proteins are complex compounds made of 25 or more amino acids.
   b. Ruminants will supply the quality of protein if the quantity is present. This is possible because microbial action will manufacture specific amino acids for use by the animal. However, the proper quantity of protein is very important.
   c. Monogastric (simple stomach) animals cannot make ten of the amino acids and therefore the following are considered the * essential amino acids:
      1) Histidine
      2) Arginine
      3) Valine
      4) Leucine
      5) Isoleucine
      6) Trypotophane
      7) Threonime
      8) Lysine
      9) Methionine
      10) Phenylalanine

   * Key to memorize PHILL MT VAT

   d. Chickens also need glycine in addition to the 10 essentials.
   e. Arginine - not considered essential for maintenance in rats but required for growth.
   f. In swine the following amino acids are not required for maintenance but are required for growth.
      1) Arginine
      2) Histidine
      3) Leucine
   g. Humans - both arginine and histidine are not thought to be required for adult maintenance but probably are necessary for normal growth of children.
   h. High quality - low quality protein.
      1) The quality of the protein would be in reference to the types of amino acid present in relation to the types needed.
      2) In feeding poultry or swine the quality is as important as quantity.
      3) Different feeds (plant and animal sources) may supplement the limiting amino acids of each other and thereby increase the protein quality.

4. Supplying quality protein - a source must have at least 20% protein to be considered a protein supplement.
   a. Home grown feeds often need to be supplemented with a protein supplement in order to provide livestock with adequate protein for optimum production.
   b. From animal sources:
      1) Meat by-products such as meat scraps and tankage are good sources of protein if an economical source is available.
      2) Milk and milk products provide a good source of protein but are usually too expensive for common use by most species.
   c. Plant sources
      1) By products which contain between 20-30% protein.
         a) Gluten feed
         b) Brewers' grain
         c) Malt sprouts
         d) Distillers' grain
      2) Compounds containing 30% and up protein.
         a) Linseed Oil Meal
         b) Cotton Seed Meal
         c) Soybean Oil Meal
         d) Mustard Oil Meal
            Recent research indicates that mustard oil meal is usable in limited amounts up to 20% of protein supplement for beef cattle and sheep.
            Five percent of the feed is probably the upper limits for swine.
   d. Avian as a source of protein.
      1) Poultry feathers have been treated and used to some degree of success as a protein supplement.
   e. Waste products as a source of protein - research is presently being conducted with many waste products to determine the protein feeding value. For example, excretory wastes are currently being investigated.
   f. Marine - Fish Meal
      1) Fish meal may have a high percentage of protein (up to 80%) but may have some limiting factors due to a lack of cystine and methionine. Investigation continues to find the optimum use in many different feeds.
      2) The amount of salt in fish meal may be a limiting factor for use in feed.
   g. Non-protein nitrogen - may be used with ruminants up to certain levels. Common sources are:
      1) Biuret
      2) Diammonium phosphate
      3) Urea
         a) This is an N.P.N. source that is being used most at the present time.

b) Urea furnishes no energy and is not a protein, but is a manufactured nitrogen product that will substitute for protein if properly used and if economically justified.

c) The lack of minerals and energy in N.P.N. requires that the other part of the ration must be higher in these nutrients.

d) Economics - if 7 lbs. of grain plus 1 lb. urea is cheaper than 7 lbs. of soybean oil meal then urea may be used up to the safety limits.

e) Factors to consider in using urea.
   1) Ruminants should be gradually converted to feeds containing urea (2 to 4 weeks).
   2) Mix well - urea must be mixed well with the feed used.
   3) Do not mix with raw soybeans for the soybeans contain urease which will act on the urea to release ammonia.
   4) Do not feed to calves prior to 2-3 months of age.
   5) Do not feed over recommended amount. The recommendation for each class of livestock will vary.

5. Factors determining amounts of protein supplement needed.
   a. Kinds and amounts of feeds fed.
      1. Feeds vary in the amounts of digestible protein.
      2. There are a number of charts which provides the average composition of protein in various feeds.
      3. However, the maturity, condition, and methods of harvesting roughage have a part in the amount of protein supplement needed so an analysis of the feed fed should be made to determine the exact needs.
   b. Species of animal and protein requirements.
      1. Ruminants (cattle and sheep) have little trouble with the quality as long as they have the proper amounts.
      2. Swine and poultry need the proper type as well as the proper amounts.
      3. Amount and type of produce (work, eggs, meat, milk, etc.) will determine quantity and quality needed.
   c. Age - it is very important that young animals have ample amounts of protein of the proper kind for growth.

H. Providing necessary minerals for livestock.

1. Functions of minerals are:
   a. Skeletal and soft tissue formation.

b. As a part of enzyme reactions.
c. As an integral part of some organic compounds, examples are:
Fe - hemoglobin
Co - Vit B_{12}

2. Deficiencies symptoms are:
a. Phosphorous
1) Lack of appetite.
2) Unthrifty appearance.
3) Weak or dead off-spring.
4) Depraved appetite - "pica".
5) Poor breeding efficiency
b. Calcium
1) Low milk production.
2) Bones break easily.
3) Poor bone growth - ricketts.
c. Iodine
1) Weak young.
2) Goiter - usally observed in the young for domestic livestock.
d. Iron
1) Most critical for young swine.
2) Anemia in baby pigs.
e. Cobalt as such is required for ruminants but not for simple stomach animals. Simple stomached animals receive cobalt in vitamin B_{12}. Cobalt supplementation would vary with the region. Montana is not known to be cobalt deficient.
f. Zinc
1) Parakeratosis - in swine.
2) Needs to be supplemented in swine rations.

3. Mineral content of feed.
a. Cereal grains tend to be high in P and low in Ca
b. Calcium is most apt to be deficient in swine.
c. Nonlegume roughages have less calcium than legume.

4. Minerals likely to be deficient under Montana conditions.
a. Salt is the one mineral supplement needed for all species of animals.
b. Calcium is most apt to be deficient in swine and poultry due to low roughage intake.
c. Phosphorour is most apt to be deficient in ruminants because of high amount of roughage and low amount of concentrates fed.
d. Iodine - the Northwest United States including Montana is in an iodine deficient area and therefore the ration needs to be supplemented. Iodine is usually fed free choice as a stabilized, iodized salt.
e. Except for iodine, trace minerals for ruminants in Montana have not shown to be essential.

f. Trace minerals are generally added to all swine and poultry feeds. Zinc in the most critical trace element for the swine ration. Iron is most apt to be deficient in young pigs.

5. Means of supplying essential minerals.
   a. Salt
      1) Feed free choice.
      2) Mix with feed at 1% of ration for dairy cattle.
      3) Mix .5% with grain for swine.
      4) Form in which salt is purchased:
         a) block
         b) loose
         c) rock or lump
      5) Salt is presently being used in beef to limit the amount of feed (such as protein supplement) intake.
   b. Calcium and Phosphorus.
      1) Source
         a) monosodium phosphate
         b) diammonium phosphate
         c) dicalcium phosphate
         d) steamed bone meal
         e) polysodium phosphate
      2) Method of feeding would depend on the form.
         a) free choice
         b) mixed in feed
      3) There must also be a concern for having the calcium and phosphorous in proper ration.
   c. Trace minerals - Iodine is supplemented by the use of iodized salt to ruminants. A trace mineral premix should be used in swine and poultry rations. the premix should contain sufficient amounts of minerals to furnish the levels recommended by the National Research Council.

I. Providing adequate vitamins.

1. Characteristics of vitamins.
   a. Definition - an organic substance which is an essential dietary constituent needed in minute amounts for one or more species.
   b. Some vitamins are metabolic essentials but not dietary essentials because they can be synthesized from food or other metabolic compounds. Example: vitamin C is a dietary essential for man, guinea pigs, and monkeys, but not for domesticated livestock.
   c. The vitamins are often classed as to their solubility
      1) Fat soluble vitamins include A, D, E, and K.
      2) Water soluble vitamins include C and members [illegible]e B complex.

d. The members of the B-complex were first designated by letters but the use of names have become more common for most members. B complex members include:
   1) Thiamine
   2) Riboflavin
   3) Niacin
   4) B_6
   5) Pantothenic acid
   6) Biotin
   7) Choline
   8) Folic acid
   9) B_{12}

e. Vitamins considered likely to be deficient will be discussed in further relation to livestock.

f. Vitamin requirements are stated in forms of units - see table 2.

2. Function, deficiency symptoms and natural sources of vitamins which are frequently added to farm animal rations - see table 3.

3. Supplementing livestock feeds with vitamins.
   a. Dietary needs for vitamins differ widely among species, therefore the amounts given should be based on recent NRC recommendations.
   b. The vitamin needs for swine and poultry may be met by adding to the grain mixture a vitamin premix which meets the minimum NRC recommendations.
   c. Under normal circumstances Vitamin K is a dietary need for poultry only.
   d. The B-complex vitamins are not a dietary need for ruminant animals because of bacterial synthesis in the rumen.
   e. Ruminants on pasture or receiving high quality sun-cured hay will receive adequate amounts of Vitamins A, D, and E. Animals receiving low roughage rations or bleached roughage should have some vitamin A supplementation.

TABLE 2

VITAMIN UNITS

The practice of expressing the strength of a vitamin preparation in "units" is a relic of the days before isolation of the pure chemical substance. Units represent the first approximation attempts at dealing quantitatively with the new factor in question, and were a convenient device to express the activity of a preparation containing an unknown amount of an uncharacterized material. The availability of crystalline vitamins made it possible and desirable to work in terms of milligrams or micrograms of the pure substance.

The accuracy of any assay is enhanced when a standard product is available for comparison. Standard vitamin preparations were first made available by the Permanent Commission on Biological Standardization of the Health Organization of the League of Nations and distributed through National Control Centers to qualified investigators. Its functions have been assumed by the Expert Committee on Biological Standardization of the World Health Organization. These standards are widely used for research and to prepare working standards for use by manufacturers and enforcement agencies. International standards have been established for vitamins A, B_1, C, D, and E. An "International Unit" is, by definition, based on the activity of an International Standard preparation. The United States Pharmacopoeial Convention has been designated as the Control Center for the United States. Its Committee on Reference Standards has extended the work of the original Commission until USP standards for ascorbic acid, calcium pantothenate, choline chloride, nicotinamide, nicotinic acid, pyridoxine hydrochloride, riboflavin, thiamine hydrochloride, eight "essential" amino acids, vitamin A and vitamin D (form for both rat anc chick assay) are now available. (Address USP Reference Standards, 46 Park Ave., New York 16, N.Y.). When an International Standard exists, the USP standard is compared and brought as closely as possible into agreement. Therefore, a "USP unit" is equal to an "International Unit."

The existence of adequate standards has proved a boon, both to research workers and to Federal and state control officials.

Vitamin A

1 I.U.= USP unit=the vitamin A activity of .344 micrograms of crystalline vitamin A acetate, corresponding to .30 micrograms of vitamin A alcohol.

Provitamin A: beta-carotene

1 I.U.=0.6 micrograms of beta-carotene. The International Standard is a solution in vegetable oil, containing 200 I.U. per gram.

Vitamin D

1 I.U.=1USP unit= vitamin D activity of 0.025 micrograms of crystalline vitamin D_3. Products assayed against this new standard (official May 1, 1951) will have only 93.4 per cent of the unitage shown when assayed against the last USP Cod Liver Oil Reference Standard.

An even greater difference is shown when the new USP Standard is used for assay of chicken feeds. Products assayed against the new standard show about 75 per cent of the unitage shown when assayed against the last USP Cod Liver Oil Reference Standard. In order to differentiate between the present A.O.A.C. Chick Unit, the new Unit which is 33 per cent larger, the term "International Chick Unit" has been adopted.

Other vitamin units

The activity of other vitamins is expressed as the weight in milligrams or micrograms of the various chemically pure materials.

One still occasionally encounters values for vitamins other than A and D listed in "units". For reference use, we list these below.

Thiamine: 1 I.U.=the thiamine activity of 3.0 micrograms of crystalline thiamine hydrochloride.

Ascorbic acid: 1 I.U.=the vitamin C activity of .05 mg. of L-ascorbic acid.

Vitamin E: 1 I.U.=the vitamin E activity of 1 milligram of synthetic, racemic alpha-tocopherol acetate.

Table 3

DATA ON VITAMINS

Name	Function; units of potency, etc.	Deficiency Symptoms	Good Natural Sources	Other Sources (synthetic concentrates)
Choline	Essential for building and maintaining cell structure. Essential in fat metabolism	Slow growth Hemorrhagic kidneys	All natural fats contain some choline	Methionine and Cystine to furnish labile Methyl groups
Niacin	Components of two coenzymes which function in biological oxidation reduction systems	Pellagra in man. In swine slow growth, diarrhea, dermatitis, Similar symptoms in chicks	Animal and fish by-products. Distillers grain and yeast.	
Vitamin E	Reproduction in rats. Hatchability in poultry. Normal muscle development in many animals	"Stiff-lamb" disease. Muscle disorders in many types of animals. White muscle disease in calves. Heart muscle injury	Whole cereal grain particularly in the germ. Green forage and other leafy material	Synthetic D, L-Alpha-toxopherol acetate is the international standard
Vitamin K	Blood coagulation	Subcutaneous and intermuscular hemorrhages in poultry. Deficiencies in other species only under special conditions	Green leafy material fresh or dry. Any dietary need may be unimportant in species other than birds because of bacterial synthesis in the G.I. tract.	Menadione

5586

Table 3, Continued - DATA ON VITAMINS

	Function; units of potency, etc.	Deficiency Symptoms	Good Natural Sources	Other Sources (synthetic concentrates)
Vitamin A (animal form) Carotene (plant form or Pro-Vitamin A)	Stimulates the formation and development of body cells--hence a growth vitamin. Also involved in dim-light vision. 0.6 μg carotene = 1 IU of vitamin A	Retarded growth of young. Interference with reproduction. Impaired night vision.	Leafy forage, fresh or preserved against oxidative loss. Milk or fish fat (variable). Yellow corn	Pure crystalline vitamin A acetate 3,000,000 IU/g. Mixed carotene, 1,000,000 IU/g
Vitamin D (D_2 is plant form; D_3 is animal form)	Facilitates absorption of calcium, hence is related to normal bone formation. Irradiation by direct sun (ultraviolet rays) effectively supplies animals with needed vit. D. Poultry do not utilize D_2 effectively.	Rickets in young; osteomalacia in adults. Swollen and sore joints. Poor reproduction	Sun-cured leafy hay for animals (but not poultry).	Fortified fish oils, irradiated sterols for both poultry and animals. Crystalline D_2 or D_3 40,000,000 IU/g
Riboflavin	Part of an enzyme necessary for the oxidation process in all living cells. It is synthesized by microorganisms in herbivora.	Slow growth, nerve degeneration, diarrhea, (pigs, calves) Curled toe paralysis, low egg production (poultry)	Liquid, condensed or dry milks Dried leafy forages. Distillery solubles. Dried brewers' yeast.	Pure synthetic riboflavin, 400,000 BS units/g 1 g has potency of 100 lb. skim milk powder.

Table 3 - continued - DATA ON VITAMINS

Name	Function; units of potency, etc.	Deficiency Symptoms	Good Natural Sources	Other Sources (synthetic concentrates)
Pantothenic Acid	A part of Coenzyme A, necessary for the utilization of all energy yielding nutrients. Particularly important in Canada, since typical Canadian hog rations are often too low in this vitamin	None in herbivora. Stilted gait in pigs, especially with hind legs (often called goose-steping and confused by some with rheumatism or rickets). Dermatitis around bill and eyes in poultry.	Brewers' yeast. Dry milk or whey. Cane molasses. Alfalfa.	Synthetic calcium pantothenate (92% pantothenic acid).
Vitamin B_{12}	A cobalt-containing substance active in treating pernicious anemia. Probably active part of "the animal protein factor."	Poor growth, poor feathering, poor hatchability. Its use usually increases gains of young by 10-20%.	Feeds of animal or marine origin. Liver meal is especially potent.	Fermentation products and by-products from making antibiotics.

J. Providing water

1. All species of animals need water in varying degrees

2. Functions of water are:
   a. Body thermoregulatory
   b. Dissolving nutrients
   c. Transportation of nutrients and body waste
   d. Digestion
   e. Structure

3. Sources of water:
   a. Drinking water
   b. Metabolic water
   c. Feed-natural water content
   d. Water must be of good quality, clean, and free from excess minerals

4. Amounts needed - all animals should have free choice at all times
   a. Rule of thumb would be 2 3/4 lb. water/lb. of dry matter plus water for production.
   b. Amounts needed vary with amounts lost
      1) Temperature
      2) Production level (milk, eggs, etc.)
      3) Type of feed fed - relates to the percentage of moisture in the feed.
      4) Species - amounts given are approximately daily consumption

Poultry, 100 hens	4 - 6 gallon/day
Ewes	1 - 1 1/2 gallon/day
Sow with litter	5 gallon/day
Beef Cattle	10 gallon/day
Dairy Cattle	
Med Prod (30 lbs milk/day	13.5 gal/day
High Prod (80 lbs milk/day	24 gal/day

K. Utilizing feed additives in feeding livestock

1. Feed additives are materials that are not nutrients (dietary essentials) but are added to the feed for the purpose of increasing feed efficiency, growth rate, health of the animal or level of production. The additives are fed at very low levels.

2. Feed additives include antibiotics, hormonal compounds, coloring materials and flavors.
   Examples;
   Low levels of antibiotics (Aureomycin, streptomycin, etc.) for swine, poultry, calves, lambs.

Stilbestrol fed orally implanted in fattening steers.
Thyroprotein (iodinated casein) fed to lactating dairy cattle - uncertain responses.
Marigold feed is used in poultry rations when a high yellow egg yolk is desired.

3. Any feed additive must be used according to the manufacturer's directions. Higher levels may result in undesirable residues in the marketed product or undesirable side effects in the animal.

IV. BALANCING THE RATION

A. Determining the needs

1. Nutrients are needed for:
   a. Maintenance - those nutrients in quantity which are needed to maintain the animal's physical existance at an even, healthy level.
   b. Production - additional energy and other nutrient requirements beyond the maintenance of the animal's body are required for production of:

      meat eggs
      milk work
      wool
      reproduction of species

      The quantity as well as the type of production must first be considered before one can determine an animal's nutritional needs.

2. Feeding standards established for determining nutrient needs. Different tables are available which state the amounts of nutrients required by farm animals, by species, at various ages and production levels to secure optimum results. Tables indicate requirements for protein, energy (TDN or net energy), vitamins, and minerals. References most commonly used are:
   a. Morrison's Feeding Standards
   b. NRC (National Research Council)

3. Aspects other than nutrient content need to be considered in balancing ration.
   a. The available home grown feeds will affect the ration because they generally are more economical to use. However, they may need to be supplemented with proteins, vitamins, and minerals.
   b. The feeds which need to be bought to balance the ration will be determined by the cost per pound of nutrients of the available feeds.
   c. The limitations of feeds such as palatability and feed intake limitations of animals should be considered.
   d. The comparative feed value of different feeds for different species should be evaluated.

B. Computing the ration

1. Determine the nutrient needs for the particular situation according to feeding standard recommendations (From Morrison or NRC Tables).

2. Determine the nutrient content in feeds to be fed (From Morrison or NRC Tables).

3. Calculate the amount of feed required to meet nutrient needs for the particular situation.

4. See the examples for calculating net energy that follow.

NET ENERGY PROBLEM

Net Energy Required for Maintenance of 500 lb. steer.

NE_m = 4.55 megcal/day (See Table 4)

Net Energey Required for 1.0 lbs. gain/day on a 500 lb. steer.

NE_g = 1.48 megcal/day (See Table 4)

Feeds Used to Balance Ration:

Alfalfa hay 34% fiber

Barley grain

(Amounts furnished by feed. See Table 6)

Feed	(NE_m) megcal/100 lbs.	(NE_g)
Alfalfa hay, 34% fiber	42	8
Barley grain	87	58

	NE_m	NE_g
Animal Need	4.55 megcal/day	1.48 megcal/day
Alfalfa Hay, 34% fiber	42 megcal/100#s	8 megcal/100#s
Barley grain	87 megcal/100#s	58 megcal/100#s
8#s Alfalfa Hay	3.36 megcal.	.64 megcal.
2# Barley grain	1.74 megcal.	1.16 megcal.
Total megcal supplied	5.10 megcal.	1.80 megcal.

DEMONSTRATING NUTRITIONAL DEFICIENCIES

Richard F. Welton*

In order to make instruction in livestock nutrition more meaningful, a simple experiment was devised for students to demonstrate nutritional deficiencies. All of the equipment, material, and feed are available from local hatcheries, feed dealers, and in the school or home.

This study was run for a period of four weeks, and involved 200 male single combed white leghorn chicks. The chicks were divided into seven groups of 30 birds each; except group seven, which consisted of 20 birds. Each of the seven groups of birds were further divided into pens of 10 each. Four chick diet components were varied in the diets which were fed. The four components were: 1. Ground corn, 2. Soybean oil meal (50% protein), 3. Vitamin premix, and 4. Mineral pre-mix.

The nutritional requirements for the chicks from birth to eight weeks of age were used to determine the nutritional level of the control diet.

The basis of the vitamin pre-mix was a Ray Ewing Grow-Lay Pre-Mix 2. However, to raise the nutritional level of the ration to minimum requirements as would be needed when feeding only corn, supplemental vitamins were added as shown in Table 1. Finely ground corn was added to bring the total weight of the vitamin pre-mix up to two pounds. These ingredients were mixed together in a feed mixer for 10 minutes.

The mineral pre-mix contained: 1. Eight pounds of Purina Mineral SP-37753, 2. One pound of iodized salt.

The mineral mix was ground to a texture of table salt, and mixed with the iodized salt for 10 minutes.

Seven combinations of the four feed components were selected as the following treatments:

Treatment 1. Corn, soybean meal, vitamin pre-mix and mineral pre-mix (control diet).

Treatment 2. Corn, soybean meal and mineral pre-mix. (vitamin deficient diet).

* Reprinted with permission of the author.

Treatment 3. Corn, soybean meal and vitamin pre-mix. (mineral deficient diet).

Treatment 4. Corn, and soybean meal. (vitamin and mineral deficient diet).

Treatment 5. Corn, vitamin pre-mix and mineral pre-mix. (protein deficient diet).

Treatment 6. Corn and mineral pre-mix. (vitamin and protein deficient diet).

Treatment 7. Corn only. (protein, vitamin and mineral deficient diet)

The seven diets are described in Table 1.

Prior to placing the chicks in the battery, the equipment was cleaned thoroughly and the brooder temperature set at approximately 100° F. The temperature was reduced 5-7° each week of the study until room temperature of 70° F was reached.

Table 1. Supplemental Vitamins

Vitamin	Supplied by pre-mix	Supplied in addition to pre-mix	Total
Vitamin A	2000 IU	none	2000 IU
Vitamin D_3	750 IU	none	750 IU
Vitamin B_{12}	1 mg	4 mg	5 mg
Riboflavin	.75 mg	1 mg	1.75 mg
Niacin	25 mg	10 mg	35 mg
Pantothenic Acid	.15 mg	4 mg	.55 mg
Choline	10 mg	400 mg	410 mg

Table 2. Composition of Diets Used in Experiment

Kind and Amount of Feed Used (Pounds)

Corn vs complete diet	Treatment	Corn	Soybean meal	Mineral pre-mix	Vitamin premix	Total
Complete vs vitamin deficient (T2)	1	25.8	12.0	1.8	.4	40
Complete vs mineral deficient (T3)	2	26.2	12.0	1.8	0	40
Complete vs vitamin and mineral deficient (T4)	3	27.6	12.0	0	.4	40
	4	28.0	12.0	0	0	40
	5	37.8	0	1.8	.4	40
	6	38.2	0	1.8	0	40
Corn vs protein deficient (T5)	7	40.0	0	0	0	40
Corn only (on right) vs protein and vitamin deficient (T7 vs T6)	Total	187.5	48	7.2	1.2	280

Results and Discussion: The control treatment provided the best growth (Table 3). During the fourth week, the gain by birds in treatment one was twice that of birds in treatment number two, but treatment two had the highest gain. Therefore, the least of the difficulties was caused by a simple vitamin deficiency in this case. The deficiencies of protein or minerals resulted in a very severe growth restriction. This indicated that minerals and protein were the most limiting factors in this study. It was interesting to note that the corn diet (treatment 7) actually showed a decrease in gain during the second week.

Feed efficiency (table 4) was comparable in treatments one and two. The difference was only 20%. Feed efficiency numbers for treatment four and seven were quite large and meaningless to chart. Treatment six (corn and minerals) was little affected by the absence of vitamins (compared to treatment five and six). Feed efficiency appeared to be primarily a reflection of differences in rate of gain.

Feed consumption was the greatest in the control diet (treatment one) The increase was gradual during the first three weeks of the study when compared to the six other treatments. However, during the fourth week, the feed consumption increased by 225 grams per bird when compared to the next highest intake diet (treatment two), which consumed an average of 55 grams per bird during the week. Again, it was obvious that feed consumption as well as feed efficiency was a function of growth rate. Perhaps the reason for the reduced feed consumption in treatment two during the fourth week could be explained by exhaustion of vitamin supply supplied by the yolk at birth. It was interesting that feed consumption fell off during the second week and never recovered in treatments four, five, six, and seven.

It is important to note the mortality in both the corn treatment and the corn with protein treatment was approximately 90% during the study. Losses in treatment seven were not noticeable until after the second week. The 10% mortality in the control pen occurred during the first week and was unrelated to treatment effect.

Table 3. Effect of Diet on Body Weight Gain

Dietary Deficiency	Ave. Start	Body Wt. (grams) 1st wk	2nd wk	3rd wk	4th wk	Overall avg. gain
1. none	34	72	130	212	309	275
2. vitamin	34	65	94	132	160	126
3. mineral	33	47	58	64	73	40
4. vitamin & mineral	33	45	45	45	46	13
5. protein	32	45	55	69	82	50
6. vitamin & protein	33	49	62	76	94	61
7. protein, vitamin & mineral	32	38	37	37	39	7

Table 4. Effect of Diet on Chick Efficiency

Dietary Deficiency	Feed/Gain 1st wk	2nd wk	3rd wk	4th wk
1. none	2.1	1.9	1.7	1.9
2. vitamin	2.2	2.4	2.4	2.4
3. mineral	3.9	3.8	5.4	4.9
4. Vitamin & mineral	4.6	8.5	9.1	9.6
5. protein	5.0	4.8	4.5	4.6
6. vitamin & protein	4.0	4.0	4.1	4.2
7. protein, vitamin & mineral	10.0	15.0	64.0	50.0

Conclusions:

1. The effect of a balanced ration had a remarkable effect upon the comulative gain of the birds in this study.
2. Unsupplemented ground corn had a very unfavorable effect on gain.
3. The omission of one or any combination of the three feed components, which were varied, markedly affected the cumulative gain of the various treatments.
4. The high protein and mineral ration showed a favorable response to gain. The addition of only protein to the corn diets did not improve rate of gain.
5. Feed efficiency was especially low when vitamins and minerals were omitted from the diet.
6. Birds in this study apparently were unable to utilize unsupplemented corn or corn with protein efficiently.
7. Minerals supplementation relieved death losses more than supplementation with vitamins or protein in this study.
8. This type of study is recommended as an excellent demonstration project for older students.

ABSTRACT - Prepared by the Office of Vocational Education of the South Carolina State Department of Education in cooperation with the Department of Industrial Education and the Vocational Education Media Center of Clemson University, this curriculum guide is for teacher use in a 2-year high school and area vocational center building construction program. The material is aimed toward the development of basic manipulative skills and knowledge required for entry into the occupation of the student's choice, along with the development of desirable work habits and attitudes. Specific objectives, program description, the duties of a carpenter, and an outline for a 2-year carpentry course are included in this guide. A considerable amount of supplementary instructional material and additional sources of information are appended. Transparencies to accompany this material are available as VT 012 633, also in this issue. (GEB)

PREFACE

Building Construction programs are offered in about 50 high schools and area vocational centers across the state of South Carolina. These programs have been quite successful in preparing young men to enter the carpentry trade as apprentices, and have proven valuable in helping ease the critical shortage of carpenters which exists in many sections of the state. In the past, some of these courses were called Carpentry and some were called Building Construction. Both groups are presently entitled Building Construction.

In order for you as an instructor of one of these programs to be assured that your course is being taught in the most efficient manner, there are several things you must do. These are summarized in seven steps as follows:

1. Analyze the trade and determine what skills and knowledges are required to hold a job in the trade.

2. Establish goals or objectives for students to achieve in the program.

3. Organize course content in such a manner that students have an opportunity to meet the objectives. (Include exercises, projects and other methods to do this).

4. Prepare daily lesson plans and secure the instructional materials needed for teaching the course.

5. Teach the course the most efficient way.

6. Evaluate results of the teaching. This evaluation should be a dual one—evaluation of individual students to determine their achievement in the course and evaluation of the total program to determine how well graduates perform after employment. The evaluation of both the students and the performance of graduates should identify areas of the instructional program which need strengthening.

7. Make needed improvements in the program. These improvements may be eliminating weaknesses identified in evaluating the program (Step 6), the addition of instruction on innovations occurring in the trade, or deletion of obsolete information.

This curriculum guide should aid the instructor in carrying out these seven steps which we feel are essential in offering an effective instructional program.

The curriculum guide committee, which includes carpentry instructors, supervisory personnel, teacher educators and experienced carpenters, has attempted to:

1. Analyze the carpentry trade.
2. Establish objectives for the course.
3. Organize course content.
4. Provide supplementary instructional materials.
5. Give sources of additional information.

This guide was not written to be the text needed to teach a course, but rather to serve as a basic framework upon which you can develop your own instructional program. Modifications of the outline of objectives and course content may be helpful in some localities, since building practices vary in different sections of the state. You should be able to use the curriculum guide as a basis to write your own course of study.

Those who have prepared this guide sincerely hope it will make the job of the teacher easier and improve the overall quality of the programs.

ACKNOWLEDGEMENTS

We wish to acknowledge and express our gratitude to the following people who served on the Building Construction Curriculum Planning Committee and who spent many hours in gathering material for use in this publication:

Mr. W. L. McDuffie, Former Teacher Educator, South Carolina State College, Orangeburg, South Carolina (Presently serving as Principal, Denmark Branch, South Carolina Area Trade Schools).

Mr. Gene McGrew, District 5 Supervisor, Trades and Industries, Box 1486, Florence, South Carolina.

Mr. Frank Galloway, Instructor, Oconee Vocational Education Center, Seneca, South Carolina.

Mr. James E. Wright, Instructor, Florence County Vocational Center, 1125 Cherokee Road, Florence, South Carolina.

Mr. Arnold Hansen, Instructor, Pageland High School, Pageland, South Carolina.

Mr. W. T. Whetsell, Instructor, Bonds-Wilson High School, North Charleston, South Carolina.

In addition to members of the committee, we wish to thank Dr. Alfred Newton, Trades and Industries Teacher Educator, Clemson University; Mr. F. A. Bosdell, Assistant Trades and Industries Teacher Educator, Clemson University; and Mr. C. J. Weeks, State Supervisor of Trades and Industries, for reviewing the manuscript and offering their suggestions for its improvement.

GENERAL OBJECTIVES

The Trades and Industries programs should help the student attain:

1. Basic manipulative skills and knowledge required for entry into the occupation of his choice.
2. An understanding of the responsibilities of a citizen of our democracy.
3. A positive, healthy attitude toward work.
4. Desirable work habits.
5. The ability to cooperate with fellow workers, employer, and customers.
6. The ability to accept and adapt to technological changes.
7. An appreciation of quality workmanship.
8. Self-confidence and initiative.
9. Communicative skills—the ability to listen, to understand, and to be understood.
10. Knowledge of the importance of performing jobs in an orderly, organized fashion.
11. A knowledge of the job opportunities to be found in the trade.
12. A knowledge of the best procedures to follow to secure a job.

DESCRIPTION OF PROGRAM

1. *Length*

Building Construction, as well as the other Trades and Industries programs offered in high schools and area vocational centers, is 1,080 hours in duration. Classes are scheduled for three hours per day, five days per week, thirty-six weeks per year for two years; or for two hours per day, five days per week, thirty-six weeks per year for three years. In either case, the total time is 1,080 hours.

Normally, the course is divided into two parts—Building Construction 1, and Building Construction 11, with Building Construction 1 being offered in the eleventh grade and Building Construction 11 in the twelfth grade. However, some schools offer the course three years—in the tenth, eleventh and twelfth grades, and divide the overall course into three parts—Building Construction 1, 11, and 111.

11. *Credit*

Students earn two units of credit for each year of training satisfactorily completed in the program.

111. *Requirements for Admission*

Persons admitted to the program should be in good physical condition, have an interest in construction and enjoy working with their hands. Most schools require that applicants be administered examinations prior to enrollment to determine their interest in and suitability for this type of work. Some schools require applicants to be interviewed by a counselor or instructor prior to admission. Every effort is made to help the student select the trade that best suits his interests and abilities.

SPECIFIC OBJECTIVES OF THE TRADES AND INDUSTRIES BUILDING CONSTRUCTION PROGRAM

Upon completion of the Building Construction Program, the student is expected to:

1. Be able to perform basic manual skills common to the carpentry trade.
2. Be safety conscious and use safe work practices at all times.
3. Be able to correctly use the essential measuring instruments and other tools used in the carpentry trade.
4. Be able to make basic sketches for residences and commercial buildings.
5. Be able to interpret and use blueprints and working drawings.
6. Be able to solve construction problems related to building residences and commercial buildings.
7. Conserve materials and properly care for tools and equipment.
8. Be acquainted with the job opportunities available in the trade.
9. Know proper procedures for presenting complaints related to working conditions, salaries, etc.—to know the importance of following the proper "chain of command" to solve these problems.
10. Understand the wage structure and the factors that effect it.
11. Understand basic factors relating to building cost estimating, cost control, and discounts.
12. Have a general knowledge of the legal liabilities and tax responsibilities of a contractor.

DUTIES OF A CARPENTER

Carpenter (Const.) 860.381. Constructs, erects, installs, and repairs structures and fixtures of wood, plywood, and wall board, using carpenter's handtools and power tools, and conforming to local building codes. Studies blueprints, sketches, or building plans, for information pertaining to type of material required, such as lumber or other materials. Prepares layout, using rule, framing square, and calipers. Marks cutting and assembly lines on materials, using pencil, chalk, and marking gage. Shape materials to prescribed measurements, using saws, chisels, and planes. Assembles cut and shaped materials and fastens them together with nails, dowel pins, or glue. Verifies trueness of structure with plumb box and carpenter's level. Erects framework for structure and lays subflooring. Builds stairs and lays out and installs partitions and cabinet work. Covers subfloor with building paper to keep out moisture and lays hardwood, parquet, and wood-strip block floors by nailing floors to subfloor or cementing them to mastic or asphalt base. Applies shock-absorbing, sound-deadening and decorative paneling to ceilings and walls. Fits and installs prefabricated window frames, doors, doorframes, weather stripping, interior and exterior trim, and finish hardware, such as locks, letter drops and kick plates. Constructs concrete forms and pouring chutes. Erects scaffolding and ladders for assembling structures above ground level. May weld metal parts to steel structural members. When specializing in particular phase of carpentry is designated according to specialty as LAYOUT CARPENTER, PARQUETRY-FLOOR LAYER. When specializing in finish carpentry, such as installing interior and exterior trim, building stairs, and laying hardwood floors, is designated FINISH CARPENTER. When erecting frame buildings and performing general carpentry work in residential construction is designated FRAMING CARPENTER, HOUSE CARPENTER.

OUTLINE OF COURSE CONTENT

INTRODUCTION

The following pages contain an outline of the information that the curriculum committee felt should be included in the two-year carpentry course. The outline is divided into two sections, Building Construction 1 and Building Construction 11. The instructor will need to determine which information to cover the first year and which to cover the second year. The manner in which the course is divided will depend upon time limitations and the methods of instruction used. For example, with programs in which students build a house each year, most of the practical exercises contained in the outline can be covered twice in the two years of the course.

Information contained herein is not necessarily in the sequence in which it should be taught. The instructor should teach the material in the order which would be most convenient for him. If lack of time is a problem, less important topics should be deleted from the course. The outline is quite flexible, and instructors should feel free to rearrange the information contained, add to it or delete sections from it as they desire to make it fit their needs.

An orientation section should be included at the beginning of both years, preferably with an emphasis on safety and objectives of the program in the first year, and an emphasis on safety and job opportunities in the second year.

BUILDING CONSTRUCTION 1

1. *Orientation*

New students entering the carpentry course may not be acquainted with the carpentry trade. Therefore, the purpose of orientation is to help the student learn the nature of carpentry work, the objectives of the course and the behavior and quality of work expected of persons taking the course.

A. History of the trade
B. Duties of a carpenter
C. Relationship of carpentry to other trades (see pages 24-25 in Appendix).
D. Employment in the trade
   1. Job opportunities
   2. Apprenticeship programs
   3. Advancement prospects
   4. Outlook for future of trade
   5. Current wage scales and prospects for future
E. Purpose and objectives of the Building Construction course (see page 3).
F. Safety (Recommended teaching unit: Safety Handbook, A Guide for Trade and Industrial Education Programs, 1968, published by Vocational Education Media Center, Clemson University. Copies available to teachers through State Supervisor of Trades and Industries).
   1. General shop safety
   2. Protective clothing and equipment
   3. Handling materials
   4. Injuries resulting from falls and lifting
   5. Importance of good housekeeping
   6. Proper use of tools and equipment
   7. Importance of proper conduct
   8. Importance of being safety conscious

11. *Blueprint Reading and Sketching* (Suggested textbook: Building Trades Blueprint Reading, Delmar Publishers, Albany, New York.)

The purpose of this unit is twofold, first to prepare the student to interpret drawings similar to the ones he will be required to follow in his work, and second to enable the student to become proficient in making simple shop sketches which are used quite frequently in the trade for building garages, home workshops, remodeling old houses, etc.

A. Introduction to blueprint reading
   1. Purpose and use of working drawings
   2. Drawing interpretation
      a. Placement of views
      b. Dimensions
      c. Invisible edges
      d. Circles and arcs
      e. Sectional views
B. Drawing interpretation problems
   1. Construction shack blueprints
   2. Structural members of a frame structure

3. Roof framing members
4. Doors, windows and exterior walls
5. Framing plans and elevations
6. Rough openings, roofs and floor framing
7. Details and sections
8. Piers and floors
9. Windows, lintels and doors
10. Wall plates, roofs and rafters

C. Shop drawings—Students should not be expected to become draftsmen in a Building Construction course, but should become able to make usable shop sketches. The tools and equipment required for teaching this unit will depend upon the depth the instructor plans to go in the subject. The only tools required for simple shop sketches are grid paper and a pencil, but a few additional items such as a drawing board, a T-square, triangles and a French curve could prove useful. Since only shop sketches and not working drawings are to be done, students will not need a set of drawing instruments. However, the instructor could keep a complete set of drawing equipment and instruments in the classroom for his own use, and show students how the various instruments are used in making working drawings.
1. Tools for sketching
2. Sketching straight lines
3. Sketching circles, arcs, irregular shapes
4. Making a working sketch
5. Isometric sketches
6. Sketching angles in isometric
7. Dimensioning an isometric sketch
8. Sketching circles and arcs in isometric
9. Sketching irregular shapes in isometric
10. Reading three-view drawings
11. Symbols for floor plans
12. Laying out simple floor plans

111. *Related Mathematics*

A. Review of basic math—Time required in review will vary from school to school depending upon the background of students entering the program. To determine what information should be covered in review, the instructor should administer some type of test which will identify the math weaknesses of students.
1. Working with whole numbers
   a. Addition
   b. Subtraction
   c. Multiplication
   d. Division
2. Working with fractions
   a. Reading fractions
   b. Addition of fractions
   c. Subtraction of fractions
   d. Multiplication of fractions
   e. Division of fractions
   f. Changing fractions to decimals
3. Reading and using a twelve inch ruler

B. Conversion problems
1. Inches to feet/feet to inches
2. Feet to yards/yards to feet
3. Cubic feet to cubic yards/cubic yards to cubic feet

C. Percentage problems
   1. Computing simple percentage problems
   2. Calculating interest on loans (inform students of types of loans, where available, steps in securing loans, and cautions to observe in borrowing money).
   3. Calculating discounts
   4. Calculating penalties
   5. Calculating profits and losses
   6. Figuring sales tax
D. Record keeping
   1. Importance of good record keeping
   2. Methods of bookkeeping used by carpenters
E. Purchasing Insurance
   1. Importance of insurance
   2. Types
F. Area calculations (Use problems related to carpentry. Example: For calculating the area of a rectangle, have students figure the floor covering requirements for a room with specified dimensions).
   1. Square
   2. Rectangle
   3. Circle
   4. Triangle
G. Measurement
   1. Length measurements
   2. Square measurements
   3. Board foot measurements
   4. Cubic measurements
   5. Weight measurements
H. Ratio and proportion principles
   1. Ratio and proportion
   2. Applications to carpentry
I. Mathematics required for using the framing square
   1. Reading framing square tables
   2. Uses of framing square
   3. Exercises (to be assigned by instructor)

IV. *Hand Tools and Equipment*

A. Squares
   1. Try square
   2. Try and miter
   3. Framing
   4. Combination
   5. Sliding "T" bevel
B. Straight edge
C. Plumb bob
D. Marking tools
   1. Chalk line
   2. Regular pencil
   3. Scratch awl
   4. Scriber
   5. Compass and dividers
   6. Butt guage

I. Portable belt sander
J. Portable finishing sander
K. Portable planer
L. Shaper
M. Bench or pedestal grinder
N. Jointer

VI. *Site Layout and Foundation Construction*

In programs where the class builds a house, first year students should be assigned the less complicated jobs and the more complicated tasks should be assigned to second year students. Although all students probably cannot be involved in doing every task in site layout and foundation, all should become familiar with the steps that are necessary in getting the site cleared and the foundation prepared.

A. Site layout
   1. Selecting location
   2. Clearing
   3. Setting up transit level
   4. Using water level
   5. Locating lot lines
   6. Locating building line
   7. Constructing batter boards
   8. Locating corners of buildings
   9. Testing corners for squareness
   10. Locating offsets, chimneys and piers
   11. Locating line of excavation
   12. Excavating for footing
B. Foundation construction
   1. Building foundation forms
   2. Pouring footing
   3. Pouring foundation walls
   4. Installing drain tile
   5. Locating and installing anchor bolts
   6. Installation of termite shields
   7. Treating foundations for termites

VII. *Floor Framing*

A. Sills
   1. Types—solid, laminated, and "T"
   2. Determining sizes needed
   3. Installing
B. Girders
   1. Types
   2. Determining sizes needed
   3. Installing
C. Ledgers
   1. Purpose
   2. Determining sizes needed
   3. Installing
D. Stirrups
   1. Purpose
   2. Types
   3. Installation

E. Headers
   1. Purpose
   2. Determining sizes needed
   3. Installation
F. Floor joist
   1. Proper spacing
   2. Determining sizes needed
   3. Installation
G. Bridging
   1. Use
   2. Types
   3. Proper spacing
   4. Installation
H. Subflooring
   1. Uses
   2. Materials used
   3. Proper spacing
   4. Installation

VIII. *Wall Framing*

A. Installation of sole plate
B. Studding
   1. Types
   2. Spacing
   3. Installing
C. Framing openings for windows and doors
   1. Determining dimensions of required opening
   2. Procedure for framing openings
   3. Installation of cripple studs
   4. Installation of headers
D. Special posts
   1. Corner
   2. Partition
   3. Window
   4. Door
E. Bracing
   1. Types
   2. Installation
F. Wall plates
   1. Purpose
   2. Installation
G. Wall sheathing
   1. Purpose
   2. Materials used
   3. Diagonal sheathing
   4. Installation
H. Ceiling joists
   1. Purpose
   2. Spacing
   3. Determining size requirements
   4. Framing for openings for chimney, stairways, etc.

IX. *Roof Framing*

A. Types of roofs
   1. Shed
   2. Gable
   3. Gambrel
   4. Hip
   5. Mansard
B. Cutting rafters
   1. Types of rafters
   2. Laying off with framing square
   3. Use of a layout tee
C. Installation of roof framing

X. *Roofing*

A. Sheathing
   1. Types of materials used
   2. Installation
B. Application of roofing felt
   1. Types of roofing felt
   2. Application
C. Flashing
   1. Types of materials used
   2. Installation on eaves and rake
   3. Installation around chimneys, vent pipes, etc.
D. Selecting and installing covering
   1. Types of shingles and other roof covering
   2. Application of roofing material
E. Special roofing problems—covering around dormers, chimneys, skylights, etc.

XI. *Exterior Finishing*

A. Windows and exterior doors
   1. Selecting doors and windows
   2. Installation of frames
   3. Installing doors and windows in frames
B. Wall coverings
   1. Types of materials used
      a. Masonry
      b. Aluminum siding
      c. Clapboard and beveled siding
      d. Novelty siding
      e. Wood shingles
      f. Plywood
   2. Advantages and disadvantages of each
   3. Procedure of applying each
C. Trim work
   1. Trim problems
      a. Molding installation
      b. Porch trim
      c. Cornice trim
      d. Installing louvers and vents
      e. Front entrances

2. Types of materials used
3. Installation
4. Painting

XII. *Insulation*

A. Purposes
   1. Keeping heat in or out
   2. Control condensation
   3. Retard spread of fire
   4. Sound proofing
B. Types
   1. Blanket
   2. Batt
   3. Granulated, cellular and fibrous
   4. Slab or block
C. Insulation value of various insulating materials
D. Determining insulation required
E. Installation of insulation materials
F. Installing storm doors and windows

BUILDING CONSTRUCTION 11

1. *Orientation*

Orientation in Building Construction 11 should consist mainly of a review of the information covered in orientation in Building Construction 1 with emphasis on the following topics:

A. Purpose and objectives of the course (see page 3)
B. Employment picture in the trade
   1. Job opportunities
   2. Apprenticeship programs
   3. Advancement prospects
   4. Outlook for future of trade
   5. Salaries and salary prospects for future
C. Safety (Recommended teaching unit: Safety Handbook, A Guide for Trade and Industrial Education Programs, 1968, published by Vocational Education Media Center, Clemson University. Copies available to teachers through State Supervisor of Trades and Industries).
   1. General shop safety
   2. Protective clothing and equipment
   3. Handling materials
   4. Injuries resulting from falls and lifting
   5. Importance of good housekeeping
   6. Proper use of tools and equipment
   7. Importance of proper conduct
   8. Necessity for being safety conscious at all times.

11. *Blueprint Reading*

The blueprint reading of Building Construction 11 should be a continuation of the information covered in Building Construction 1. In addition to reviewing the blueprint reading and shop drawing discussed in Building Construction 1, the following information should be discussed if time permits.

A. Reading scaled drawings
B. Specifications
C. Dimensions
D. Elevation drawings
E. Wall sections
F. Interpreting elevation drawings (review)
G. The plot plan
H. Foundation drawings
I. Plan symbols and indications
J. Schedules
K. Interpreting basement plans
L. Floor frame plan
M. Interpreting floor plans (review)
N. Roof frame plan
O. Details—cornice
P. Details—walls
Q. Details—windows and doors
R. Details—dormers and louvers

S. Details—stairs
T. Details—fireplace
U. Details—cabinets
V. Interpreting detail drawings (review)
W. Use of quantity and material lists

III. *Related Mathematics*

The use of the mathematics taught in Building Construction 1 will continue in Building Construction 11 as students draw house plans, solve construction problems and estimate costs. In addition to the information taught in Building Construction 1, the information which follows should prove beneficial to persons completing the carpentry program.

A. Record keeping (review)
   1. Importance
   2. Methods of bookkeeping
B. Purchasing insurance (review)
   1. Importance
   2. Types of insurance
   3. Calculating needs
C. Volume calculations
   1. Cubes
   2. Rectangular solids
   3. Cylinders
D. Powers and roots
E. Applied plane trigonometry
   1. Reading angles with protractor
   2. Right triangle
      a. Pythagorean theorem
      b. Exercises in solving for length of unknown side when two sides are known
F. Mathematics required for using the transit (or builder's level if transit isn't available).
   1. Methods and steps of using transit
   2. Exercises in proper use of transit
G. Review of use of framing square
H. Estimating (See pages 32-38 in appendix for sample estimators checklist). Students should be given a set of house plans and a copy of the estimators checklist and be required to find the estimated cost of building a house.
   1. Phase 1 — Preparation, site work, foundation and masonry costs.
   2. Phase 11 — Dry-in stage, mechanics rough-in.
   3. Phase 111 — Finish carpentry, finish work, appliances and sundry costs.
   4. Phase IV — Interior and exterior decoration and final finish work costs.

IV. *Use of Power Tools* (See pages 51-91 in appendix)

A. Review of use of power tools used in Building Construction 1.
   1. Radial arm saw
   2. Table saw
   3. Band saw
   4. Router
   5. Pneumatic hammer
   6. Portable hand drill
   7. Portable circular saw

8. Saber saw
9. Portable belt sander
10. Portable finishing sander
11. Portable planer
12. Shaper
13. Bench or pedestal grinder
14. Jointer

B. Other power tools
1. Jig saw
2. Drill press
3. Disk sander
4. Belt sander
5. Planer

V. *Site Layout and Foundation Construction*

In programs where the class builds a house, students enrolled in Building Construction 11 should be assigned the more complicated steps in site layout and foundation construction. The less complicated tasks should be assigned to first year students. Although all students probably will not be involved in every step in site clearance, layout and foundation construction, all should become familiar with the steps to be followed in completing this phase.

A. Site layout (Review from Building Construction 1)
1. Selecting location
2. Clearing
3. Setting up transit level (assign exercises in using)
4. Using water level
5. Locating lot lines
6. Locating building line
7. Constructing batter boards
8. Locating corners of buildings
9. Testing corners for squareness
10. Locating offsets, chimneys and piers
11. Locating line of excavation

B. Foundation construction (Review)
1. Building foundation forms
2. Pouring footing
3. Pouring foundation walls
4. Installing drain tile
5. Locating and installing anchor bolts
6. Installation of termite shields
7. Treating foundations for termites

VI. *Floor Framing* (Review of information covered in Building Construction 1)

A. Sills
1. Types—solid, laminated and "T"
2. Determining sizes needed
3. Installing

B. Girders
1. Types
2. Determining sizes needed
3. Installing

C. Ledgers
   1. Purpose
   2. Determining sizes needed
   3. Installing
D. Stirrups
   1. Purpose
   2. Types
   3. Installation
E. Headers
   1. Purpose
   2. Determining sizes needed
   3. Installation
F. Floor joists
   1. Proper spacing
   2. Determining sizes needed
   3. Installation
G. Bridging
   1. Use
   2. Types
   3. Proper spacing
   4. Installation
H. Subflooring
   1. Uses
   2. Materials used
   3. Proper spacing
   4. Installation

VII. *Wall Framing* (Review of information covered in Building Construction 1)

A. Installation of sole plate
B. Studding
   1. Types
   2. Spacing
   3. Installing
C. Framing openings for windows and doors
   1. Determining dimensions of required openings
   2. Procedure for framing openings
   3. Installation of cripple studs
   4. Installation of headers
D. Special posts
   1. Corner
   2. Partition
   3. Window
   4. Door
E. Bracing
   1. Types
   2. Installation
F. Wall plates
   1. Purpose
   2. Installation
G. Wall sheathing
   1. Purpose
   2. Materials used
   3. Diagonal sheathing
   4. Installation

H. Ceiling joists
   1. Purpose
   2. Spacing
   3. Determining size requirements
   4. Framing for openings for chimney, stairways, etc.

VIII. *Roof Framing*

A. Types of roofs (Review of information covered in Building Construction 1)
   1. Shed
   2. Gable
   3. Hip
   4. Gambrel
   5. Mansard
B. Roof plans
   1. Location of main framing members (ridge, hips, valleys and jacks)
   2. Dimensions – overall and overhang
   3. Location of intersections
   4. Exercise in drawing roof plans – Supply students with house plans and have each draw a usable plan for framing the roof of the house.
C. Rafters
   1. Types
   2. Laying off with framing square
   3. Use of layout tee
   4. Exercises in rafter cutting – assign students sufficient exercises in laying out and cutting rafters for them to become proficient in these two jobs.
D. Installation of roof framing – If Building Construction 1 and 11 classes are building a house, have second year students be responsible for constructing the roof framing.
E. Special roof framing problems (Review)
   1. Chimney saddles
   2. Bay window roof framing
   3. Truss roof
   4. Dormer roofs

IX. *Roofing* (Review of information covered in Building Construction 1)

A. Sheathing
   1. Types of materials used
   2. Installation
B. Roofing felt
   1. Types
   2. Installation
C. Flashing
   1. Types of materials used
   2. Installation on eaves and rake
   3. Installation around chimneys, vent pipes and similar items.
D. Selecting and installing roofing
   1. Types of shingles and other roof covering
   2. Application of roofing material
E. Special roofing problems – covering around dormers, chimneys, skylights and similar items.

X. *Exterior Finishing* (Review of information covered in Building Construction 1)

A. Windows and exterior doors
   1. Selecting doors and windows
   2. Installation of frames
   3. Installation of doors and windows in frames
B. Wall coverings
   1. Types of materials used
      a. Masonry
      b. Aluminum siding
      c. Clapboard and beveled siding
      d. Novelty siding
      e. Wood shingles
      f. Plywood
   2. Advantages and disadvantages of each
   3. Procedure of applying each
C. Trim work
   1. Trim problems
      a. Molding installation
      b. Porch trim
      c. Cornice trim
      d. Installing louvers and vents
      e. Front entrance trim
   2. Types of materials used
   3. Installation
   4. Painting

XI. *Insulation* (Review of information covered in Building Construction 1)

A. Purposes
   1. Keeping heat in or out
   2. Control condensation
   3. Retard spread of fire
   4. Sound proofing
B. Types
   1. Blanket
   2. Batt
   3. Granulated, cellular and fibrous
C. Insulation values of various insulating materials
D. Determining insulation requirements
E. Installation of insulation materials
F. Installation of storm doors and storm windows

XII. *Interior Finishing*

A. Interior walls
   1. Materials commonly used
   2. Installation of furring strips
   3. Application of materials
B. Ceilings
   1. Materials commonly used
   2. Installation of furring strips
   3. Installation of ceiling material

5624

C. Installation of door frames
D. Interior trim
   1. Installation of door trim
   2. Installation of window trim
   3. Installation of baseboard
E. Floors—Students should obtain experience in installing the types of flooring materials which are most commonly installed by carpenters. They should also become familiar with the types of materials which are installed by other flooring specialists and know the type of base required for installing these different types of materials (carpet, tile, linoleum, terrazzo).
   1. Types of flooring materials commonly applied by carpenters.
      a. Advantages and disadvantages of different types
      b. Procedure for applying and finishing each type
   2. Types of flooring commonly applied by specialists other than carpenters
      a. Advantages and disadvantages
      b. Type of base needed for each
F. Doors
   1. Types
      a. Style
      b. Materials used to make
   2. Installation of interior doors
   3. Installation of locks
   4. Installation of door stops
G. Cabinets
   1. Custom built on the site by cabinet maker
   2. Installation of factory built cabinets
H. Interior molding
   1. Types
   2. Installation
I. Staircases
   1. Types
   2. Staircase terminology
   3. Planning staircases
      a. Safety considerations
      b. Calculations necessary for staircase layout
   4. Use of framing square in laying out
   5. Construction of staircase
   6. Installation of preconstructed disappearing stairways

XIII. *Recent Advances in Building Construction*

An outline is not included for this section. However, the instructor should be alert to new materials and techniques of building being introduced and keep a file of literature on these for use with this section of the course. Student participation in this section should be encouraged by having them bring to class newspaper and magazine articles, catalog descriptions, and sales literature on any recent advances in the field.

XIV. *Locating and Securing a Job*

A. Finding information on available jobs
B. Considerations to ponder before seeking a job
C. Arranging for the interview
D. Preparing for the job interview
E. Being interviewed

XV. *Human Relations*

A. Importance of being able to get along with other people
B. Problems in interpersonal communications
C. Personal qualities required to be able to get along with other people
D. Understanding one's self
E. Understanding the actions and feelings of other people
F. Best procedures to follow in trying to solve working condition problems

5626

APPENDIX

RELATIONSHIP OF CARPENTRY TO OTHER TRADES

Carpentry is an ancient craft, yet its role in the building industry is still one of the most important. Carpenters work mainly with wood materials to construct buildings. Although many buildings are presently being constructed of masonry and materials other than wood, the carpenter still plays a major role in laying out for the building and installing doors, windows, etc.

The carpenter does much of the work in constructing a building, but major portions must be performed by other skilled craftsmen. The plumber, the electrician, the brick layer, the tilesetter, the cabinet maker, the sheet metal worker, the air conditioning and heating technician, and the painter are all necessary to complete a residence or other building.

A building contractor (many times a former carpenter) who bears the overall responsibility for the construction job coordinates the work of all the people involved in the project. He "subs" out (subcontracts) the different phases of building to plumbing, heating, electrical and other contractors. He sees to it that they complete the job according to the set of specifications. The completed building will be of better quality if these craftsmen cooperate with each other and carry out the work assigned to each.

All of the subcontractors will not be present at the construction site at all times and probably all would not be there at any one time. The carpenter must reach a certain stage in completion before the plumber can begin, the plumber a certain stage before the tilesetter can begin, and so on down the line. The stages of preparation for each trade to complete before the next one begins is pretty clearly understood by each group, and normally things work out smoothly. But, when one tradesman fails to complete his part of the job, confusion and poor workmanship are the result. Although the sequences in which different tradesmen arrive on the scene to do their work varies to a certain extent (depending upon the type of construction), the general order in which they might work is as follows:

1. Contractor – completes necessary paperwork–planning, estimate of cost, contract, purchase of builder's risk insurance, financial arrangements, etc.

2. Grading contractor – clearing of lot and preliminary grading.

3. Carpenter – layout for foundation (puts up batterboards, lines, etc.)

4. Grading contractor – excavates for foundation.

5. Laborers – digs out for the footings for foundation.

6. Carpenters – pours footings for foundation.

7. Bricklayer – lays block or brick foundation walls and piers.

8. Carpenter – "dries in" house (at a stage where work can be performed inside in rainy weather).

9. Plumber – "roughs in" plumbing (in case of houses built on concrete slabs, the plumber would "rough in" the plumbing before the carpenter).

10. Electrician – "roughs in" electrical system.

11. Heating and air conditioning technician and sheet metal worker – "roughs in" heating system.

12. Bricklayer – completes brickwork (veneers with brick if called for, lays steps, chimneys, fireplaces, etc.).

13. Carpenter – applies exterior siding (if not brick veneered), completes exterior trim and interior trim, applies paneling and sheetrock for interior walls, lays wooden flooring if required, completes formwork for pouring concrete floors for carport, basement, etc.

14. Cabinet maker (or finished carpenter when cabinet maker is not available) – installs cabinets.

15. Tilesetter – completes tilework.

16. Plasterer or dry wall finisher – prepares walls and ceiling for painting.

17. Cement finisher – pours and finishes concrete floors.

18. Plumber – installs plumbing fixtures.

19. Painter – applies paint or wall paper to interior walls, applies paint to exterior trim.

20. Electrician – completes electrical work.

21. Floor finisher – sands and applies finish to wooden floors, lays floor covering where required.

22. Carpet installer – installs carpet where required.

5629

THE USE OF LIVE PROJECTS

All trade instructors desire to have a quality instructional program. Building Construction instructors are no exception, but many have hindrances preventing them from having a quality program. One of these hindrances is the high cost of building materials which restricts the use of repetitive exercises in which building materials are consumed as a means of instruction. Another is the fact that the program is broader in scope than most other programs and to teach everything that needs to be taught is most difficult. And finally, many carpentry instructors are hampered by their classes being required to perform maintenance activities which have little, if any, instructional value.

One way of overcoming these hindrances is to have the carpentry classes build a house each year. In several programs, in this state, students build houses valued at from $12,000 to $22,500 which the school then sells or rents at the going market value.

By having the class build a house, the high cost of purchasing building materials ceases to be a problem because when the school sells the house it should more than clear the cost of building materials. The problem of teaching everything that needs to be taught in the course is also eliminated, because students can receive instruction and experience in practically every phase of building. The third hindrance, that of performing maintenance work, should be eliminated also, since students will be busy doing worthwhile work and instructors will not need to take on meaningless maintenance activities.

Students are involved in drawing up the house plans, writing up bills for materials, laying out for foundations, constructing the house and working with subcontractors. The "subcontractors" are often Trades and Industries classes in electricity, air conditioning, brick masonry, and painting and decorating. Home economics and family living classes sometimes aid in planning the house and decorating it once it is completed. Horticulture classes could be used to do the landscaping. Through first-hand experience, students learn of the problems encountered in planning, financing, laying out and building a house.

The use of "live" projects in this manner seem to make the instructional program more effective and economical to operate. In spite of this fact, instructors sometimes find it difficult to secure the approval of their school authorities to build houses. Understandably, school administrators and others have been reluctant to approve building a house because of a fear that the school will lose money on such an endeavor. Administrators' resistance should subside if the instructors can show the benefits of having the students build a house and the small danger of losing money on the project. Actually, the risk of losing money is quite small. Perhaps the instructor could take his principal or director to visit a Building Construction Program which uses "live" projects and have the instructor and his school administrators explain the procedures they follow. After seeing such a program in operation and recognizing its benefits, reluctant administrators might desire to see a similar program initiated in their school.

Both instructor and administrators should see to it that the instructional value of such a project does not suffer due to the desire to make a huge profit from the sale of completed houses. The instruction which can be derived should be the primary motive for building. If a house is to be built, then certain guidelines should be observed to prevent financial and other difficulties from arising. A good set of guidelines to follow are on pages 27-30 of this publication. The section is entitled "Policies and Procedures for the Operation of Program of Real Work in All Connecticut Vocational-Technical Schools" and is reprinted in its entirety with permission of the Connecticut Department of Education.

THE CONNECTICUT PLAN FOR CARPENTRY AND MASONRY CLASSES OF VOCATIONAL SCHOOLS TO BUILD RESIDENCES

This section, reprinted by permission of the Connecticut State Department of Education, in addition to giving the procedures to be followed, discusses fully the problems and possible weaknesses involved in doing "live projects" for the public and explains how to overcome them. Instructors considering building houses should study this section and discuss its contents with their administrators and other appropriate school officials before beginning. Instructors should adhere closely to these guidelines and other restrictions imposed by the proper authorities.

Policies and Procedures for the Operation of Program of
'Real Work in All Connecticut Vocational-Technical Schools'

PURPOSE

This section is intended to provide a policy framework within which 'Real Work' experiences as an element of instruction may be organized and maintained to best advantage in the Vocational-Technical Schools.

JUSTIFICATION OF 'REAL WORK' PROGRAM

Justification of school participation in the field of actual commercial work is that such work is necessary for valid and complete training of the student. If a school program aims to provide, as a part of its offerings, reasonably good training in trade judgment and operative skills, actual work under usual conditions is obviously essential. Where such 'real work' experiences are not provided, vitally needed values are lost or at least greatly diminished. The history of apprenticeship, both ancient and modern, points to a continuing recognition that experiences on 'real work' are imperative if good vocational preparation is to result.

DIFFERENCE IN BUSINESS AND SCHOOL OBJECTIVES

There are, however, important differences between the contractor or industrialist engaged in private business and the Vocational-Technical School's total educational program. These differences need to be fully understood by both administrative and instructional staffs otherwise the objectives may become confused and the program correspondingly abortive. Private business is primarily organized for profit and whatever training may be carried on is more or less secondary or incidental. The Vocational-Technical School on the other hand is organized for education and vocational training in proper balance. Its primary business, therefore, is the development of human values.

Obviously, then, the producing of 'commercial jobs' is not the primary function of a Vocational-Technical School and should never become a dominating factor in school outlook or policy. On the other hand, 'real jobs' must be recognized for what they are, important media of training, and not dismissed from mind merely because it can be shown that the school is not expressly engaged in producing articles for sale. In the practical phases of the training there is very evident relationship between the 'quality of the job' and the kind of instruction the student receives.

ASPECTS RELATED TO THE PUBLIC INTEREST

An element which usually needs clarification in the public mind is the somewhat natural assumption that the Vocational-Technical School may be a threat to privately organized business or industry because of the amount of commercial work it may do.

This impression is further magnified if a school, as a general practice, contracts for such work at rates considerably below usual prices. As a rule, however, this feeling grows out of general rather than specific information. An example will perhaps help to clarify the extent in reality of such competition. In a typical school electrical shop, the total amount of work done during a recent year amounted to approximately $3,600.00. This included a wide range of work such as house wiring, motor repairing and a limited amount of industrial electrical installation. In the same area served by this school, there were six contractors in the electrical field. Assuming that each contractor has secured an equal share of this work, it would have amounted to $600.00 each. If those contractors realized a gain of 10% above operating cost their total business profit in each case would have been $60.00 higher for that year if the school had not participated in electrical contracting. Furthermore, it is well to remember that this same school employed in its electrical department two electrical tradesmen who were trained as instructors, one of whom had previously been in business as a contracting electrician. Both of these men, if released from their present work, might well enter the contracting field themselves and thus increase the competition to a much greater extent than that represented by the school's production work needs in this trade. In addition, most of the journeymen employed by these local contractors received their basic training in the electrical trade at the Vocational-Technical School.

RELATION TO COST OF TRAINING

Whether vocational training is provided by private industry and paid for by private funds or carried on under public auspices and paid for by public funds, costs are in both cases evidently necessary. Contractors train apprentices on 'real work'. In doing this, they achieve three general objectives:

a. Provide valid training for the apprentice.
b. Conserve material costs.
c. Promote completion of the job.

It is unlikely that any employer would approve having apprentices trained on exercise work to be scrapped after completion. This would be an expensive and perhaps futile form of apprentice training from the standpoints of materials, time and human values. The Vocational-Technical School is in much the same position so far as its practical training is concerned. The school needs 'real work' to provide valid instruction and when properly selected and organized such work results in:

a. Value for the student in more effective training in less time.
b. Material costs reduction.
c. Work produced which contributes to the public and general welfare.

In both instances time, materials and human values are conserved, the product resulting from the training has a sale value and overall costs to the public are to that extent reduced.

INTERNAL USE OF SCHOOL FACILITIES

Another element which has public implication is the extent to which school facilities may be used in producing goods and rendering services for the benefit of its own employees or students. It is more or less apparent that such practice if uncontrolled will seriously impair training effectiveness and perhaps endanger public confidence as well.

GENERAL PROVISIONS FOR PRODUCTION WORK AUTHORIZATION

All production work as hereinafter described or classified must be properly authorized. Such authorization shall be in accordance with detailed instructions as outlined in Section 11 of this Bulletin or such later revisions of the same as may be established.

Before accepting a production job of more or less detailed character, suitable plans, specifications and details should be on hand—

a. Provided by customer, acceptable to school.
b. Provided by the school, approved and paid for by customer.

following the above practice, job estimating and organization is improved and instruction thereby prompted. If the school develops such plans, the students benefit and the school is also fairly compensated for preparatory engineering essential to completion of the job.

Where a customer agrees to supply materials or fabricated parts for all or any portion of a production job, the conditions of such agreement should be stated on the production order or be included in a signed contract upon which such order is based. Materials when supplied by a customer should meet acceptable standards for the work to be done and to be delivered by the customer or his agent to the site or at the school at time or times as may be required for most effective instructions and progress of the work. As a matter of fair business practice, the school or its agents should not enter into any price arrangements or negotiations having to do with the actual purchasing of such materials for a customer's job. The school, however, may supply a customer with information concerning kinds and quantities of materials needed for a prospective job.

CONTRACT IMPLICATIONS AND RESPONSIBILITIES

It should be kept in mind that all production work when accepted, regardless of size or character, constitutes a contract by the State with a customer. A customer may be any person, partnership, corporation or institution. In this connection, it may be noted that, except for the courtesy discounts recommended, school employees or students having work done by the school are, therefore, to be considered as customers in the usual sense of that term.

Directors are responsible for all production work carried on in the schools under their charge and approval and general supervision of such work shall directly or indirectly include the following on their parts:

Approval

a. Examination and approval of customer's credit.
b. Examination and approval of plans and specifications including licenses and permits.
c. Examination and approval of estimate and prices.
d. Examination and approval of contract forms and procurement of required signatures.
e. Issuance of production order authorizing that the work be started.

Supervision

a. Follow up progress of work by frequent inspections and instructor contract.
b. Keep instructors conscious of need for following plans and specifications meticulously and in case of change, securing the owner's direction in writing for such change, using the prescribed form for this purpose.
c. See that partial payments, if called for, are promptly billed in the manner as prescribed in Section 11 of this Bulletin.
d. See that instructional objectives and effective teaching methods are employed and good public relations maintained.
e. Encourage prompt job completion and require that all production orders be completed in accordance with accounting procedures and turned in to the Central Office for billing without delay.

In like manner, instructors are responsible to the school director for carrying out their responsibilities in accordance with policies and procedures as herein outlined and provided.

CLASSIFICATION OF CHARGES AND DISCOUNTS

General

In order to safeguard values and establish reasonable uniformity, the following provisions and classification of charges shall govern 'production work' commitments in the Vocational-Technical Schools.

The extent of discounts, within the ranges as hereinafter stated, will obviously depend upon the nature of the job and the attendant conditions and circumstances. It is not intended that discounts must apply in all cases and certainly it is not intended that the maximum of the range should become the rule. The actual discounts which will reasonably apply in each case is the responsibility of the school director as a part of required approval of job estimates and production orders.

Production Work for the General Public

Labor charges: Production work price of labor to the general public should be reasonably commensurate with prevailing trade price. Any downward adjustment to meet special school training conditions should not exceed 10 to 25% on labor only. Unless some such special conditions exist which reasonably justify reduced labor prices, the average journeyman rate per hour of the respective trade should prevail.

Material charges: The general public should be charged retail prices for materials used in production work when furnished by the school. The retail price is the price charged to the public and is distinguished from the net price or wholesale price with which the school, industrial plant or contractor is favored. The difference or monetary gain helps to pay for the direct costs of handling materials and the indirect overhead costs of maintaining a business. In trades where the general public can purchase materials at the same price as a contractor or the school, a 10% handling charge should be made if the school is required to furnish the materials.

Direct Sales: Direct sales to the public shall be avoided except in minor cases of accommodation or emergency character or sales of necessary training supplies and tools to students. The school is not, nor should it be, engaged in retail selling to the general public."

Legal Basis of the 'Industrial Fund'
Connecticut Vocational-Technical Schools

Training on 'real jobs' has long been an established policy of the Connecticut Vocational-Technical Schools, particularly in the operative or skill phases of instruction. In recognition of the proven values of this policy and to properly provide for it, the General Assembly in 1929 enacted legislation establishing an 'Industrial Fund for the State Board of Education.' This law recorded in Chapter 223 of The Public Acts of that year reads as follows:

'SECTION 1. The sum of thirty-five thousand dollars is appropriated to establish an industrial fund for the state board of education in connection with its administration of trade and vocational education. Said board shall use said fund as a revolving fund for the purchase of manufacturing materials and supplies, in the establishment and continuance of such productive work as the trade and vocational schools shall perform in connection with the board's educational program for such schools.

SECTION 2. Claims against the state in behalf of said state board of education shall be paid by order of the comptroller drawn against said fund. The proceeds of all sales resulting from the productive work of the schools shall be paid into the state treasury and credited to said fund.

SECTION 3. At the end of each fiscal period, any balances in excess of thirty-five thousand dollars, as shown by the inventory of manufactured articles, material on hand or in process of being manufactured, bills receivable and cash balance, shall revert to the state treasury.'

Subsequent legislation expanded the original Act to authorize purchase of personal and contractual services and equipment properly chargeable to production contracts and has also increased the amount of the fund from time to time. Section 324b of the 1951 supplement to the General Statutes increased the working capital in the fund to one hundred and twenty thousand dollars."

SAMPLE ESTIMATORS CHECK LIST

The following form is a sample check list which can be used to estimate the cost of building a house. Additional copies for use by students can be made by making a thermofax ditto master and reproducing it on a spirit duplicator.

THE IMPORTANCE OF PUBLIC RELATIONS TO THE BUILDING CONSTRUCTION PROGRAM

The carpentry instructor can improve the effectiveness of his program and the other trade programs of the school by doing his share of the public relations work.

For a Building Construction Program to serve the purpose for which it was intended, certain people must know that the program exists and know the service it renders to the community.

First of all, the general public should know the value of the program. After all, the taxpayers are footing the bill for the program and have a right to know how their money is being spent. The public must have confidence in the school and its staff so that it will be willing to give financial and other support. Educators have found over the years that the schools in communities in which people have confidence in their school and its programs (due in part to good public relations) usually get the financial backing and cooperation necessary to offer a high quality educational program. Likewise they have found that schools in communities which do not have the trust and confidence of the people, do not get the support and backing they need. Simply stated, public trust is essential to having a good school.

In addition to the general public being familiar with trade programs, it is important that prospective students (who can profit from the training) be aware of the existence of the program and know how they can benefit by enrolling in it.

Prospective employers of graduates of the program also need to be informed about the program, be involved in planning the curriculum and know how the program can help solve the labor shortages that exist.

Public relations is not a small task, and the instructor should do his part and not leave it as the responsibility of the administration and central office.

Often, school people think of public relations as being the picture stories found in the Sunday newspaper, and far too many, regarding it as such, have used this as their sole means of public relations. Actually, the newspaper article is only one means of public relations (which may not be the best means).

For purposes of our discussion, public relations can be defined as "actions which contribute to mutual understandings and cooperative actions by the many groups involved in the promotion and execution of school programs."

One good means of public relations is to offer the kind of program that will adequately prepare students for employment. If the students in the program and graduates of the program are sold on its value, then the word of mouth advertising they will do will be of more value than the work a hired public relations man could do.

Another group that can help with public relations is a well selected and properly functioning advisory committee. For Building Construction Programs this committee should consist of carpenters, contractors and interested citizens. They should be called on to help plan the curriculum, formulate policies to be followed, and aid in securing employment for graduates of the program. Public relations should not be the major job for the advisory committee, but will result as a by-product of the overall work they do. Members of the advisory committee can help sell the program to other craftsmen in the field. Once these craftsmen are sold on the program, the battle of public relations is half won. The value of a properly functioning advisory committee cannot be overemphasized.

News stories for newspapers and radio and television stations can be useful in keeping the public informed. These news media are usually most appreciative of newsworthy stories furnished to them. Stories can be written by the instructor and submitted to the newspaper, or a reporter can be called on to come to the school to make photographs and write the story.

If the class builds a house, valuable publicity could be obtained when the school disposes of the house, whether this is done by public auction, sealed bids, or by placing it on the market with a definite price. Notices concerning the sale could be put in the newspapers and on

radio and television, with an "open house" being held for the public and prospective buyers to see the product of the students' work.

Instructors and administrators can also speak to civic clubs and other groups about their programs. Color slide sets and films, which are relatively easy to make, can be used to spice up these talks and make the presentation easier to deliver.

The instructor's key role in public relations work is to offer a sound instructional program which is worthy of public notice. He should remain alert to good opportunities for increasing the public's understanding of what he is doing. He should keep his eyes and ears open to public criticism (justified or unjustified) of his program and should correct situations for which criticism is justified. If the criticism was unjustified, then he should find some tactful means for clearing up the misunderstanding which prompted the criticism.

There is a final word of caution on the subject of public relations. The purpose of public relations should be to give all persons a clear and true picture of what is being done in our programs, and not to give a "sugar coated" and false version of what is being done. Information disseminated should always be factual. Although it is important to sell the program to the public, it is equally as important not to try to oversell it. The public is not easily fooled and can see through false information. Many attempts at public relations have failed for this reason.

PAMPHLETS AND PUBLICATIONS

Pamphlets available from American Plywood Association, 119 A Street, Tacoma, Washington 98401:

"Guide to Plywood Grades"
"Guide to Plywood Properties and Grades"

Catalogs available from Rockwell Manufacturing Company, The Rockwell Building, Pittsburgh, Pa. 15208:

"Portable Power Tools for Home or Professional Use"
"Rockwell Delta Industrial Woodworking and Metalworking"
"Rockwell Delta Power Tools for the Building Trades and Home Shop"
"Rockwell Delta Stationary Home Shop Power Tools"
"Rockwell Machine Tools"
"Rockwell Portable Power Tools for Industry, Construction, and the Building Trades"

Booklets and publications available free upon request from Stanley Tools, Division of the Stanley Works, New Britain, Connecticut:

No. 60 "Hand Tool Catalog"
No. 300 "Power Tool Catalog"
No. T2 "Joy of Accomplishment Folder"
No. T482 "Instruction Sheet: How to Check the Accuracy of a Level"
No. T13 "Boy's Booklet: How to Choose and Use Tools", "Router Bit Selector Chart"
No. T96 "Surform" Folder
No. T43 "Chisel" Folder
No. T122 "Hex-a-matic" Nut Driver
No. T199 "All-n-one" Tool
"Suggested List of Equipment for Junior or Senior High School"
"How to Use the Steel Square"

Pamphlets available from National Forest Products Association, 1619 Massachusetts Avenue, N.W., Washington, D. C. 20036:

"Manual for House Framing" – Wood Construction Data Booklet Number 1.
"Random Length Wood Decking" – Wood Construction Data Booklet Number 2.
"Design of Wood Formwork for Concrete Structures" – Wood Construction Data Booklet Number 3.
"Plank-and-Beam Framing for Residential Buildings" – Wood Construction Data Booklet Number 4.
"Heavy Timber Construction Details" – Wood Construction Data Booklet Number 5.
"Design of Wood Structures for Permanence" – Wood Construction Data Booklet Number 6.
"Insulation of Wood-Frame Structures" – Wood Construction Data Booklet Number 7.
"The Wood Tank" – Wood Construction Data Booklet Number 8.

Manual available from U. S. Expansion Bolt Company, York, Pennsylvania 17405.

FILMSTRIPS

The following filmstrips are available from the Industrial Education Department, Clemson University, Clemson, South Carolina 29631:

C-Kit 2 – Woodworking Tools and Machines

1. Hand Tools – Hammers – Saws – Selecting, carrying and arranging tools at the workbench – safe use of coping saws – handsaws – hammers.

2. Planes – Bits – Knives – Chisels – Screwdrivers – Files – Safe use of smooth, jack, and jointer planes – bits and drills – chisels, gauges and carving tools – knives – selecting and using screwdrivers – safe use of files and wood rasps.

3. Tool Grinder – Introduction to the tool grinder, kinds of tool grinders, names and functions of parts – safe practices for setting up a tool grinder – safe practices for using a tool grinder.

4. Drill Press – Introduction to the drill press, names and functions of parts – safe practices for setting up a drill press – safe practices for using a drill press.

5. Jig Saw – Introduction to the jig saw, names and functions of parts – safe practices for setting up a jig saw – safe practices for jig sawing.

6. Band Saw – Introduction to the band saw, names and functions of parts – safe practices for setting up a band saw – safe practices for band sawing.

7. Disk Sander – Introduction to the disk sander, kinds of disk sanders, names and functions of parts – safe practices for setting up a disk sander – safe practices for disk sanding.

8. Belt Sander – Introduction to the belt sander, names and functions of parts – changing a sander for horizontal operation – safe practices for setting up a belt sander, replacing an abrasive belt – safe practices for belt sanding.

9. Lathe: Parts, Spindle Turning – Introduction to the wood-turning lathe, kinds of wood-turning lathes, names and functions of parts – safe practices for setting up a lathe for spindle turning – safe practices for spindle turning.

10. Lathe: Faceplate Turning – Other Operations – Safe practices for setting up a lathe for faceplate turning – safe practices for faceplate turning – safe practices for sanding and polishing – safe practices for drilling.

11. Planer – Introduction to the planer, names and functions of parts, safe practices for setting up a planer – safe practices for using a planer.

12. Jointer – Introduction to the jointer, names and functions of parts, safe practices for setting up a jointer – safe practices for using a jointer.

13. Circular Saw: Parts – Installing a Blade – Introduction to the circular saw, kinds of circular saws, names and functions of parts – kinds of blades, installing a blade.

14. Circular Saw: Setting Up – Operating – Safe practices for setting up a circular saw – safe practices for using a circular saw.

C-Kit 3 – The Use of Machines in Our Industrial Life

1. The Evolution of Machines
2. Care and Use of the Band Saw
3. Care and Use of the Jig Saw
4. Care and Use of the Drill Press
5. Care and Use of the Shaper
6. Care and Use of the Circular Saw

C-Kit 4 – Woodworking Series – 4 strips

Shows correct usage and effective operation of hand and power tools in producing articles of wood.

Films formerly available from Clemson University are now available from State Department of Education, Audio-Visual Library, 1513 Gervais Street, Columbia, South Carolina 29201. Telephone 758-2687. A list of films currently available will be sent upon request.

5649

FREE FILMS

From Modern Talking Picture Service, 503 North College St., Charlotte, N. C. 28202:

Patterns of Time—The Hardwood Story, 13½ min. color. Produced by Fine Hardwoods Association and Hardwood Plywood Manufacturer's Assn. Film no. 2760.

From Modern Talking Picture Service, 714 Spring St., N.W., Atlanta, Georgia 30308:

Miracle in Wood, 27 min. color. Produced by American Plywood Association. Film no. 3159.

The Wood that Could, 28 min. color. Discusses applications for laminated timber beams. Produced by American Institute of Timber Construction.

From Audio-Visual Aids Library, 1513 Gervais Street, Columbia, S. C. 29201:

Interior and Exterior Trim. No. C-6, 12 minutes.
Fundamentals of Stair Layout. No. C-7, 11 minutes.

Note: Requests for use of films should be on school letterhead and contain the following information:

1. The title of the film.
2. The date or dates you prefer and alternate dates (order as far in advance as possible).
3. Your name and title.
4. Mailing address.

SAFETY IN TRADES AND INDUSTRIES
BUILDING CONSTRUCTION PROGRAMS

This section contains information needed to properly instruct students on how to work safely in the Building Construction trades. The accident rate in the trade runs higher than in most. Accidents often result in partial or total disability, sometimes death. Many less serious accidents, such as broken limbs, cuts and bruises are painful and can be expensive by causing the carpenter to be out of work for periods of time ranging from a few days to several months.

The important thing to remember is that costly accidents will not occur if workers are safety conscious and follow recommended safety precautions. The following information should be valuable in aiding students to develop the correct attitudes toward safety and acquaint them with certain safety precautions:

1. Dress sensibly for the job.

   a. Wear eye safety glasses as required by South Carolina law. Sun glasses should not substitute for safety glasses.

   b. Clothing should suit your individual needs and be suitable for the prevailing weather conditions. Avoid loose fitting clothing that would restrict freedom of movement.

   c. Students tend to work harder and safer if they are wearing clothes which they are not afraid to get dirty. Therefore, as students enter the shop each day they should immediately exchange their regular school clothing for coveralls or other accepted working attire. Time should be provided at the end of class for them to wash up and change back into their regular clothing.

   d. Avoid wearing pants or overalls that are too long. Cuffs made by turning up the legs of pants tend to catch heels and cause tripping and falls.

   e. To avoid catching on nails, keep the sleeves of shirts or jackets buttoned.

   f. Keep hair cut short or keep long hair in place with a visor or hair net.

   g. To protect feet from protruding nails, wear shoes with thick sturdy soles.

   h. To protect feet from falling objects, wear safety shoes or boots with steel toe caps.

   i. Wear a hard hat when exposed to overhead work where there is a chance of falling objects.

   j. Remove rings, wristwatches, neckties, neck chains and other jewelry.

2. Use caution in handling materials (approximately 25% of all injuries are a result of moving materials and tools improperly).

   a. Long pieces of material should be carried by two persons.

   b. Use the muscles in your legs and knees to lift heavy objects. Do not use your back muscles! To do so could result in painful back injuries.

   c. Observe caution when carrying planks or other objects across frozen, wet, or otherwise slippery footing.

3. Avoid falls.

   a. Learn to watch your footing, avoid objects that could trip you.

   b. Check scaffolding and temporary walkways before walking on them. Be sure the supports are strong and secure.

   c. Use only ladders which are in good condition and set up properly.

4. Practice good housekeeping.

   a. Materials and equipment should be stacked straight and neat.

   b. Keep aisles and walkways clear of tools, materials and debris.

   c. To prevent fires and reduce hazards which cause accidents, dispose of scraps and rubbish daily.

   d. Whenever you see protruding nails, remove them or bend them down immediately.

   e. When working above other workers, place tools and materials where they will not fall and cause injuries.

5. Properly use tools and equipment. (See pages 52-91 of appendix for specific safety precautions on individual machines.)

   a. Wear eye safety glasses as required by South Carolina law.

   b. Carry tools with sharp edges or points with the cutting edges and points down and away from you.

   c. Never carry awls, chisels and other tools with sharp points or edges in your pockets.

   d. Never use tools with mushroomed ends.

   e. Never use a tool with a loose head or broken handle.

   f. Never attempt to clean or adjust a power machine while it is in motion.

   g. Only the operator should be allowed to start or stop the machine and only the operator should be allowed in the operator's zone while it is in operation.

   h. Machines should not be operated while the instructor is away. Some means should be provided for disconnecting power to prevent machinery from being used while the instructor is gone.

   i. Keep tools sharpened and equipment in 100% working condition.

   j. All power tools should be grounded.

   k. Do not overload lifting equipment.

   l. All machines should be equipped with safety guards and devices.

6. Observe warnings posted at the construction site.

7. Consider the safety of fellow workers at all times.

8. The teacher should be prepared to administer first aid if the need arises (See section on first aid in Safety Handbook, A Guide for Trade and Industrial Education Programs). A well-supplied first aid kit should be kept in the shop or at the job site at all times.

9. Proper conduct is important in preventing unnecessary injuries.

   a. Avoid horseplay.

   b. Avoid running in the shop.

10. Keep your mind on the job. Many accidents occur when the worker is preoccupied with things other than the job at hand. Some causes of inattention could be:

    a. Financial worries.

    b. Daydreaming.

    c. Emotional conflicts.

    d. Distractions – chatting with fellow workers, watching passersby, listening to radio, etc.

    e. Illness.

    f. Some medications.

    g. Feeling of insecurity.

    h. Anger or frustration.

11. Safety equipment which should be in the shop:

    a. CO_2 type fire extinguisher

    b. Well-supplied first aid kit

    c. Approved eye protective devices for each student.

Pages 52-91 give specific safety precautions for each machine. Transparencies with the parts labeled are included. The following machines are covered in this section:

	Page
1. Radial Arm Saw	51
2. Table Saw	53
3. Band Saw	55
4. Jig Saw	57
5. Drill Press	59
6. Disk Sander	61
7. Belt Sander	63
8. Jointer	65
9. Planer	67
10. Portable Circular Saw	69
11. Portable Saber Saw	71
12. Portable Belt Sander	73
13. Portable Finishing Sander	75
14. Portable Router	77
15. Portable Electric Drill	79
16. Bench or Pedestal Grinder	81
17. Pneumatic Hammer	83
18. Shaper	85
19. Portable Planer	87
20. Wood Lathe	89

NOTE: This list is not to be interpreted as the suggested equipment for carpentry programs. Some equipment is listed because it is still in use in many carpentry shops and the writer feels that information should be included for the machines currently being used. Some equipment listed would not be recommended for use in carpentry programs.

5654

RADIAL ARM SAW

5655

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

1. RADIAL ARM SAW

The radial arm saw is used for ripping and crosscutting stock and for bevel, angle cuts and other specialized cuts used in woodworking shops.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the radial arm saw.
3. Never wear loose clothing when operating the radial arm saw.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Do not use the saw when other persons are talking to the operator.
7. Always use anti-kickback device when ripping. Feed only from side opposite anti-kickback.
8. Always use a push stick when ripping narrow pieces of stock.
9. When ripping stock, never place your fingers between the saw and the guide or fence.
10. Set the blade guard so that it just clears the stock being cut.
11. Be sure all levers are locked as required for the operation being performed before the power is turned on.
12. Never rip thin material or material less than 12" in length.
13. Never lower the saw blade so that it will cut into the table top.
14. Inspect all stock for knots, nails and other defects before cutting.
15. Keep hands well away from the blade and do not stand in line with the cut.
16. Hold stock firmly on the table and against the fence when crosscutting stock.
17. When shutting off radial arm saw, never leave until the blade has completely stopped. Never force material against the blade to stop it from turning.

TILTING ARBOR SAW

(TABLE SAW)

5657

B.C./2

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

2. TABLE SAW

The table saw is used for ripping, crosscutting and many other special operations in most woodworking classes.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the table saw.
3. Never wear loose fitting clothing when using the table saw.
4. Keep all guards and safety devices in good working condition and in place.
5. Make all adjustments with the power off.
6. Always use a push stick when ripping narrow stock.
7. Stand to one side and keep area directly behind and in front of the blade clear when the saw is in use.
8. Be sure blade is sharp and properly set. A dull blade will cause kickback.
9. Do not allow saw blade to project more than 1/8" to 1/4" above the stock being cut.
10. Never saw freehand; use the miter gauge or fence depending on cut being made.
11. Always place jointed or straight edge against fence.
12. Do not reach over the saw; use an assistant to help you with long stock.
13. Allow only the operator to feed stock through the saw.
14. Do not operate the saw when other persons in the area are talking to or otherwise disturbing the operator.
15. Keep work area clean and free of obstructions.
16. Always stop the saw and use a brush when cleaning sawdust from the table saw.
17. Remove the rip fence when crosscutting.
18. Never stop the saw blade by forcing a piece of wood against the side of the blade.
19. Provide a means of locking the switch in the off position when the saw is not in use.
20. Shut off machine and do not leave until the blade has completely stopped.

5658

BAND SAW

5659

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

3. BAND SAW

The band saw is most commonly used for straight and curved cuts in the shop.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the band saw.
3. Never wear loose fitting clothing when using the band saw.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Always use a push stick for close cutting work (keep hands out of the path of the blade).
7. Be sure that both the upper and lower wheel guards are securely closed before starting the band saw.
8. Check blade tension before starting the band saw.
9. Adjust upper blade guard and guide to allow for 1/8" - 1/4" clearance above the work piece.
10. Always check stock for knots, nails, and other defects before beginning your cut.
11. Do not place pressure against the blade or twist the blade by making too sharp a curved cut.
12. Always use a stick to remove blocks or chips near the saw blade.
13. Never back a saw blade out of the saw kerf while the saw is running.
14. Give your undivided attention to your work.
15. Shut off power and wait until saw blade stops before leaving the saw; use the brake if available.

JIG SAW

5661

B.C./4

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

4. JIG SAW

The jig saw is commonly used for cutting curved outlines; it may also be used for straight cuts where great accuracy is not required.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the jig saw.
3. Never wear loose fitting clothing when using the jig saw.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Always be sure the blade is properly installed with the teeth pointing down.
7. Check the machine by turning it over by hand to see that the blade tension is correct and that the blade clearance is proper.
8. Always keep the hold down adjusted to just clear the work piece so that it will not be raised off the table.
9. Always keep your fingers out of the direct path of the blade cut when feeding work into the jig saw.
10. Never force or crowd the work into the saw blade.
11. Never remove chips or small blocks from the saw table with your hands or fingers.
12. Shut off the power, and do not leave the jig saw until it has completely stopped.

5662

DRILL PRESS

5663

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

83 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

5. DRILL PRESS

The drill press is commonly used for boring holes in steel and wood. When working with wood it can also be used for mortising, routing, limited sanding and countersinking.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the drill press.
3. Never wear loose fitting clothing when using the drill press.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Always fasten work piece securely with the proper vise or clamp.
7. Always keep the long end of a work piece to your left if possible.
8. Support the end of a long work piece with a stand.
9. Always adjust the drill speed to suit the material being drilled and the size of the hole being bored.
10. Always remove the chuck key from the chuck after tightening a drill bit and before starting the motor.
11. Always feed the drill bit cautiously into the work piece.
12. Never attempt to stop a revolving work piece in which the drill bit is caught. Stop the drill press and then free the drill bit.
13. Always use cutting oil when drilling steel.
14. Always use sharp drill bits.
15. Always wait until the drill press stops before leaving the machine.

63

DISK SANDER

5665

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

6. DISK SANDER

The disk sander is commonly used to form and shape parts used in making woodworking projects.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the disk sander.
3. Never wear loose clothing when using the disk sander.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Always check to determine that the abrasive disk is properly mounted; never operate the disk sander if the abrasive paper is loose.
7. Always use the table, fence and other guides to control the position of the work whenever possible.
8. Always use hand-held clamps or a jig to hold small pieces for sanding.
9. Always sand on the side of the disk which is moving down toward the table; move the work along this surface so it will not burn.
10. Never use the sander to form or shape objects where other machines will do a better job.
11. Never sand work that has excess glue or finish on the surface.
12. Never force a piece of wood against the disk to stop it after the power has been shut off.
13. Always keep hands at least 2 inches from the sander disk.
14. Shut off power and wait until the disk stops completely before leaving the area.

BELT SANDER

566995

B.C./7

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

7. BELT SANDER

The belt sander is commonly used for sanding flat surfaces, edges, and, in some special cases, the inside curve of a work piece.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the belt sander.
3. Never wear loose fitting clothes when operating the belt sander.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Always be sure the belt is properly mounted; run the sander to make sure the belt tracks properly.
7. Always use the table fence and other guards to control the position of the work whenever possible.
8. Always use a hand clamp or jig to hold small and irregular shaped pieces.
9. Always keep the fingers, if possible, 2 inches away from the abrasive belt.
10. Always support the work against the table when sanding the end grain of narrow pieces.
11. Always use a pad or push block when sanding thin pieces.
12. Never use the sander to form or shape objects where other machines will do the job better.
13. Never sand work that has excess glue or finish on the surface.
14. Never force a piece of wood against the abrasive belt in order to slow it down.
15. Shut off the power, and do not leave the area until the belt sander has come to a complete stop.

JOINTER

5669

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

B.C

8. JOINTER

The jointer is commonly used in most shops where skills in woodworking are taught. A jointer is used for straightening, beveling, tapering and rabbeting the edges of lumber.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the jointer.
3. Never wear loose fitting clothing when using a jointer.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Check all stock for loose knots, nails or other defects before jointing.
7. Use a push stick or hold down block when jointing stock that is too small or short to give a reasonable distance of safety for your hands. Never joint lumber less than 10 inches long.
8. Lock fence in place before beginning jointing operations.
9. Keep hands away from the area immediately above the cutter head.
10. Always joint stock with the grain of the lumber to prevent splintering.
11. Never operate the jointer with fewer knives in the head than it is designed to use.
12. Always hold the edge or side of the stock being jointed tightly against the fence.
13. Shut off the power and do not leave the jointer until it has come to a complete stop.

5670

PLANER

5671

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

9. PLANER

The planer is generally used to smooth the rough face of lumber and/or to obtain a desired thickness of stock for a specific use.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the planer.
3. Never wear loose fitting clothing when operating a planer.
4. Keep all guards and safety devices in good working condition and in place.
5. Make all adjustments with the power off.
6. Check all stock for loose knots, nails and other defects before putting it through the planer.
7. Be sure blades are sharp and properly adjusted. Never operate the planer with fewer knives in the cutter head than it is designed to use.
8. Remove shavings only when the power is off, and use a brush for this purpose.
9. Always keep hands away from the material nearing the feed rolls.
10. Never plane stock which is shorter than 1 foot longer than the distance between the feed rolls or less than ¼" thick.
11. Never plane stock of different thicknesses; this can result in kickback.
12. Use gloves when rough stock is being planed.
13. Pass the stock around the planer and not over it when preparing to run it through the second time.
14. Never look directly into the feed roll area during the operation of the machine.
15. Do not overload the machine by taking too deep a cut.
16. When shutting down the planer, do not leave the machine until it has come to a complete stop.

PORTABLE CIRCULAR SAW

5673

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

10. PORTABLE CIRCULAR SAW

The portable circular saw is commonly used for framing and other rough construction work.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the portable circular saw.
3. Never wear loose fitting clothing when operating the portable circular saw.
4. Keep all guards and safety devices in good working order and in place.
5. Always check the power cord for condition, and be sure it is a 3-wire cord and is properly grounded.
6. Make all adjustments and check blade tightness with the power source disconnected.
7. Never stand on a wet surface when operating a portable circular saw.
8. Always be sure the switch is off before connecting to the power source.
9. Always use a sharp blade.
10. Always support the work piece securely with saw horses or other supports; clamp small pieces so they cannot slip or move.
11. Be careful not to cut into the saw horse, work bench or other support with the blade.
12. Always adjust the depth of cut to the thickness of the stock plus 1/8".
13. Always stand to one side of the cutting line during the cut.
14. Always be sure blade is not in contact with the work piece when starting the portable circular saw.
15. Always use both hands to hold and guide the saw through the work piece.
16. When shutting off, wait until the blade stops completely before placing the saw on the table.

PORTABLE SABER SAW

5675

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

11. PORTABLE SABER SAW

The saber saw is commonly used for cutting curves and other light work when a jig saw or band saw is not easily accessible or the work piece is too large for the jig or band saw.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the saber saw.
3. Never wear loose clothing when operating the saber saw.
4. Keep all guards and safety devices in good working order and in place.
5. Always check the power cord for condition and be sure it is a 3-wire cord and is properly grounded.
6. Make all adjustments with the power disconnected.
7. Never stand on a wet surface when operating a saber saw.
8. Always be sure the switch is off before connecting to the power source.
9. Always be certain you have the correct blade for the job to be done and the blade is securely fastened in the saw.
10. Always grip the saw firmly with both hands.
11. Always secure the work piece firmly with a vise or clamps as needed.
12. Always be careful not to cut into the bench or other support with the blade.
13. Always place the base of the saw firmly on the work piece before starting the cut.
14. Always start the motor before the blade contacts the work piece.
15. Always maintain a constant cutting pressure; excessive pressure can overload the motor and cause blade breakage.
16. Never make curved cuts so sharp as to jam, twist or otherwise foul the blade.
17. After the cut is completed, shut off the saw and wait until the blade stops completely before setting the saw down.
18. After completing the job, disconnect the saw from the power source and remove the blade.

5676

PORTABLE BELT SANDER

56677

Vocational Education Media Center, Clemson University and

12. PORTABLE BELT SANDER

The portable belt sander is commonly used in shops for sanding flat surfaces for both rough and semi-finish work.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the portable belt sander.
3. Never wear loose fitting clothing when operating the portable belt sander.
4. Keep all guards and safety devices in good working order and in place.
5. The portable belt sander cord should be a 3-wire cord and be properly grounded. Check grounding and condition of the cord before using the portable belt sander.
6. Make all adjustments with the power disconnected.
7. Never stand on a wet surface when operating the portable belt sander.
8. Always be sure the power switch is off before connecting to the power source.
9. Always check the mounting of the belt; run the portable belt sander to make sure the belt tracks properly.
10. Always grasp the portable belt sander firmly in both hands.
11. Never apply excessive pressure to the belt sander; this causes overheating of the motor and loading of the belt.
12. Always secure the work piece firmly so that it will not be thrown backward by the action of the belt.
13. Always wait until the belt stops moving completely before setting the portable belt sander down.

PORTABLE FINISHING SANDER

5679

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

13. PORTABLE FINISHING SANDER

Finishing sanders are commonly used to complete the final sanding where only a small amount of material needs to be removed. They may also be used for cutting down and rubbing finishing coats.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the finishing sander.
3. Never wear loose clothing when operating the finishing sander.
4. Keep all guards and other safety devices in good working order and in place.
5. Always check the power cord for condition and be sure it is a three wire cord and is properly grounded.
6. Make all adjustments with the power disconnected.
7. Never stand on a wet surface when operating a finishing sander.
8. Always be sure the switch on the finishing sander is off before connecting it to the power source.
9. Always be certain the power source is disconnected before replacing the abrasive pad.
10. Small work pieces must be fastened to the work area before being sanded.
11. Never apply excessive pressure beyond the weight of the sander itself; excessive pressure will cause overheating and reduced efficiency.
12. Always grip the sander firmly to maintain control of it.
13. Always start the sander before it is applied to the work piece.
14. Always remove the sander from the work piece before shutting it off.
15. Always disconnect the sander from the power source when the work is completed.

PORTABLE ROUTER

5681

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

14. PORTABLE ROUTER

The router is commonly used to cut irregular shapes and form various contours on the edges and surface of wood projects.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the router.
3. Never wear loose clothing when operating the router.
4. Keep all guards and safety devices in good working order and in place.
5. Always check the power cord for condition and be sure it is a 3-wire cord and is properly grounded.
6. Make all adjustments with the power source disconnected.
7. Never stand on a wet surface when operating a router.
8. Always be sure the switch on the router is off before connecting it to the power source.
9. Always disconnect the router from the power source when inserting bits. The bit must be securely inserted in the chuck at least ½" and the base must be tight.
10. Always be certain the work piece is securely fastened and/or clamped so it will not move.
11. Always place the router base on the work piece with the bit clear of the work before starting the router.
12. Always grip the router firmly with both hands.
13. Always feed the router smoothly through cut; don't force the router into the work and overload the motor.
14. When the cut is completed, shut off the motor and don't lift the router from the work piece until the bit has stopped rotating.
15. When the work is completed, disconnect the router from the power source and remove the bit.

PORTABLE ELECTRIC DRILL

568 3

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

PEDESTAL GRINDER

5685

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

16. BENCH OR PEDESTAL GRINDER

The bench or pedestal grinder is a tool commonly found in the shop. It is used to sharpen tools, smooth welds, shape tools and other jobs requiring the removal of metal.

SAFETY PRECAUTIONS

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the grinder.
3. Never wear loose clothing when using a grinder.
4. Keep all safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Do not use a grinder unless the plastic shield on the grinder is in place.
7. Keep the tool rest adjusted to within 1/8" of the stone at all times.
8. Always check stone for tightness and for cracks or flaws before using.
9. Keep the guard adjusted as near the wheel as possible.
10. Keep the grinding wheel true by frequent dressing.
11. Never use a grinding wheel after it has been worn to less than one half its original size.
12. Always use the face of the grinding wheel, not the sides, for grinding.
13. Always keep the hands and fingers away from the grinding wheel when it is in use.
14. Always use pliers, vise-grips or other suitable holding devices when grinding small, round or oddly shaped jobs.
15. Never force the job against the grinding wheel. Avoid overloading the grinder.
16. When starting a new wheel, stand back and allow it to run for a few minutes before using it for grinding.
17. Never apply the job to the grinder before it has reached running speed or while it is coasting to a stop.
18. Always keep work piece cool by frequent dipping in cold water.
19. Always stand to one side of the wheel when using the grinder.
20. When shutting off, wait until the grinder completely stops before leaving the area.

PNEUMATIC NAILER

5687

B.C./17

Courtesy Signode Corporation

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

17. AIR POWERED NAILER

The air powered nailer has taken much of the work out of nailing and has greatly increased the amount of work which can be performed by carpenters. Instead of being hammered into place, nails are fired into position by bursts of air. The nails used are similar to regular nails, and although they may be somewhat smaller, they are coated to increase their holding power.

SAFETY PRECAUTIONS

1. Wear approved eye protection.

2. Keep your mind on your work.

3. Know the operating procedures for the equipment before attempting to use it. Learn where the safety features are and how they work.

4. Use the correct type and size of nail for the job. Follow manufacturer's specifications.

5. Use no more air pressure than is recommended by the manufacturer. Normally, pressures should not exceed 90 pounds.

6. Before operating, check the machine to see that all safety features are working properly. Test fire the nailer into a block of wood for this purpose.

7. Never point the nailer in the direction of anyone, and always keep the nose pointed away from your body. Keep the nose pointed in the direction of the work.

8. When using, place the nose of the nailer firmly against the surface to be nailed.

9. Keep free hand away from the spot to be nailed.

10. Disconnect from the air supply when not in use.

SHAPER

B.C./18

Vocational Education Media Center, Clemson University and Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

Courtesy Rockwell Manufacturing Company

5689

18. SHAPER

The shaper is used by cabinet makers for making various contours and irregular shapes on edges of work. These shapes may be cut for the purpose of making joints or for adding a decorative effect. The shaper utilizes a high speed cutter past which the work is moved. The cutting head can be changed, and various types are available for cutting and making many different shapes.

SAFETY PRECAUTIONS

1. Wear approved eye protection.
2. Always feed stock into cutter.
3. Keep hands away from the cutter.
4. Be sure spindle nut is tight before starting motor.
5. Check all attachments and safety devices.
6. Have your instructor check all setups before starting the machine.
7. Use only new stock that is straight and is free of splits, checks and knots.
8. Make a trial cut on an extra piece of stock having the same thickness as the workpiece.
9. Keep a 4-inch margin of safety when utilizing the fence (or miter guage) and a 6-inch margin when using depth collars. For smaller parts, make a special holder or push board.
10. Only the operator should be in the operating zone and allowed to turn the machine on and off.

PORTABLE POWER PLANER

5691

B.C./19

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

Courtesy Rockwell Manufacturing Company

19. PORTABLE PLANER

The portable planer has almost replaced the hand plane for planing down the edges of doors and other work. In the power planer are high speed cutting knives which can be raised and lowered to cut the desired thickness.

SAFETY PRECAUTIONS

1. Wear approved eye safety glasses.
2. Remove tie, roll up sleeves and take off rings and wristwatch.
3. Be sure the workpiece is securely clamped and free of nails and obstructions.
4. Turn power off and disconnect plane from the power source before attempting to make adjustments.
5. To start cut, place front shoe on edge of work. Switch on motor and move along the work.
6. Keep your eyes on the work.
7. Do not overload the plane. Keep the cutting pressure even.
8. When the cut is finished, turn off the motor and be sure it has stopped before setting it down.
9. Disconnect plane from power source when not in use.

5692

WOOD LATHE

5693

Vocational Education Media Center, Clemson University and
Office of Voc. Educ., State Dept. of Educ., Columbia, S.C.

20. WOOD LATHE

Although the wood lathe is not regarded by all authorities as a machine which should be in the carpentry laboratory, many of them are still in use in such laboratories. In the lathe, a workpiece (usually a rectangular solid in shape) is rotated against a cutting tool and made into a cylinder. The cutting tools (called turning chisels) are manipulated by the operator to form the desired shape. Wood turning, as this operation is called, can be performed in two ways—by spindle turning (with the work mounted between centers), and faceplate turning (with the work mounted on a faceplate).

SAFETY PRECAUTIONS

A. For Spindle Turning (turning between centers)

1. Wear approved eye protection. Remove tie, roll up sleeves and remove watch and rings.
2. When selecting stock, avoid loose knots, checks, crossgrain, improperly glued stock, and splintery stock.
3. Center stock properly.
4. Lock tail stock in position and secure work firmly between centers.
5. Rotate stock by hand to determine clearance of tool rest. Clearance should be between 1/4 inch and 3/8 inch at all times.
6. Do rough turning at a slow speed.
7. Avoid heavy cuts.
8. Keep the turning chisel at proper angle and grip firmly.
9. From time to time, check the dead center for heating, lubrication and adjusting.
10. Keep tools sharp at all times.
11. Do not leave tools on bed of lathe while operating lathe.
12. Remove tool rest before sanding.
13. Only the operator should cut the machine on and off and be in the operator's zone.

B. For Faceplate Turning

1. Wear approved eye protection.
2. Remove tie, roll up sleeves and remove watch and rings.
3. Operate lathe at proper speed—the larger the stock, the lower the speed and the greater the need for accurate balancing.
4. Perform rough turning at a slow speed.

5. Keep tools sharp and properly shaped.

6. Avoid heavy cuts.

7. Care must be taken to avoid getting the chisel caught in work which could cause damage to work, tool, or operator.

8. Hold turning chisel firmly at the proper angle.

9. Keep tool rest at proper height and distance from work.

10. Remove tool before sanding.

11. Do not keep tools on bed of lathe while operating.

12. Screws holding the workpiece should be of a proper size, and screwed in straight, tight, and flush.

ACKNOWLEDGMENTS

Appreciation is expressed to all persons who assisted in the preparation of this publication.

Several agriculture teachers—Mr. W. W. Weldon, Florence Area Vocational Center; Mr. James A. Pooser, Southside High School; Mr. Wilson Lovett, Marion-Mullins Vocational Center; Mr. S. W. Stoudenmire, Latta High School; and Mr. I. A. Greene, Mayo High School—gave considerable assistance in preparing and writing content. Mr. F. E. Kirkley, Teacher Educator, Clemson University, gave considerable assistance in writing content and reviewing the manuscript. Miss Kate Salley, artist-illustrator, Vocational Education Media Center prepared most of the drawings and illustrations which appear in this publication. The final copy was prepared and edited by R. T. Benson, Agricultural Materials Specialist, Vocational Education Media Center.

Frank R. Stover
State Supervisor
Agricultural Education

INTRODUCTION

Safety is a part of our everyday life. We must consider safety in every activity in which we are engaged whether it be at home, in school, or anywhere else. Everyone must be conscious of safety so that possible accidents can be avoided. On the other hand, we must always be prepared to aid someone in the event an accident does occur.

This reference manual is prepared for you to use so that you can learn the safe way to work in the shop now and in your chosen occupation later. First aid is briefly discussed, so you can be prepared to assist yourselves and others in the event an accident does occur.

All sections of this manual should be studied so that you can prepare yourselves to be safe workers, and so you can assist others to become safe workers. Whenever you are not sure of a safety practice, refer to the safety reference manual, the operator's manual, and/or your instructor. Always remember it is best to spend a little more time and be safe than sorry.

Learning to work safely is one of the best lessons you can learn in school.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective clothing and equipment will not prevent accidents and injuries; but when properly used, such items may serve to lessen the resulting degree of damage or injury.

A. Eye Protection

The requirements for eye protection and the minimum quality standards of safety glasses are specified by the South Carolina Eye Protection Act. All areas requiring eye protection will be marked by signs, such as "Eye Protection Required Beyond This Point." Your instructor will inform you of the policy of your school on obtaining and using eye protective devices.

Eye protection equipment must be disinfected regularly. This may be accomplished by thorough cleaning with soap and warm water, or by a complete immersion in a "Lysol" solution. Storage cabinets which have ultra-violet lamps that come on when the cabinet doors are closed are used for the purpose of sanitizing safety glasses.

B. Head and Ear Protection

Although head and ear injuries are not very common in school shops, "hard" hats are highly recommended for projects such as building construction, where there is a possibility of being struck by a falling object.

C. Hand, Foot and Leg Protection

The majority of all disabling injuries occur to hands, legs and feet. Finger injuries are the most frequent.

1. Gloves and Hand Leathers. Canvas or heavy cotton work gloves should be worn to provide protection from blisters due to friction. Asbestos gloves should be used when heat is present. Leather gloves which extend well past the wrist are recommended for use in welding. Rubber gloves should be worn when handling acids, solvents and petroleum. When working around machinery, a decision must be made as to whether or not the use of gloves presents a greater hazard if caught in the machinery.

GOGGLE TYPE

SPECTACLE TYPE WITH SIDE SHIELDS

TWO TYPES OF EYE PROTECTIVE EQUIPMENT

2. Foot Protection. Safety shoes with steel toe inserts are used in industry to protect feet from heavy objects dropped or lowered on the feet. Metal inner soles protect feet from the hazards of protruding nails.

3. Leg Protection. Leggings provide protection against sparks, acid and metal splashes.

D. Respiratory Equipment

Filter respirators are available for protection against various types of dust, mists and fumes. Extreme care must be exercised when selecting filters, as a false sense of security can be generated by a filter not appropriate to the hazard present.

A filter may remove dusts and some fumes, but may not be capable of protecting the user from carbon monoxide or carbon tetrachloride fumes at all. (Carbon tetrachloride, formerly used as a cleaning agent and as a filler for fire extinguishers, should never be used for anything! Less toxic agents are available. Carbon tetrachloride is no longer recommended as a cleaning agent.)

E. Body Protection

Shop coats, aprons and coveralls should be used when appropriate in shops and labs. Aprons should be tied securely to prevent getting caught in machinery.

While working in the shop, the clothing you wear is very important in creating a safe atmosphere. Your clothing can very well mean the difference between your being able to work safely and comfortably and not being able to do so.

A student prepared to work safely and comfortably in the shop should:

1. Remove all rings, watches and other jewelry.
2. Roll up or fasten sleeves so they are not loose and flapping.
3. Remove or tuck his tie into his shirt.
4. Put on his safety glasses or other approved eye safety protection devices.
5. Depending on the job to be done, a properly fitted shop coat or coveralls may be worn. These should fit snugly so as not to catch in moving pieces of machinery.

AN INDIVIDUAL PROPERLY DRESSED

AN INDIVIDUAL IMPROPERLY DRESSED

DRESS FOR WORKING IN THE SHOP

COLOR CODING FOR SAFETY

The safety color codes developed by the American Standards Association for industrial use should be used in schools teaching agricultural mechanics. Standard color codes are as follows:

A. RED:

1. identifies Fire Protection equipment.
2. indicates Emergency Stops on equipment.

B. ALERT ORANGE:

designates hazards that might cut, crush or shock.
Examples: switch box interiors, gears and pulleys, cutting edges, presses and transmission cases.

C. HIGH VISIBILITY YELLOW:

1. indicates Caution.
2. designates hazards from stumbling, falling, tripping, bumping or collision.

Examples: aisles, handrails, barricades, protruding parts, stair approaches and floor areas near pits.

D. SAFETY GREEN:

identifies first aid and safety equipment.
Examples: first aid kits, stretchers and personal protective equipment storage.

E. PRECAUTION BLUE:

marks equipment controls as a reminder to use caution.
Example: electrical controls, valves, brakes and on signs indicating that equipment is not to be used.

F. BLACK AND WHITE:

indicates Housekeeping Areas.
Examples: locations of waste containers, stair risers and food dispensing equipment.

FIRE SAFETY AND FIRE EXTINGUISHERS

Knowledge of the classes of fires, and the correct types of extinguishers for a given class of fire is extremely important. Using an incorrect type of extinguisher may only create a greater hazard.

A. Classes of Fires

Class	Flammable Material	Type of Extinguisher To Be Used
A	Wood, Hay, Paper, Textiles	(1) Soda-acid (2) Water pump (3) Water from hose or bucket (4) Smother with blanket
B	Oil, Grease, Gasoline	(1) Pressurized dry chemical (2) Carbon dioxide (CO_2)
C	Live Electrical Equipment	(1) Carbon dioxide (CO_2) (2) Pressurized dry chemical

B. Characteristics of Fire Extinguishers

1. Soda-Acid (Figure 1)–One of the most common types. This extinguisher contains water, soda and a bottle of acid. When turned upside down, the acid mixes with the soda water and generates pressure for the stream. Use on Class A fires only. **Caution**–Once turned upside down, this extinguisher cannot be stopped until it is completely discharged. The solution may cause skin burns and is harmful to fabrics. This extinguisher should be pressure tested and recharged by qualified personnel once a year. Dangerous if used on electrical or oil fires.

2. Water Pump (Figure 2)– The water pump extinguisher is simply a tank with a hose and a hand-operated pump. Use on Class A fires only. Anyone can inspect this extinguisher for correct water level, pump operation and hose condition. Dangerous if used on electrical or oil fires.

3. Pressurized Dry Chemical (Figure 3)–The active ingredient in this extinguisher is ordinary baking soda and is not harmful to humans or fabrics. This type of extinguisher can be used intermittently, if necessary. Use on Class B or C fires only. A pressure gauge indicates the condition of the extinguisher. Use of this extinguisher leaves a residue of baking soda which, in some instances, may be difficult to remove. This extinguisher must be recharged by a qualified person.

4. Carbon Dioxide (CO_2) (Figure 4)–Use on Class B and C fires only. **Caution**–This extinguisher is only effective at close range. Released carbon dioxide gas (which puts out the fires) could injure a person because of the resulting low temperatures (far below 0°). A leaky valve may result in an extinguisher being empty when needed. An experienced serviceman must determine (by weighing) when the extinguisher needs a recharge. Refilling must be done by a qualified person.

5. Carbon Tetrachloride–Phosgene, a dangerous gas, results when the carbon tetrachloride strikes a hot surface.

The various types of extinguishers are recognizable by their shapes. Everyone should make a habit of knowing where fire extinguishers are located in the school or at work. Never allow a soda-acid or water type extinguisher to be placed in a shop area where there is a possibility of electrical or oil fires.

C. Fire Safety Precautions

1. If your clothing should catch on fire, don't panic. Smother the flames by wrapping in a blanket, a coat, or by rolling on the ground.

2. Flammable liquids, such as gasoline and paint thinner, should be kept in approved cabinets or storerooms.

3. Large quantities of flammable liquids should be stored in an area away from the main building.

4. Do not use highly flammable liquids for cleaning purposes.

5. Store flammable liquids only in approved safety containers.

6. Inspect all paint and chemical cabinets periodically for fire hazards.

7. Practice fire prevention in the school shop.

8. Fire extinguishers must be inspected regularly by qualified personnel.

9. Know and practice the proper procedure for evacuating the shop in case of fire or other emergency situations.

TYPES OF FIRE EXTINGUISHERS

TYPES OF EXTINGUISHERS CAN BE RECOGNIZED BY THEIR SHAPES.

FOR CLASS A FIRES (WOOD, HAY, PAPER AND TEXTILES)

1. SODA-ACID—

TO OPERATE:

AIM NOZZLE AT FIRE
TURN EXTINGUISHER UPSIDE DOWN

2. WATER PUMP

TO OPERATE:

AIM NOZZLE AT FIRE
OPERATE HAND PUMP

FOR CLASS B AND C FIRES

(OIL, GREASE, GASOLINE, PAINT, ELECTRICAL FIRES)

3. PRESSURIZED DRY CHEMICAL

TO OPERATE:

PULL SAFETY PIN
AIM EXTINGUISHER AT FIRE
SQUEEZE HANDLE

4. CARBON DIOXIDE (CO_2)

TO OPERATE:

PULL SAFETY PIN
AIM NOZZLE AT FIRE
SQUEEZE HANDLE

ELECTRICAL SAFETY

Electrical equipment is found in every vocational agriculture mechanics shop. Everyone should know the dangers present in electrical equipment and wiring and how to protect themselves and others from injury.

A. General Electrical Safety

1. Always install all electrical wiring in compliance with the National Electrical Code.
2. Never use temporary wiring. All extension cords for tools and appliances should be 3-wire parallel ground with grounding lug plugs.
3. Assume that all electrical equipment and wiring is "alive" and must be treated as such.
4. Remember the importance of safety interlocks and the dangers of by-passing electrical safety devices such as circuit breakers.
5. Never work on electrical equipment alone—always have someone else nearby.
6. While working on electrical equipment, stand on rubber mats or wooden floors.

B. Rescue from Electrical Shock

A person may receive an electric shock by touching a bare wire, an exposed socket or a faulty electrical tool or appliance. Shock hazards also exist inside various types of electronic equipment and around power lines. The possibility of shock is greatly increased if the person is also in contact with a grounded surface or if the floor or his body is wet.

1. If possible, shut off the current quickly.
2. If the current cannot be shut off promptly, attempt to move the victim away from the conductor, using some sort of insulated material.
3. Do not touch the victim until electrical contact is broken. Use a wooden pole, such as a broom handle, to separate the victim and the conductor. A large cloth such as a coat, may also be used.
4. A live conductor may cling to the victim, making it necessary to pull him (or the conductor) quite a distance away.
5. If the victim is not breathing after he has been removed from contact with the conductor, give him artificial respiration.

PROPER REMOVAL OF LIVE ELECTRICAL WIRE

LIFTING HEAVY WEIGHTS

Proper lifting is a skill. Attaining this skill could prevent sprains, back injuries and ruptures. Everyone is prone to demonstrate his strength, not realizing the safe limits of his muscle ability. Unwise muscular activity may cause an injury to your back that will be life long.

To lift an object, place feet eight to twelve inches apart. Keep the feet close to the object that is being lifted; this will keep the back muscles from having to lift all the load. Bend knees outward and keep the object close to the body.

To turn with the lifted object, shift the feet in the direction of travel. Never twist the body.

To place object on floor, reverse the lifting procedure; keep back straight, lower load by bending knees. Be sure supporting blocks are on floor so the fingers will not be mashed or pinched when an object is set down.

PROPER WAY TO LIFT

IMPROPER WAY TO LIFT

LIFTING HEAVY OBJECTS

FIRST AID

First aid is the immediate care given to an injured or sick person until the service of a physician can be obtained.

All students should know the fundamentals of first aid. Your shop should be equipped with a good general first aid kit containing bandages, gauze, cotton, tape, gauze pads, band-aids, eye pads, triangular bandages, tourniquet, ammonia, cotton buds, splints, measuring cups, scissors, tweezers, antiseptic cream and a first aid guide booklet.

The first aid program of the American National Red Cross provides for the training and certification of both instructors and students in first aid procedures. The Red Cross also publishes instructors' and students' handbooks.

A complete coverage of all first aid procedures is not possible in this brief publication. The following summary of recommended first aid procedures covers those situations most likely to be encountered in the agriculture mechanics shop.

A. Shock

Any serious injury may cause shock. Bad burns, loss of blood, cuts and broken bones are often followed by shock.

1. Signs of shock: The victim's skin feels cool and is whiter than usual. Perspiration may appear, especially on the forehead or chin or over the mouth. The victim may vomit.
2. First aid for shock: Always treat for shock when giving first aid. Shock may result in a loss of blood to the brain and may be more serious than the visible injury.
   a. Make the victim lie down so his head is level with, or lower than, the rest of his body.
   b. Cover the victim, placing a blanket beneath him and a coat or blanket over him. However, don't make him sweat.
   c. The patient may drink warm water if an hour or more will pass before the doctor arrives. Don't give water if the person is unconscious or has an injury in the stomach region. Stimulants, such as ammonia, have no value in shock.
   d. Don't disturb the patient unnecessarily. Try to avoid measures that would cause more pain. Don't feed him.

B. Wounds in which Bleeding is not Severe

Do not touch the wound or the skin near it with fingers, clothing or any other object. Do not breathe directly on the wound.

1. Apply a sterile gauze dressing.
2. Apply a bandage over the dressing.
3. Send the victim to a doctor.

Do not apply such things as lard, butter or oils to wounds. Do not put adhesive tape directly on a wound, and do not use cotton as a dressing.

C. First Aid for Serious Bleeding

Serious bleeding requires immediate first aid care for the victim. If someone is available to call the doctor, have him do so while you attempt to stop the bleeding. If there is no one available, attempt to stop the bleeding before you call the doctor. Locate a physician as soon as possible.

In most cases, bleeding can be stopped by applying pressure with a cloth wad placed directly on the wound. Bandage this wad tightly against the wound and do not remove it.

1. Keep the victim quiet.
2. Do not handle him roughly, transport him carelessly or talk to him unnecessarily.
3. Treat him for shock.
4. Do not give him any stimulants.
5. A bleeding limb should be raised slightly above the rest of the body by placing blankets or some other object under the limb.
6. For severe bleeding of the upper or lower extremities, the use of a tourniquet or finger pressure may be helpful.
7. Locate a physician.

D. Wounds that may Result in Tetanus (lockjaw)

Germs which cause tetanus are found around horses, on farms or where land has been fertilized with horse manure. Powder burns, such as those caused by fireworks, may also result in tetanus. Tetanus germs grow best in puncture wounds, such as those caused by nails, sharp sticks, splinters or other sharp objects. Even though the wound might not seem serious it should be treated by a physician, since a tetanus injection might be necessary.

First Aid Procedures:

1. Squeeze wound to encourage bleeding.
2. Apply dressing and bandage.
3. Get the patient to a doctor. A tetanus injection may be necessary.

E. Eye Injuries

Follow these procedures if a small object is on the eye surface:

1. Do not rub the eyes.
2. Do not attempt to remove the object with any sort of instrument.
   a. If you can gently pull the eyelid away from the eye and see the object under the lid, you may be able to remove it by touching it with a corner of a sterile cloth.
   b. If the foreign object has entered the eyeball, do not try to remove it. Place the injured person flat on a stretcher and get a doctor.
3. Send the injured person to the school nurse or to a doctor.

F. Artificial Respiration

The mouth-to-mouth (or mouth-to-nose) method is now believed to be the most practical method for emergency ventilation of a person who has stopped breathing when medical breathing equipment is not available. When a person stops breathing, artificial respiration should be started as soon as possible.

See the instructions for artificial respiration on the following page.

ARTIFICIAL RESPIRATION

MOUTH-TO-MOUTH (MOUTH-TO-NOSE) METHOD

(1) If there is foreign matter visible in the mouth, wipe it out quickly with your fingers or a cloth wrapped around your fingers.

Tilt the head back so the chin is pointing upward.

(2) ⬆ Pull or push ⬇ the jaw into a jutting-out position.

(3)

(4) Open your mouth wide and place it tightly over victim's mouth. At same time pinch victim's nostrils shut.

(5) Or close the nostrils with your cheek.

Or close the victim's mouth and place your mouth over the nose.

(6) Blow into the victim's mouth or nose. If you are not getting air exchange, recheck the head and jaw position (see drawings above at left).

(7) If you still do not get air exchange, quickly turn the victim on his side and administer several sharp blows between the shoulder blades in the hope of dislodging foreign matter.

Resume breathing procedure.

THE AMERICAN NATIONAL RED CROSS

HAND TOOL SAFETY

GENERAL RECOMMENDATIONS

A. Use the proper tool for the job to be done. Don't hammer with pliers; use the proper size and type hammer for the job. Don't pry with files or screwdrivers; use a pry bar. Use a wrench to tighten or loosen bolts; don't use pliers.

B. Use tools properly; select the size and type tool to fit the job. In doing this you will be able to do better work and to do it more safely.

C. Store tools in their proper and safe place. Put them in tool boxes, trays or hang them up when not in use. Tools improperly stored can cause injury and become damaged.

D. Only use tools that are in good condition. Tools with split handles, worn teeth, loose heads and dull or chipped edges do poor work and are more apt to cause injuries.

CHISELS, COLD

1. Always wear safety glasses.
2. Use the proper size and type chisel for the job to be performed.
3. Keep the cutting edge sharp.
4. Use a hammer of the proper type and size for the chisel being used—the larger the chisel, the heavier the hammer.
5. Hold the chisel properly. Use a fairly loose grip so that if the hammer misses, your hand will slip on the chisel and lessen the effect of the hammer blow on your hand.
6. Don't use a chisel which has become mushroomed on the end from hammer blows. Pieces may fly off and cause injury. Grind off the mushroomed end to a slight taper and flat across.

PROPER WAY TO HOLD CHISEL

PROPERLY SHAPED CHISEL

CHISEL NEEDING SHAPING

COLD CHISEL

CHISELS, WOOD

1. Always wear safety glasses.
2. Use proper size and type chisel for the job being performed.
3. Keep your chisels sharp and clean.
4. Never use a chisel as a pry bar or screwdriver.
5. Use the proper hammer for the type of chisel being used—a wooden mallet for a firmer chisel and a steel hammer for a framing chisel.
6. At all times protect the cutting edge when not in use.
7. Never drive a chisel too deep into the work—take lighter cuts.

WOOD CHISEL

PUNCHES

1. Always wear safety glasses.

2. Use the proper size and type of punch for the job being done.
   a. Use a starting punch to start a pin out.
   b. Use a pin punch to drive the pin out.

3. Use the correct type and size hammer for the punch being used.

4. Hold the punch properly, the same as you would hold a chisel.

5. Don't use a punch which has become mushroomed; dress the end of the punch the same as you would a cold chisel.

TWO TYPES OF PUNCHES

PROPER USE OF PUNCHES

PUNCHES

FILES

1. Always wear safety glasses.

2. Never use a file without a handle; the tang can cause a serious injury.

3. Files are very hard and brittle. Never use a file as a hammer or a pry. They may break and cause an injury.

4. Use only sufficient pressure to keep the file cutting. Excessive pressure can dull the file and possibly break it. Apply pressure only on the forward stroke.

5. Always clean the file with a file card when the teeth become clogged.

6. Store files where they will not bang together or hit other tools.

NEVER USE A FILE WITHOUT A HANDLE

FILES

HAMMERS

1. Always wear safety glasses.

2. Never use a hammer with a split or broken handle or a loose head. Be certain the head is tight and properly wedged, if necessary.

3. Always use the proper type and size hammer for the job to be done:
   a. a machine hammer for machine work
   b. a claw hammer for carpentry work
   c. a large hammer for heavy work
   d. a small hammer for light work.

4. Hold the hammer near the butt of the handle, and use a normal swing. Don't choke the hammer handle.

5. When using a hammer on a metal surface, never strike a surface harder than the face of the hammer.

6. Don't use the butt of a hammer handle to drive or bump anything.

7. Never use a hammer handle to pry.

CLAW HAMMER

BALL PEEN HAMMER

PROPER WAY TO HOLD A HAMMER

HAMMERS

SAWS

1. Always wear safety glasses.

2. Always use the proper type and size saw for the job to be done:
   a. a hack saw to cut metal
   b. a rip saw to saw wood along the grain
   c. a crosscut saw to saw wood across the grain.

3. Always use a sharp saw that has the proper set.

4. Don't force a saw when cutting.

5. When starting a saw cut, use your thumb on the side of the saw above the teeth to guide the blade. Always pull the saw up or toward yourself when starting a cut; if you push the saw, it can jump and cause you to cut yourself. It may also start the cut somewhere other than where you want.

6. Saws kept rust-free and sharp are less likely to jump or bind in the saw kerf. Keep handles tight.

7. Saws should always be hung up when not in use to protect the saw and to prevent injuries.

BACK SAW

KEYHOLE SAW

COPING SAW

HACKSAW

HANDSAW

SAWS

SCREWDRIVERS

1. Always wear safety glasses.

2. Use the correct type and size screwdriver for the job to be done.

3. Never hammer on a screwdriver handle—this will split the handle and can cause injury. A screwdriver may be tapped to drive the rust from a screw slot.

4. Never use a screwdriver:
   a. to pry.
   b. as a cold chisel.
   c. to check electrical circuits.

5. Keep screwdriver bits properly shaped.

6. Never use a pair of pliers or wrench or other tool to turn a screwdriver.

7. Keep screwdriver shank vertical with the screw head.

SCREWDRIVERS

WRENCHES

1. Always wear safety glasses.

2. Use the proper type and size wrench for the job to be done.

3. The jaws of the wrench, especially an adjustable wrench, should fit the nut or bolt head snugly.

4. Whenever possible pull on the wrench. To push on a wrench can cause cut, bruised or broken knuckles.

5. Be sure the pressure is applied to the fixed jaw of an adjustable wrench. Use adjustable wrenches only when no other type of wrench will work.

6. Never attempt to put a wrench on moving machinery. Never leave a wrench on machinery after completing your work—it can fly off and cause injury.

ADJUSTABLE WRENCH

THE PROPER WAY TO USE A WRENCH

HAND PLANES

1. Always wear safety glasses.
2. Be sure to use the proper size and type of hand plane for the job to be done.
3. Always keep the plane irons sharp and in good condition.
4. Clean chips and other waste materials from around the plane iron with a brush or stick; never use the fingers.
5. Lay the plane on the bench on its side to prevent damaging the cutting edge.
6. When putting the plane away, be sure the plane iron is protected from damage and place it so the iron will not cause injury to anyone.
7. Be certain the plane iron is properly adjusted before use.

JACK

FORE

SMOOTH

BLOCK

HAND PLANES

POWER TOOL SAFETY

JOINTER

The jointer is commonly used in most shops where skills in woodworking are taught. A jointer is used for straightening, beveling, tapering and rabbeting the edges of lumber.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the jointer.
3. Never wear loose fitting clothing when using a jointer.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Check all stock for loose knots, nails or other defects before jointing.
7. Use a push stick or hold down block when jointing stock that is too small or short to give a reasonable distance of safety for your hands.
8. Lock fence in place before beginning jointing operations.
9. Keep hands away from the area immediately above the cutter head.
10. Always joint stock with the grain of the lumber to prevent splintering.
11. Never operate the jointer with fewer knives in the head than it is designed to use.
12. Hold the edge or side of the stock being jointed tightly against the fence.
13. Shut off the power, and do not leave the jointer until it has come to a complete stop.

PLANER

The planer is generally used to smooth the rough face of lumber and/or to obtain a desired thickness of stock for a specific use.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the planer.
3. Never wear loose fitting clothing when operating a planer.
4. Keep all guards and safety devices in good working condition and in place.
5. Make all adjustments with the power off.
6. Check all stock for loose knots, nails and other defects before putting it through the planer.
7. Be sure blades are sharp and properly adjusted. Never operate the planer with fewer knives in the cutter head than it is designed to use.
8. Remove shavings only when the power is off, and use a brush for this purpose.
9. Always keep hands away from the material nearing the feed rolls.
10. Never plane stock which is shorter than 2 feet longer than the distance between the feed rolls or less than 1/4" thick.
11. Never plane stock of different thicknesses; this can result in kickback.
12. Use gloves when rough stock is being planed.
13. Pass the stock around the planer and not over it when preparing to run it through the second time.
14. Never look directly into the feed roll area during the operation of the machine.
15. Do not overload the machine by taking too deep a cut.
16. When shutting down the planer, do not leave the machine until it has come to a complete stop.

TILTING ARBOR SAW

(TABLE SAW)

The table saw is used for ripping, cross-cutting and many other special operations in most woodworking classes.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the table saw.
3. Never wear loose fitting clothing when using the table saw.
4. Keep all guards and safety devices in good working condition and in place.
5. Make all adjustments with the power off.
6. Always use a push stick when ripping narrow stock.
7. Stand to one side, and keep area directly behind and in front of the blade clear when the saw is in use.
8. Be sure blade is sharp and properly set. A dull blade will cause kickback.
9. Do not allow saw blade to project more than 1/8" to 1/4" above the stock being cut.
10. Never saw freehand; use the miter gauge or fence depending on cut being made.
11. Always place jointed or straight edge against fence.
12. Do not allow your hand to pass the front edge of the saw table.
13. Do not reach over the saw; use an assistant to help you with long stock.
14. Allow only the operator to feed stock through the saw.
15. Do not operate the saw when other persons in the area are talking or otherwise disturbing the operator.
16. Keep work area clean and free of obstructions.
17. Always stop the saw and use a brush when cleaning sawdust from the table saw.

18. Remove the rip fence when crosscutting.

19. Never stop the saw blade by forcing a piece of wood against the side of the blade.

20. Provide a means of locking the switch in the "off" position when the saw is not in use.

21. Shut off machine and do not leave until the blade has completely stopped.

RADIAL ARM SAW

The radial arm saw is used for ripping and crosscutting stock and for bevel, angle cuts and other specialized cuts used in woodworking shops.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the radial arm saw.
3. Never wear loose clothing when operating the radial arm saw.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Do not use the saw when other persons are talking to the operator.
7. Always use the anti-kickback device when ripping. Feed stock only from the side opposite the anti-kickback device.
8. Always use a push stick when ripping narrow pieces of stock.
9. When ripping stock, never place your fingers between the saw and the guide or fence.
10. Set the blade guard so that it just clears the stock being cut.
11. Be sure all levers are locked as required for the operation being performed before the power is turned on.
12. Never rip thin material or material less than 12" in length.
13. Never lower the saw blade so that it will cut into the table top.
14. Inspect all stock for knots, nails and other defects before cutting.
15. Keep hands well away from the blade, and do not stand in line with the cut.
16. Hold stock firmly on the table and against the fence when crosscutting stock.
17. Never force material against the blade to stop it.
18. When shutting off radial arm saw, never leave until the blade has completely stopped.

BAND SAW

The band saw is most commonly used for curved or circular cuts and straight cuts where great accuracy is not required.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the band saw.
3. Never wear loose fitting clothing when using the band saw.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Check stock for knots, nails and other defects before beginning your cut.
7. Always use a push stick for close cutting work. Keep hands out of the path of the blade.
8. Be sure that both the upper and lower wheel guards are securely closed before starting the band saw.
9. Check blade tension before starting the band saw.
10. Adjust upper blade guard and guide to allow for 1/8" - 1/4" clearance above the work piece.
11. Do not place pressure against the blade or twist the blade by making too sharp a curved cut.
12. Always use a stick to remove blocks or chips near the saw blade.
13. Never back a saw blade out of the saw kerf while the saw is running.
14. Shut off power and wait until saw blade stops before leaving the saw; use the brake, if available.
15. Give your undivided attention to your work.

JIG SAW

The jig saw is commonly used for cutting curved outlines. It may also be used for straight cuts where great accuracy is not required.

Safety Precautions

1. Wear safety glasses.

2. Obtain your instructor's permission to use the jig saw.

3. Never wear loose fitting clothing when using the jig saw.

4. Keep all guards and safety devices in good working order and in place.

5. Make all adjustments with the power off.

6. Always be sure the blade is properly installed with the teeth pointing down.

7. Check the machine by turning it over by hand to see that the blade tension is correct and that the blade clearance is proper.

8. Always keep the hold down adjusted to just clear the work piece so that the work will not be raised off the table.

9. Always keep your fingers out of the direct path of the blade cut when feeding work into the jig saw.

10. Never force or crowd the work into the saw blade.

11. Never remove chips or small blocks from the saw table with your hands or fingers.

12. Shut off the power, and do not leave the jig saw until it has completely stopped.

DRILL PRESS

The drill press is commonly used for boring holes in steel and wood. When working with wood, it can also be used for mortising, routing, limited sanding and countersinking.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the drill press.
3. Never wear loose fitting clothing when using the drill press.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Fasten work piece securely with the proper vise or clamp.
7. Always keep the long end of a work piece to your left, if possible, when drilling.
8. Support the end of a long work piece with a stand.
9. Adjust the drill speed to suit the material being drilled and the size of the hole being bored.
10. Always remove the chuck key from the chuck after tightening a drill bit and before starting the motor.
11. Always feed the drill bit cautiously into the work piece.
12. Never attempt to stop a revolving work piece in which the drill bit is caught. Stop the drill press and then free the drill bit.
13. Always use cutting oil when drilling steel.
14. Be certain that the drill bits are sharp before using.
15. Always wait until the drill press stops before leaving the machine.
16. Be sure to remove the drill bit from the chuck when the job is completed.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

DISK SANDER

The disk sander is commonly used to form and shape parts used in making woodworking projects.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the disk sander.
3. Never wear loose clothing when using the disk sander.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Check to determine that the abrasive disk is properly mounted. Never operate the disk sander if the abrasive paper is loose.
7. Use the table, fence and other guides to control the position of the work, whenever possible.
8. Always use hand-held clamps or a jig to hold small pieces for sanding.
9. Always sand on the side of the disk which is moving down toward the table. Move the work along this surface so it will not burn.
10. Never use the sander to form or shape objects where other machines will do a better job.
11. Never sand work that has excess glue or finish on the surface.
12. Never force a piece of wood against the sanding disk to stop it after the power has been shut off.
13. Always keep hands at least 2 inches from the sander disk.
14. Shut off power and wait until the sanding disk stops completely before leaving the area.

BELT SANDER

The belt sander is commonly used for sanding flat surfaces, edges and in some special cases, the inside curve of a work piece.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the belt sander.
3. Never wear loose fitting clothing when operating the belt sander.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Run the sander to make sure the belt tracks properly. Always be sure the belt is properly mounted.
7. Always use the table, fence and other guards to control the position of the work, whenever possible.
8. Be sure to use a hand clamp or jig to hold small and irregular shaped pieces.
9. Keep your fingers, if possible, 2 inches away from the abrasive belt.
10. Always support the work against the table when sanding the end grain of narrow pieces.
11. Always use a pad or push block when sanding thin pieces.
12. Never use the sander to form or shape objects where other machines will do the job better.
13. Never sand work that has excess glue or finish on the surface.
14. Never force a piece of wood against the abrasive belt in order to slow it down.
15. Shut off the power, and do not leave the area until the belt sander has come to a complete stop.

WOOD LATHE

The wood lathe is commonly used in the shop for making cylindrical objects of many shapes to be used in shop projects.

Safety Precautions

1. Always wear safety glasses.

2. Obtain your instructor's permission to use the wood lathe.

3. Never wear loose clothing when using the wood lathe.

4. Keep all safety devices in good working order and in place.

5. Make all adjustments with the power off.

6. Check the stock to be sure it contains no loose knots, insecurely glued joints or checkered ends.

7. Always check stock to make sure it is securely mounted, centers properly imbedded and tail stock firmly clamped in place. Spin the set-up by hand before starting the lathe.

8. Keep the tool rest adjusted close to the stock and slightly above center.

9. Remove the tool rest when it is not in use, such as during sanding or polishing operations.

10. Always stop the lathe to make any and all measurements.

11. Never allow excess chips to gather on the floor, as they present fire and slipping hazards.

12. Always keep your lathe tools sharp.

13. Replace lathe tools in the cabinet when not in use.

14. Always hold the lathe tool in both hands.

15. Stand slightly to one side of the cut being made; and hold the chisel so that, if thrust back suddenly, it will not strike the body.

16. Always have observers stand either in front or at the ends of the lathe and otherwise out of any danger area.

17. Be sure to use the proper tool for the type of cut to be made.

18. When shutting off the lathe, wait until it stops completely before leaving the area.

HORIZONTIAL BAND SAW

POWER HACKSAW

The power hacksaw is used to cut metals which are softer than the hacksaw blade. Power hacksaws can be of two types: the reciprocating hacksaw and the band hacksaw. The uses are similar, and in most cases the safety precautions will be the same.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the power hacksaw.
3. Never wear loose fitting clothing when using a power hacksaw.
4. Keep all guards and safety devices in good working order and in place.
5. Make all adjustments with the power off.
6. Be sure to get help when cutting heavy materials.
7. Keep floor clear of grease, oil and short pieces of metal at all times.
8. Never clean chips from the saw while it is running.
9. Never clean chips from the machine with the hands—use a brush.
10. Handle cut pieces carefully, because they contain burrs which can cause serious cuts until the burrs can be removed.
11. To prevent tooth breakage, the blade should be in motion before it comes in contact with the stock.
12. Never put excessive tension on the blade; too much tension could shatter the blade, causing particles of flying steel.
13. When shutting off the hacksaw, wait until the blade stops completely before leaving the area.

PEDESTAL GRINDER

The bench or pedestal grinder is a tool commonly found in the shop; it is used to sharpen tools, smooth welds, shape tools and other jobs requiring the removal of small amounts of metal.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the grinder.
3. Never wear loose clothing when using a grinder.
4. Keep all safety devices and guards in good working order and in place.
5. Make all adjustments with the power off.
6. Do not use a grinder unless the plastic shield on the grinder is in place.
7. Keep the tool rest adjusted to within 1/8" of the stone at all times.
8. Always check stone for tightness and for cracks or flaws before using.
9. Keep the guard adjusted as near the wheel as possible
10. Keep the grinding wheel true by frequent dressing.
11. Never use grinding wheels which have been greatly worn down by use. Never use a wheel after it has been worn to less than one half its original size.
12. Use the face of the grinding wheel, not the sides, for grinding.
13. Never allow the hands and fingers to contact the grinding wheel when it is in motion.
14. Always use pliers, vise-grips or other suitable holding devices when grinding small, round or oddly shaped workpieces.
15. Never force the job against the grinding wheel, and avoid overloading the grinder.
16. When starting a new wheel, stand back and allow it to run for a few minutes before using it for grinding.

17. Never apply the job to the grinder before it has reached running speed or while it is coasting to a stop.

18. Be sure to keep work piece cool by frequent dipping in cold water.

19. Always stand to one side of the wheel when using the grinder.

20. When shutting off, wait until the grinder completely stops before leaving the area.

ENGINE LATHE

The engine lathe is used in the shop for turning down metal cylinders and to prepare special replacements not available in the area. It can also be used to make parts when machinery is being modified for special purposes.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the engine lathe.
3. Never wear loose clothing when using the engine lathe.
4. Keep all safety devices and guards in good working order and in place.
5. Make all adjustments with the power off.
6. Clamp all work solidly; use the correct tool and work holding device for the job.
7. Keep tools not in use in cabinets and out of the immediate work area. Never place tools on the lathe ways.
8. Be sure to turn the face plate or chuck on by hand.
9. Always turn the set-up-job by hand to be sure clearances are correct before turning on the power.
10. Always stop the machine to make measurements.
11. Always allow the lathe to stop by itself; never attempt to use your hand to help slow it down.
12. Support all work solidly.
13. Always use the hand feed to make all finish cuts near the face plate, chuck or shoulder.
14. Always remove the key from the chuck before starting the lathe.
15. Never use a file without a handle.
16. Never use your hands to remove chips or shavings from the lathe—use a cleaning brush. Stop the lathe before cleaning.
17. Always keep the floor area around the lathe clean and free of oil and metal chips and shavings.

18. When shutting down the lathe, wait until it has completely stopped before leaving the area.

OXYACETYLENE WELDER

Oxyacetylene welding equipment is commonly used in shops to fuse weld, braze weld, cut steel and provide heat when required for shaping metals.

Safety Precautions

1. Obtain your instructor's permission to use the oxyacetylene welder.

2. Wear gloves and nongreasy clothing without cuffs.

3. Always wear approved welding goggles with a shade 4 or darker colobar lens. Wear safety glasses when welding goggles are not being used—for example, when grinding.

4. Never use oil of any kind on any part of the oxyacetylene welding equipment.

5. Check all connections and hoses daily for leaks. A soap solution works well for this.

6. Use the proper hoses with standard fittings, usually a braded double hose, green for oxygen and red for acetylene.

7. Keep hot metal and flame away from the hose.

8. Never light the torch near flammable material.

9. Always keep the welding tip pointed down and away from yourself to prevent saturating your clothes with gas before lighting.

10. Never open the acetylene tank valve over one full turn so that it can be shut off quickly in case of an emergency.

11. Never drop or subject the gas tanks to rough handling.

12. Be sure to shut off both tanks and bleed lines and gauges when you have finished welding.

13. Never lay a lighted torch down.

14. Always place hot metal in a designated place or scrap barrel to prevent burns.

15. Never put more pressure on the hoses than is required to properly operate the tip being used.

16. Keep the safety caps on tanks not in use, and store unused tanks upright and in an area where flame or excessive heat cannot reach them.

17. Be sure there is adequate ventilation in the welding area. Provide additional ventilation when working on galvanized metals.

18. Always use a flint lighter when lighting the torch.

ELECTRIC ARC WELDER

The electric arc welder with its accessories is commonly used in the shop for fusion welding, braze welding, cutting and heating of metals.

Safety Precautions

1. Obtain your instructor's permission to use the electric arc welding equipment.

2. Wear gloves and clothing without cuffs, which cover and protect the entire body, including arms and legs. High top shoes are recommended to prevent slag and sparks from falling onto and burning your feet. A skull cap will protect the head and hair from sparks and slag.

3. Wear a welding helmet with the proper shade lens for the welding job being done.

4. Always make sure the welder is properly grounded before starting it.

5. Check the electrode holder, welding cables and other connections to be certain they are properly insulated.

6. Never weld in an area which is damp or where you are standing in water.

7. Always wear safety glasses or a lift front head shield when chipping or cleaning welds.

8. Never strike an arc until you are sure that all persons in the area are protected from the arc rays.

9. Never look at an arc without a head shield with the proper shade lens in it.

10. Always place electrode stubs in a container when discarding them. If they are thrown on the floor they present a dangerous hazard.

11. Check the area around where you are welding for flammable materials.

12. Be sure to keep the shop well ventilated.

13. Always see your instructor for treatment if you have experienced an arc flash, regardless of how minor you may think it is.

14. Do not allow the welding cable to come in contact with hot metal or sharp edges.

15. Never cool the electrode holder in water.

16. Place all hot metal in the designated area.

17. Always use forced ventilation when working with galvanized iron.

HYDRAULIC ARBOR PRESS

The hydraulic arbor press is commonly used in the shop to shape metals, test welds and to remove or replace bearings, gears and other tight fitting collars on shafts.

Safety Precautions

1. Always wear safety glasses.

2. Obtain your instructor's permission to use the hydraulic arbor press.

3. Never wear loose clothing when operating the hydraulic arbor press.

4. Keep all safety devices in good working order and in place.

5. Make all adjustments before pressure is applied to the work piece.

6. Never attempt to move or hold the work piece after pressure is applied.

7. Be sure no other person is standing in an area where he may be hit by flying metal.

8. Always stand behind the end of the hydraulic arbor press and never in front of the work area, to avoid being hit by flying metals.

9. Be very cautious when pressing strong springs or springy material.

10. When applying pressure to the work piece, stop periodically to inspect the work to be sure everything is all right.

11. Never leave the hydraulic press when you are applying pressure to a work piece. Always relieve the pressure before leaving the work area.

12. Always use sufficient supports, clamps or other devices to adequately hold and support the job being done.

HYDRAULIC JACK

The hydraulic jack is used in shops for many purposes, such as lifting heavy objects, positioning heavy parts and supporting heavy objects.

Safety Precautions

1. Always wear safety glasses.

2. Obtain your instructor's permission to use the jack.

3. Never wear loose clothing when using a jack.

4. Keep all safety devices in good working order and in place.

5. Make all adjustments before applying pressure to the job.

6. Always use a jack capable of supporting the load to be lifted or moved.

7. Use extra footing supports under the jacks where needed.

8. Always check jacks to be sure that neither the jack nor the load will be damaged.

9. When it is necessary to work under the object being held by the jack, always place additional supports under the object, such as supporting blocks or jack stands. Never work under an object supported only by a jack.

10. Never leave an object supported only by a jack; place other supports under it, and identify the object so that others will not be hurt and so that someone else will not try to remove the jack.

CHAIN HOIST

MANUAL

ELECTRIC

The chain hoist is commonly used in the shop for raising heavy objects, shaping metals and pulling bent pieces of equipment into place. It is also used for moving heavy objects and for raising objects higher than jacking allows.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the chain hoist.
3. Never wear loose clothing when using a chain hoist.
4. Keep all safety devices in good working order and in place.
5. Make adjustments and check all connections before raising an object.
6. Never lift an object of greater weight than the capacity of the chain hoist.
7. Be sure the supporting frame or beam is of sufficient capacity to handle the load being raised.
8. Never get under the object being raised.
9. Always use chains, cables or other devices of sufficient capacity to hold the object.
10. Never lift the object higher than is needed to properly perform the job.
11. Always check the chains, cables or other lifting devices as soon as they are carrying the load and before raising the object to the desired height.
12. Never leave a load suspended on the hoist when you must leave the area.

STEAM CLEANER

The steam cleaner is commonly used in shops for the purposes of complete cleaning of equipment, for repairs and/or painting and to clean parts for reassembly.

Safety Precautions

1. Always wear safety glasses.

2. Obtain your instructor's permission to use the steam cleaner.

3. Never wear loose clothing when using the steam cleaner.

4. Keep all safety devices in good working order and in place.

5. Make all adjustments with the power off and the burner cool.

6. Always check to be sure there is sufficient water flowing through the steam cleaner before lighting the burner.

7. Always check the electrical connections to be sure they are tight and to be certain they will not become wet or lie in water, as this can cause short circuits and possible serious injury.

8. Always hold the steam cleaner hose by the insulated hand grip, and wear gloves to prevent burns to the hands.

9. Never point the steam cleaner toward other persons.

10. Check the work area to be sure there are no persons in a location where they will be accidentally sprayed.

11. Be sure the safety blow-out plug is pointed toward the floor.

12. Keep a constant check to be sure there is sufficient water in-flow to the steam cleaner to insure safe and proper operation.

13. Never operate the steam cleaner unless water droplets are emitted with the steam.

14. When shutting off the steam cleaner, turn off the burner first and leave water pump running until clear cool water flows from the steam hose, then turn off water. Never leave the steam cleaner until it has been completely shut down.

PORTABLE CIRCULAR SAW

The portable circular saw is commonly used for framing and other rough construction work.

Safety Precautions

1. Always wear safety glasses.

2. Obtain your instructor's permission to use the portable circular saw.

3. Never wear loose fitting clothing when operating the portable circular saw.

4. Keep all guards and safety devices in good working order and in place.

5. Always check the power cord for condition, and be sure the power cord is 3-wire and is properly grounded.

6. Make all adjustments and check blade tightness with the power source disconnected.

7. Never stand on a wet surface when operating a portable circular saw.

8. Always be sure the switch is off before connecting the portable circular saw to the power source.

9. Always use a sharp blade.

10. Support the work piece securely with saw horses or other supports. Clamp small pieces so they cannot slip or move.

11. Be careful not to cut into the saw horse, work bench or other support with the blade.

12. Adjust the depth of cut to the thickness of the stock plus 1/8".

13. Always stand to one side of the cutting line during the cut.

14. Be sure blade is not in contact with the work piece when starting the portable circular saw.

15. Always use both hands to hold and guide the saw through the work piece.

16. When shutting off, wait until the blade stops completely before placing the saw on the table.

PORTABLE SABER SAW

The saber saw is commonly used for cutting curves and other light work when a jig saw or band saw is not easily accessible or the work piece is too large for the jig or band saw.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the saber saw.
3. Never wear loose clothing when operating the saber saw.
4. Keep all guards and safety devices in good working order and in place.
5. Always check the power cord for condition, and be sure the power cord is 3-wire and is properly grounded.
6. Make all adjustments with the power disconnected.
7. Never stand on a wet surface when operating a saber saw.
8. Always be sure the switch is off before connecting the saber saw to the power source.
9. Always be certain you have the correct blade for the job to be done and that the blade is securely fastened in the saw.
10. Grip the saw firmly with both hands.
11. Always secure the work piece firmly with a vise or clamps as needed.
12. Be careful not to cut into the bench or other support with the blade.
13. Always place the base of the saw firmly on the work piece before starting the cut.
14. Start the motor before the blade contacts the work piece.
15. Always maintain a constant cutting pressure. Excessive pressure can overload the motor and cause blade breakage.
16. After the cut is completed, shut off the saw and wait until the blade stops completely before setting the saw down.

17. After completing the job, disconnect the saw from the power source and remove the blade.

18. Never make curved cuts so sharp as to jam, twist or otherwise foul the blade.

PORTABLE FINISHING SANDER

Finishing sanders are commonly used to complete the final sanding where only a small amount of material needs to be removed. They may also be used for cutting down and rubbing finished coats.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the finishing sander.
3. Never wear loose clothing when operating the finishing sander.
4. Keep all guards and other safety devices in good working order and in place.
5. Always check the power cord for condition, and be sure the power cord is 3-wire and is properly grounded.
6. Make all adjustments with the power disconnected.
7. Never stand on a wet surface when operating a finishing sander.
8. Always be sure the switch on the finishing sander is off before connecting it to the power source.
9. Always be certain the power source is disconnected before replacing the abrasive pad.
10. Small work pieces must be fastened to the work area before being sanded.
11. Never apply excessive pressure beyond the weight of the sander itself. Excessive pressure will cause overheating and reduced efficiency.
12. Grip the sander firmly to maintain control of it.
13. Start the sander before it is applied to the work piece.
14. Remove the sander from the work piece before shutting it off.
15. Always disconnect the sander from the power source when the work is completed.

PORTABLE ROUTER

The router is commonly used to cut irregular shapes and form various contours on the edges and surface of wood projects.

Safety Precautions

1. Always wear safety glasses.

2. Obtain your instructor's permission to use the router.

3. Never wear loose clothing when operating the router.

4. Keep all guards and safety devices in good working order and in place.

5. Always check the power cord for condition, and be sure the power cord is 3-wire and is properly grounded.

6. Make all adjustments with the power source disconnected.

7. Never stand on a wet surface when operating a router.

8. Be sure the switch on the router is off before connecting it to the power source.

9. Always disconnect the router from the power source when inserting bits. The bit must be securely inserted in the chuck at least 1/2", and the base must be tight.

10. Always be certain the work piece is securely fastened and/or clamped so it will not move.

11. Place the router base on the work piece with the bit clear of the work before starting the router.

12. Always grip the router firmly with both hands.

13. Feed the router smoothly through cut. Do not force the router into the work and overload the motor.

14. When the cut is completed, shut off the motor. Do not lift the router from the work piece until the bit has stopped rotating.

15. When the work is completed, disconnect the router from the power source and remove the bit.

PORTABLE ELECTRIC DRILL

The portable electric drill is commonly used for drilling holes in wood, steel and other materials and for reaming, sanding, grinding, buffing and other jobs where the drill must be brought to the work.

Safety Precautions

1. Always wear safety glasses.

2. Obtain your instructor's permission to use the portable electric drill.

3. Never wear loose fitting clothing when using the portable electric drill.

4. Keep all guards and safety devices in place and in good working order.

5. Always check the power cord for condition, and be sure the power cord is 3-wire and is properly grounded.

6. Make all adjustments with the power disconnected.

7. Never operate an electric drill while standing on any wet surface.

8. Always be sure the switch is off before connecting the portable electric drill to the power source.

9. Seat the bit firmly and all the way in the chuck, and tighten it securely with the chuck key.

10. Always remove the chuck key from the chuck as soon as the bit has been tightened or loosened.

11. Be sure the stock to be drilled is securely fastened.

12. Start the drill and observe the bit to be sure it is properly fastened in the chuck and running true.

13. Always position the drill and bit on the work before starting the drill motor.

14. Hold the drill firmly in both hands to maintain the correct drill angle.

15. Never force the drill into the work. The amount of pressure needed will vary according to the bit size and the type of material being drilled.

16. Always remove the drill bit from the chuck as soon as the work is completed.

17. Never lay the drill down until the motor has completely stopped.

18. Never lock the trigger switch on when holding the drill with the hands and drilling holes.

PORTABLE DISK SANDER, POLISHER AND GRINDER

The portable disk sander, polisher and grinder is commonly used in shops for jobs too large to be brought to pedestal- or bench-mounted equipment. Wire wheels are also used on the portable grinder for cleaning and polishing of metals.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the portable grinder.
3. Never wear loose clothing when operating the portable grinder.
4. Keep all guards and safety devices in good working order and in place.
5. Check the cord for condition, and be sure the power cord is 3-wire and is properly grounded.
6. Make all adjustments with the power disconnected.
7. Never stand on a wet surface when using a portable grinder.
8. Be sure the switch is off before connecting to the power source.
9. Make sure the abrasive wheel or abrasive disk or wire wheel is tightened securely.
10. Never force the grinding wheel into the work.
11. Always use an abrasive wheel of the proper type and coarseness for the material being ground.
12. After mounting a new wheel, disk or brush, always allow it to run a few minutes to be certain it is properly mounted.
13. After shutting off the grinder, never stop the wheel by holding it against a work piece.
14. Always be certain the work area is clear so no one will be hit by flying chips or pieces.
15. When shutting off the portable grinder, always wait until the wheel, disk or brush stops rotating before setting the grinder down.
16. It is sometimes advisable to wear gloves, depending on the operation being performed, when using the portable grinder.

17. Always hold the grinder firmly in both hands when operating.

18. Always be certain the work piece is securely fastened before beginning the grinding, polishing or sanding operation.

ELECTRIC IMPACT WRENCH

The electric impact wrench is commonly used in mechanics shops for removing or replacing larger sized nuts and bolts. The use of this tool greatly speeds up assembly and disassembly procedures.

Safety Precautions

1. Always wear safety glasses.
2. Obtain your instructor's permission to use the impact wrench.
3. Never wear loose clothing when operating the electric impact wrench.
4. Keep all guards and safety devices in good working order and in place.
5. Always check the power cord for condition, and be sure the power cord is 3-wire and is properly grounded.
6. Make all adjustments with the power disconnected.
7. Never stand on a wet surface when using an electric impact wrench.
8. Be sure the switch is off before connecting the wrench to the power source.
9. Always disconnect the impact wrench before placing a socket on it. Be certain to use only the sockets designed for use with this tool.
10. Be careful to hold the wrench firmly in both hands.
11. Never attempt to apply the socket to a nut or bolt head while the wrench is turning.
12. As soon as the nut or bolt has loosened, shut the wrench motor off.
13. Remove the socket from the wrench when the job is completed.
14. Allow the wrench to stop completely before laying it down.
15. Disconnect the wrench from the power source. Remove the socket and put the tool away when the job is completed.

PORTABLE AIR POWERED TOOLS

Many of the portable tools considered in the previous eight sections are also available with compressed air as the power source. The safety precautions would be generally the same for air powered tools as for the same electric powered tools, except for the items specifically related to electricity. There are, however, a few specific items which should be considered where compressed air is the power source.

Safety Precautions

1. Be certain the compressed air supplied to the tool does not exceed the limits specified by the manufacturer of the tool.

2. Always check the compressed air hose and connections to be certain the hose is in good condition and all connections are tight.

3. Keep the compressed air hose free from kinks and protect it from being pinched or run over.

4. Place the compressed air line so that no one will trip or otherwise become entangled in it.

5. Never allow horse play with compressed air lines.

ABSTRACT - This teaching guide on agricultural shop safety is one of a 3-part unit for teaching shop and tool safety prepared by the South Carolina State Department of Education and Clemson University Agricultural Education Department. Designed to supplement the student manual, this guide and reference manual contains suggested demonstrations, general safety materials, and safety test questions and answers. Appended are suggested reference books, the South Carolina eye protection law, and a list of available films and filmstrips. Related documents available in this issue are the student manual, VT 012 638, and transparency masters, VT 012 637. (GB)

ACKNOWLEDGMENTS

Appreciation is expressed to all persons who assisted in the preparation of this publication.

Several agriculture teachers—Mr. W. W. Weldon, Florence Area Vocational Center; Mr. James A. Pooser, Southside High School; Mr. Wilson Lovett, Marion-Mullins Vocational Center; Mr. S. W. Stoudenmire, Latta High School; and Mr. I. A. Greene, Mayo High School—gave considerable assistance in preparing and writing content. Mr. F. E. Kirkley, Teacher Educator, Clemson University, gave considerable assistance in writing content and reviewing the manuscript. Miss Kate Salley, artist-illustrator, Vocational Education Media Center prepared most of the drawings and illustrations which appear in this publication. The final copy was prepared and edited by R. T. Benson, Agricultural Materials Specialist, Vocational Education Media Center.

THE SAFETY UNIT

The unit for teaching shop and tool safety is composed of three parts:

1. A student reference manual
2. A teacher guide and reference manual
3. A set of transparencies

The student reference manual is intended for use by the student and contains materials for reading and study. Contained in it are specific safety rules for hand and power tools and specific study materials concerning general shop safety.

The teacher guide and reference manual is designed to supplement the student manual and in certain areas provide information for the teacher only. It contains some suggested demonstrations and other general safety materials for the instructor's information and review in preparation for teaching shop safety.

The transparencies are intended to help the teacher in the classroom presentation of safety instruction.

SUGGESTED TEACHING SEQUENCE

1. Review the material in the teacher guide and reference manual and in the student reference manual before beginning safety instruction with your class. Review the provided transparencies to familiarize yourself with the total teaching unit.

2. Review each tool and demonstrate the safe use of each item of equipment in your shop.

3. If desired, the students can be tested using the suggested test questions and/or the pictures of the various power tools with the labels removed.

INTRODUCTION

A major objective of every instructor must be to prepare his students to work safely in their chosen occupations. Mastery of the skills and knowledge of an occupation are very important, but not any more important than becoming safety-conscious and learning the safe way to do things.

Instruction in safety must be practical—not just preparing students to pass a course or an examination. Safety instruction must develop in the student a safety consciousness, which can be seen as an awareness that serves as a guide for the student's conduct in his life's activities whether they be on the job, in the home or at school. Safety awareness may be thought of and discussed as safety attitudes, and these can be learned in the shop. The results of safety instruction cannot be measured by the number of correctly answered questions on a test, but by the application of correct safety practices in the shop and other evidence of a proper safety awareness. Students must be safety-conscious and alert to dangerous situations. They must know how to prevent accidents, and also be able to apply basic fundamentals of first aid if an accident occurs.

Safety instruction must not be taken lightly. An organized safety unit must be taught early in the school year, preceding any instruction which involves use of tools or equipment that may be hazardous. Correct safety practices and procedures must be followed by the teacher in all activities and at all times, and they must be reviewed as the need arises.

Why teach shop safety? A few of the more important reasons for teaching safety in our agricultural mechanics shops are listed here; you can probably add many more.

The shop is an excellent place to teach a student safety and to help him develop safety consciousness.

A shop provides a good situation for the teacher to demonstrate and practice safe procedures and practices.

The many power tools and equipment used in our shops are dangerous when not used properly.

Improperly used hand tools can cause serious injury.

Many of our shop classes are large, and this situation can cause hazardous working conditions.

Some of the mechanics shops are too small, inadequately equipped and poorly lighted. These conditions demand cautious use of equipment.

And last but not least, anyone can have an accident, and these accidents can vary from very minor to fatal.

Safety instruction includes various practices and activities. These may be considered under two headings: General and Specific.

General Instruction—This might be called "safety management in the shop," and refers to safety policies, housekeeping, student conduct, student dress, fire prevention and control, color coding and zoning, first aid, lifting heavy weights, and electrical safety.

Specific Instruction—This refers to teaching and demonstrating the safe use of hand tools, power tools and equipment.

5702

SAFETY RESPONSIBILITIES

1. *The School Administrator*

The administrator's safety responsibilities include:

a. Promotion of a safety-conscious attitude in all phases of his school's operations.

b. Establishing a safety education program in all departments of his school.

c. The maintenance of safe working conditions, the safeguarding of equipment, and the elimination of health hazards in his school.

d. Insuring compliance with all local and state regulations pertaining to safety in school shops and laboratories.

e. Maintaining contact with the local, state and national agencies which provide safety services.

2. *The Teacher*

The local agricultural teacher is entirely responsible for everything that happens or takes place in the shop. He has the same responsibility in all activities related to the instructional program, whether they be at the school or in field work away from the school.

The teacher's basic safety responsibilities include:

a. Maintaining safe working conditions and practices in his class or laboratory.

b. Providing safety education for his students and encouraging student cooperation in all phases of safety.

c. Recommending needed safety improvements to the school's administrator.

d. Following the recommendations of administrators for the promotion of safe practices and safety education.

e. Keeping up to date on the latest safety practices in education and in industry.

f. Setting a good example for his students by personally observing all safety rules and practices.

3. *The Students*

All students have safety responsibilities, including:

a. Rendering the proper attention to safety instruction.

b. Obeying safety rules and observing safety practices at all times—at home, at school and at work.

c. Being watchful of fellow students in order to prevent their injury through unsafe actions.

d. Notifying the teacher of any unsafe conditions observed so that corrective action may be taken.

Safety—A part of the Teaching Program

Teaching safety is probably the most important phase of an instructional program in agricultural mechanics. We, as teachers, should be more interested in the student than in his learning a new skill. For example, sharpening a rotary mower blade is a fairly simple skill or job. However, in removing the blade, grinding and replacing the blade, the student can easily have an accident. The development of the safety attitude in the student during these job activities is of greater value than merely learning how to sharpen the blade.

Learning shop safety (safety attitude, safety consciousness) has several values for the student.

- He learns to properly use hand tools.
- He learns to safely operate dangerous power equipment.
- The safety attitude once learned will be of future benefit in hazardous occupations.
- Through example or demonstration, the student will teach others safety.

Planning and Organizing a Shop Safety Program

Teaching safety in the agricultural mechanics shop evolves around the three well-known decisions the teacher must first make when planning his educational program. These decisions are:

What to teach in the area of shop safety.

How to use the most effective methods of teaching.

When to teach safety.

The primary purpose of this publication is to answer the first two questions—what to teach and how to use the most effective

methods of teaching. Instruction and suggestions by experienced shop teachers are presented on what are considered the major needs or lessons in the farm shop.

Suggestions for methods of teaching these safety lessons are also included. The teacher should remember that telling is not teaching. For example, telling the student that the jointer is a dangerous piece of equipment is only the beginning or the introduction to the lesson. The student must see (by demonstration) that the jointer is a dangerous machine unless safety rules are observed. He must also see and understand that the jointer can be a safe machine if properly operated.

Some teachers may have to learn to be safety-conscious themselves before teaching this attitude to their students. Whether teaching a group or an individual, teachers should follow very closely the best safety practices in their demonstrations at all times. The example of the teacher will greatly influence the attitude of the student.

5704

TEACHER LIABILITY

This section contains information for the teacher and should not be included as part of the safety instruction program for the students.

1. *Introduction*

Complete coverage of all aspects of teacher liability for student injury is not possible in this brief publication. The infinite number of ways for students to sustain injuries and the varied conditions and situations possible in each case, preclude a quick and easy textbook establishment of responsibility for a given type of injury or circumstance.

This section does describe, in general terms, the liability of teachers for pupil injuries and the elements of proof of negligence which may lead to the liability of a teacher.

In preparation for the performance of his profession, the vocational teacher should familiarize himself with the legal aspects of school accidents and the manner in which he may be held liable.

2. *The School is Immune*

School districts and school boards in South Carolina claim "Common Law," or governmental immunity. Common law immunity, originating in England during the Middle Ages, is based on the principle that "The king can do no wrong." Today, this legal tradition is interpreted to mean a sovereign state can do no wrong and cannot be sued without its own consent. Following this principle, the school district (a division of the government) and the school board (an agency of the state) are immune to tort action. (Tort: "A wrongful act, not including a breach of contract or trust, which results in injury to another's person, property, reputation, or the like, and for which the injured party is entitled to compensation," Random House Dictionary of the English Language, 1966).

While the school district and the school board are immune to suit for damages, the teacher is not. In the case of an accident resulting from negligence, the individual directly responsible (perhaps the teacher) may be held personally liable. The fact that the teacher is employed by a governmental (state) agency does not provide him immunity. In an effort to clarify this point, the office of the Attorney General for South Carolina was contacted. The answer received can best be summed up in this paragraph quoted from the letter received from the Attorney General's office:

"There being no South Carolina Law on the subject, the only advice that can be given is that the teachers try to be as free from negligent conduct as possible. If there is no negligence on the teacher's part, there can be no liability, but if the teacher is negligent, there may be liability. What may constitute negligent conduct of teachers is again unanswerable as we have no cases."

The teacher's actions are governed by the common-law principle that charges every individual to act or use those things under his control to prevent injury to anyone else. A teacher is expected to practice the same degree of care and prudence that any other reasonable person would have practiced in the same or similar situation.

Legally, the teacher's relationship with his students is described by the Latin phrase, "in loco parentis" (in place of the parents). In situations related to the education of his students, society expects the teacher to exercise some of the rights and duties of the parents. The teacher is expected to use reasonable care in the performance of these duties, since students have been entrusted to him.

3. *Types of Accidents*

An accident generally results from an unsafe act or a physical or mechanical hazard. An accident which was unforeseeable, unavoidable and for which no one was to blame is called a "pure accident," and no damages are recoverable. On the other hand, proof of negligence on the part of the person directly responsible for the conditions under which the accident occurred may result in that person having to pay damages.

4. *Negligence*

Negligence, defined as "the failure to exercise due care," is the basic problem in establishing liability.

One may be judged liable if it can be shown that the injuries to another were the direct result of improper actions on the part of the defendant. The teacher cannot be held at fault in cases where his own actions had no reasonable connection with the injury. Conscientious, continuous safety education and safe practices by the teacher, along with student cooperation and participation, are the keys to the avoidance of liability cases.

Specific areas in which the teacher must definitely assume and accept responsibility, thereby reducing the possibility of being negligent, include the following:

a. Supervision—A teacher who leaves a class unsupervised might be judged negligent if a student's injury results from lack of supervision. If called away from the shop, the teacher must stop and lock all power machinery.

b. Machine Guards—The school must provide adequate guards, and the teacher must insure they are used. The teacher allowing the use of unguarded machinery is negligent.

c. Eye Protection—The public schools of South Carolina are required by law to furnish protective eye devices to students and teachers participating in specified vocational and industrial arts laboratories. The teacher is responsible for having his students wear these protective devices.

d. Physical Facilities—The teacher must insure that the working area is safe and that tools and equipment are handled safely. Included in this category are housekeeping and the use of safety clothing.

e. First Aid—Teachers may be negligent in their actions, or failure to act, in the case of an accidental injury. The teacher is expected to do the best he can for the student in case of injury. Teachers should not attempt to go beyond normally accepted first aid procedures. First aid is the care rendered until a physician is obtained. The teacher should have a knowledge of first aid, and first aid equipment should be readily available in the shop. Know your local regulations concerning application of first aid.

f. Permission Slips—Parental releases, or permission slips, may be useful to inform parents of the activities in which their children will participate. These same slips may have a degree of value in causing the students to be more conscious of their actions. The teacher must keep in mind that permission slips do not, in any way, relieve him of his "in loco parentis" responsibility of the teacher for the safety of a student.

g. Liability Insurance—The wise vocational teacher will investigate and select some form of liability insurance, either on an individual or a group basis. Group liability insurance is usually sponsored by educational or professional associations. One example of such coverage is that available to members of the American Vocational Association. Additional information may be obtained from:

American Vocational Association, Inc.
1025 Fifteenth Street, N.W.
Washington, D. C. 20005

5. *Additional Information*

The following publications are highly recommended for additional information on teacher liability:

Kigin, Denis J., Teacher Liability in School-Shop Accidents. Ann Arbor, Michigan: Prakken Publications, Inc., 1963.

Williams, William A., Accident Prevention Manual for Shop Teachers. Chicago: American Technical Society, 1963.

THE PREVENTABLE ACCIDENT

Just what causes an accident? Do all accidents contain some similar factors? If certain factors are present in all accidents, can the elimination of these factors lead to possible prevention of future accidents?

In his book, Industrial Accident Prevention, H. W. Heinrich[1] says that "A preventable accident is one of the five factors in a sequence that results in an injury. The injury is invariably caused by an accident and the accident in turn is always the result of the factor which immediately preceded it. In accident prevention, the bull's eye of the target is in the middle of the sequence—an unsafe act of a person, or a mechanical or physical hazard. The several factors in the accident-occurrence series are given in chronological order in the following list:

"1. Ancestry and social environment
"2. Fault of person
"3. Unsafe act and/or mechanical or physical hazard
"4. The accident
"5. The injury

"The occurrence of a preventable injury is the natural culmination of a series of events or circumstances which invariably occur in a fixed and logical order. One is dependent on the other and one follows because of another, thus making a sequence that may be compared to a row of dominoes placed on end and in such alignment in relation to one another that the fall of the first domino causes the fall of the entire row. An accident is merely one factor in the sequence."

Let's briefly discuss and identify the factors in the accident sequence.

1. Ancestry and Social Environment. We all have probably inherited some personal characteristics that may contribute to an accident. These characteristics might include such things as poor eyesight, bad hearing, or a tendency to be nervous.

Our environment may have caused us to develop habits or behavior patterns that may contribute to accidents. Examples of these might be our tendencies to make and accept dares, show off, and take chances.

We must keep in mind that each of us is a product of our heredity and environment, and that these traits may play a part in an accident.

2. Fault of Person. Personal faults or shortcomings that may contribute to accidents include:

a. A lack of knowledge or skill related to what you are trying to do.

b. Being physically unsuited for the job, such as having poor hearing or vision, being the improper age or height, having allergies, faulty reaction time, and illness or a physical handicap.

c. Improper attitudes, such as willfully disregarding danger, resenting authority, not following instructions properly, being overconfident, getting angry, being over-tired, participating in horseplay, being distracted or hurrying unnecessarily. Personal faults may also result from improper instruction and supervision.

3. Unsafe Act and/or Mechanical or Physical Hazard. An "unsafe act," according to the National Safety Council, is "A violation of a commonly accepted safe practice." Examples of such unsafe acts include:

a. Operating equipment without permission.

b. Operating or working at unsafe speeds (too slow or too fast).

c. Removing or disconnecting safety devices and guards.

d. Using unsafe equipment.

e. Working on moving or dangerous equipment.

f. Horseplay.

g. Failure to use safety clothing or personal protective devices such as respirators, goggles, helmets and gloves.

A mechanical or physical hazard is a condition which could have been guarded, corrected or eliminated. Hazardous conditions are present in machines, vehicles, electrical equipment, hand tools, dusts, radiation, and on working surfaces, such as floors, ramps, roads, shelves and stairs. Specific examples of hazards include unguarded or poorly guarded machinery, insufficient light or ventilation and unsafe clothing.

The combination of an unsafe act and a mechanical or physical hazard results in an accident.

4. The Accident. An accident is an unplanned and uncontrolled event in which an action or reaction of either an object, a person or a substance results in personal injury, or the probability of personal injury. Many accidents

---

[1]Herbert W. Heinrich, Industrial Accident Prevention (New York: McGraw-Hill Book Company, 1959), pp. 14-15.

5707

do not cause injury, but the probability of injury is always present. We don't want to have accidents just so we can see how close we can come to being injured!

5. The Injury. The injury is the damage, hurt or suffering resulting from the accident. Injury may not always be personal, physical pain. Injury can also occur as a loss in pay for being out of work, the loss in damaged equipment or material spoiled, or the loss of time needed to meet a schedule.

Now we have analyzed the accident sequence—

1. Ancestry and social environment
2. Fault of person
3. Unsafe act and/or mechanical or physical hazard
4. The accident
5. The injury

These events occur in a chain reaction—like a row of falling dominoes.

Notice that the removal of the third domino, the unsafe act or hazard, prevents the occurrence of the accident and the injury. The major objectives of safety education are:

1. To teach you to recognize and respect unsafe acts and hazards.
2. To teach you how to avoid injury to yourself and to others by knowing what to do about unsafe acts and hazards.

5708

DEMONSTRATION FOR THE PREVENTABLE ACCIDENT

1. Prepare five wooden blocks, 1" x 2" x 4". These may be painted black with white spots to resemble dominoes. The edges of the blocks should be labeled as follows:

   a. Ancestry and social environment
   b. Fault of person
   c. Unsafe act
   d. The accident
   e. The injury

2. Prepare a sheet metal frame, U-shaped, about 14 inches long, with slots every 3 inches.

3. Place wood screws in base of edges of previously prepared wooden blocks and leave screw so head is about 1/8 inch from wood.

4. Place blocks in the metal tray so that screw heads are in slots in side of tray. Place them in the order (a) through (e) in 1. above and so the students can read the labels on the edge.

5. Push block (a), Ancestry and social environment, and note how each block causes the next to fall—the accident sequence.

6. Remove block (c), Unsafe act, and push block (a) again and note that if the unsafe act is removed the sequence is broken and the last two remain standing.

SHOP AND LAB SAFETY

1. *General Recommendations*

   a. Insure that students know fundamentals of first aid and procedures to follow in case of fire.

   b. Promote safety at all times.

   c. Require active student participation in safety activities.

   d. Use color coding on machines and hazard strips on floors. Teach students the meaning and importance of such codes.

2. *Color Coding for Safety*

A summary of the industrial color codes developed by the American Standards Association for industrial use is presented in the student reference manual.

3. *Protective Clothing and Equipment*

Protective clothing and equipment will not prevent accidents and injuries; but when properly used, such items may serve to lessen the resulting degree of damage or injury.

The wise and proper use of protective clothing and equipment by students will be the result of good personal safety habits inspired by the teacher. The student must be taught to prepare himself to enter the school shop or lab safely so that, in future years, he will be a safety-conscious worker.

The teacher might start by "checking" the personal appearance of class members before beginning lab work. This checking should consist of reminding everyone to have his sleeves rolled up, rings and watches placed in pockets, and ties tucked in or removed. As soon as students know the routine, develop class participation through the use of a "safety inspector" or a "buddy system."

a. Eye Protection

The requirements for eye protection and the minimum quality standards of safety glasses are specified by the South Carolina Eye Protection Act, reproduced in its entirety in the Appendix of this publication. Of special importance to administrators and teachers is the requirement to provide visitors to the shop with eye protection. All areas requiring eye protection should be marked by signs, such as "Eye Protection Required Beyond This Point." Mounting the storage rack for both students' and visitors' safety glasses near the shop entrance is recommended.

Eye protection equipment may be disinfected by thorough cleaning with soap and warm water, or by a complete immersion in a "Lysol" solution. Commercially available storage cabinets include one type which has ultraviolet lamps that come on when the cabinet doors are closed, for the purpose of sanitizing safety glasses.

b. Head and Ear Protection

Although head and ear injuries are not very common in school shops, "hard" hats are highly recommended for programs such as building construction, where there is a possibility of being struck by a falling object. Again, providing for the safety and protection of visitors is recommended.

c. Hand, Foot and Leg Protection

The majority of all disabling injuries occur to hands, legs and feet. Finger injuries are the most frequent.

d. Respiratory Equipment

Filter respirators are available for protection against various types of dust, mists and fumes. Extreme care must be exercised when selecting filters, as a false sense of security can be generated by a filter not appropriate to the hazard present. Before selecting filters, carefully evaluate the hazards present, the exposure conditions and the characteristics of available filters. An additional factor will be the need for periodically cleaning and sanitizing the filters. A very important point for the teacher to emphasize is that a filter may remove dusts and some fumes, but may not be capable of protecting the user from carbon monoxide or carbon tetrachloride fumes at all.

(Additional point: Carbon tetrachloride, formerly used as a cleaning agent and as a filler for fire extinguishers, should never be used for anything! Less toxic agents are available. Carbon tetrachloride is no longer recommended as a cleaning agent.)

e. Body Protection

Shop coats, aprons and coveralls should be used as appropriate in shops and labs. Aprons should be tied securely to prevent getting caught in machinery.

5710

4. *Fire Safety and Fire Extinguishers*

General information concerning fire extinguishers and fire safety is presented in the student reference manual.

5. *Electrical Safety*

Electrical equipment is found in nearly every vocational subject area. Students should be taught the dangers present in electrical equipment and wiring and how to protect themselves and others from injury.

a. General Electrical Safety

(1) Install all electrical wiring in compliance with the National Electrical Code.

(2) Never use temporary wiring. All extension cords for tools and appliances should be 3-wire parallel ground with grounding lug plugs.

(3) Teach students to assume that all electrical equipment and wiring is "alive" and must be treated as such.

(4) Students should be taught the importance of safety interlocks and the dangers of by-passing electrical safety devices, such as circuit breakers.

(5) Never work on electrical equipment alone—always have someone else nearby.

(6) While working on electrical equipment, stand on rubber mats or wooden floors.

b. Rescue from Electrical Shock

A person may receive an electrical shock by touching a bare wire, an exposed socket or a faulty electrical tool or appliance. Shock hazards also exist inside various types of electronic equipment and around power lines. The possibility of shock is greatly increased if the person is also in contact with a grounded surface, or if the floor or his body is wet.

(1) If possible, shut off the current quickly.

(2) If the current cannot be shut off promptly, attempt to move the victim away from the conductor, using some sort of insulated material.

(3) Do not touch the victim until electrical contact is broken. Use a wooden pole, such as a broom handle, to separate the victim and the conductor. A large cloth, such as a coat, may also be used.

(4) A live conductor may cling to the victim, making it necessary to pull him (or the conductor) quite a distance away.

(5) If the victim is not breathing after he has been removed from contact with the conductor, give him artificial respiration.

6. *First Aid*

First aid is the immediate care given to an injured or sick person until the service of a physician can be obtained.

Teachers of vocational subjects should be qualified to administer first aid. The shop should be equipped with a good general first aid kit containing bandages, gauze, cotton, tape, gauze pads, band-aids, eye pads, triangular bandages, tourniquet, ammonia, cotton buds, splints, measuring cups, scissors, tweezers, antiseptic cream and a first aid guide booklet.

The first aid program of the American National Red Cross provides for the training and certification of both instructors and students in first aid procedures. The Red Cross also publishes instructors' and students' handbooks. For additional information on first aid training and certification, contact your local Red Cross chapter.

A complete coverage of all first aid procedures is not possible in this brief publication. A summary of recommended first aid procedures covering those situations most likely to be encountered in the agricultural mechanics shop is included in the student reference manual.

7. *Lifting Heavy Weights*

Proper lifting is a skill. Attaining this skill could prevent sprains, back injuries and ruptures. High school age boys are prone to demonstrate their strength to each other, not realizing the safe limits of their muscle ability. They must have demonstrated to them that unwise muscular activities may cause life-long injury to their backs.

To lift an object, place feet eight to twelve inches apart, keep the feet close to the object that is being lifted—this will keep the back muscles from having to lift all the load. Bend Knees outward and keep the back straight. Lift the object by pushing up with the legs. Keep the object close to the body.

To turn with the object lifted, shift the feet in the direction of travel. Never twist the body.

To place object on floor, reverse the lifting procedure; keep back straight, lower load by bending knees, be sure blocks are on floor so the fingers will not be mashed or pinched.

Demonstration: Why is the back subject to injury? With 10 or 12 one inch square blocks stacked on top of each other, show how little force is needed to push them over. Now place a five pound block of lead on top of the blocks. Relate the blocks to the vertebra of the backbone. Have several sets of blocks so each student may perform the experiment.

The correct lifting procedure: Lift a 15 or 20 pound block of concrete using the correct procedure. Point out to the class the parts of the body doing the work and the position of the vertebra. Provide a light object, such as an empty cardboard carton. Lift this incorrectly, point out the position of the vertebra, and contrast the parts of the body doing the work. (Position for incorrect lifting: legs straight, feet away from object and back arched over the object.)

Have each student lift heavy object correctly several times.

Objects too heavy: Caution students that it is better to ask for help with lifting heavy loads than to risk an injury.

Using a slab of concrete that weighs about 100 pounds, have the student make a reasonable effort to slide it on a concrete floor. Then place several pieces of pipe between the slab and the floor. Now it rolls very easily. Be certain to keep at least two pieces of pipe evenly spaced under the slab at all times. Let each student take his turn.

Objects that are large or bulky but light: Be sure you can see where you are walking when carrying these loads. Even if they are light in weight, you may need help to see ahead. This is especially important when going up or down steps and around cluttered areas.

Demonstrate with a large cardboard container carried by one person, and contrast with two persons carrying the container. Emphasize that sight, not weight, is important here.

Reference: M. O'Brien, Shopwork Teaching Tricks (Interstate Publishers, Danville, Ill., 1956).

8. *Housekeeping in the Shop*

A clean, well-kept shop would involve the following:

- Storing tools in their proper places after use.
- Storing all lumber and other items after use.
- The proper storage of inflammable materials.
- Storing finished and unfinished shop projects.
- Turning off electrical switches and lights after work.
- Removing all waste materials (sawdust, shavings, metals, etc.) daily.
- Sweeping floors after use.
- Cleaning floors of any grease, oil, acid and water.
- Encouraging students and farmers to remove completed projects from shop immediately.
- Seeing that the shop is kept in good working condition at all times. Some materials should be moved immediately rather than waiting until the end of the shop period. Avoid letting the shop become a dumping place for the school.
- Placing scrap stock in properly marked boxes.
- Cleaning equipment and tools after use.
- Cleaning electric lights monthly.
- Washing windows once each month.
- Cleaning shop walls and ceiling once each year.

Suggestions for Teaching:

a. List with class the daily jobs to be done to have a clean and orderly shop.

b. Have class clean and arrange shop as it should be kept in the future.

c. Discuss and decide on tool storage: (1) system used; (2) individual responsibility; (3) reporting defection of tools.

d. Delegate responsibilities by classes.

e. Discuss possibility of using check sheet after shop period.

9. *Shop Safety Policies*

For the shop to be a safe place for work, certain safety policies (rules and regulations) must be followed by all. This includes the

teacher, students and farmers. Reading this list of shop safety policies and posting them on the walls will not result in their being followed. These policies—the purpose, the need and the adoption of such—must be developed with the classes that will use the shop. The students must understand the necessity of having such regulations and be willing to abide by them.

a. Disconnect power equipment when not in use.

b. Safety glasses, goggles or face shields must be used at all times.

c. Shop classes must be supervised at all times.

d. Students must not operate equipment without teacher's permission.

e. Defective and faulty machines and equipment should not be operated; label machines not safe to use.

f. All machines should have proper guards whether in use or not.

g. All machines must be stopped (shut off) before lubricating or adjusting.

h. No one should stand in line with a revolving wheel or tool.

i. No conversation is allowed between machine operator and student.

j. All hand tools must be sharp and in safe condition before use.

k. Each student should be responsible for the proper storage of tools, supplies, etc. that he is using.

l. Any oil or grease on floors must be removed immediately.

m. Power machines should not be used for trivial operations; use hand tools.

n. All welding must be done in booths or behind protective screens.

o. All power machines should be allowed to stop by themselves after electricity is cut off. Stay with the machine until it stops.

p. Never throw a tool or piece of material to anyone.

q. Loose fitting clothing and long neck ties will not be worn in shop. (Encourage the wearing of coveralls.)

r. Files and similar tools should not be used without handles.

s. All students should know how to use fire extinguishers, which should be conveniently located.

t. All lumber should be inspected for loose knots, splits, and nails before running it through machines.

u. Have electrical motors and equipment inspected for wiring, fusing and grounding.

v. Shop must be kept clean and orderly at all times.

w. Safety inspection of shop will be made monthly.

x. Post and observe fire regulations.

y. Gasoline should not be stored in the shop; keep other inflammables in red containers.

Suggestions for Teaching:

(1) Take group or class into the shop.

(2) Develop the need for establishing and abiding by policies.

(3) Have the class gather around a power tool.

(4) Question the class as to needed safety rules for this piece of equipment.

(5) Follow a similar method for developing and adopting the remaining policies.

(6) Type several copies of the adopted policies.

(7) Review the policies with the class.

(8) Observe and check shop activities to see that policies are followed.

POWER TOOLS

TEACHER DEMONSTRATIONS: GENERAL SUGGESTIONS

The demonstrations presented here are suggested as general guide lines for the teacher in presenting demonstrations on the safe use of the various power tools. Specific safety precautions for each tool are presented in the student reference manual. During these demonstrations the teacher should emphasize all safety aspects as they relate to specific pieces of equipment and to general shop work. At all times the teacher should have with him and be familiar with the operator's manual for the specific tool in his shop. The tools vary somewhat from manufacturer to manufacturer, so specific procedural steps may differ from tool to tool. The demonstration should provide the instructor with the opportunity to demonstrate all safety features of and practices to be used with the specific tool.

The instructor must be thoroughly familiar with the specific tool, its features and its safe use. Previous preparation and parctice will make these demonstrations much more meaningful and valuable to the student. The use of student cooperation can sometimes be very helpful in these demonstrations. Students can read specific instructions, answer questions and help hold or support large work pieces where required.

To help the instructor prepare for and give these demonstrations, a few specific suggestions follow:

1. Prepare beforehand; assemble all needed materials, equipment and references. Be sure to practice the entire demonstration before presenting it to the class.

2. Wear safety glasses at all times. This is a state law, so protect yourself. Present a good image by wearing an approved type of eye protective device at all times. Students must be required to wear approved eye protective devices at all times.

3. Dress properly for shop work at all times.

   a. Remove all rings, watches and other jewelry.

   b. Roll up or otherwise fasten sleeves.

   c. Remove or otherwise secure your tie.

   d. As required for the job to be done, wear a properly fitted shop coat or coveralls.

   Present yourself, the instructor, as an example of the proper way to dress and protect yourself when performing work in the agricultural mechanics shop. For further information, refer to the section entitled, "Protective Clothing and Equipment," in the student manual.

4. Situate or locate the class so that all students can observe the demonstration. Be certain that all students are not in a danger area so that if something should happen none of them will be hit by flying objects, either work pieces or broken pieces of material. All students should be properly dressed for shop work with safety glasses and proper clothing.

5. Perform the demonstration.

6. After completing the demonstration, hold a class discussion concerning the proper and safe use of the specific tool under consideration. Question students and otherwise encourage a thorough examination of the procedures just demonstrated. Help students find answers to all of their questions. Finally, if required, repeat the entire demonstration.

7. After the demonstration and discussion, have the students repeat the procedure under your supervision. Watch them carefully and correct any student errors as they occur. After each student or group of students have finished, again hold class discussions or critiques concerning the students' procedures or methods. Assist the students in determining the answers to their questions.

8. A list of questions concerning the safe use of the specific piece of equipment is presented following this section. This can be used for a short quiz on each tool or as a general safety test.

ONE: USING THE JOINTER

Materials:

Jointer in good condition
Safety glasses
1" x 4" x 24" work piece
Operator's manual for jointer
List of safety practices

Procedure:

1. Check the stock for loose knots, nails and other defects.

2. With power off, check jointer blades for sharpness and adjustment according to the operator's manual.

3. Set front table to the desired depth of cut (about 1/8" for rough cut and 1/16" for finish cut).

4. Lock the fence in the desired position. Turn on the switch or power.

5. Place edge of stock on front table, and apply downward and sideward pressure on stock to hold it firmly against table and fence.

6. Start the stock through. Hold it down on the front table until the leading edge has passed the cutter head, then move the left hand beyond the cutter head. Maintain the downward and sideward pressure at all times. Continue feeding the stock, using the right hand.

7. Shut off jointer and wait until cutter head stops.

TWO: USING THE PLANER

Materials:

Planer in good condition
Blade guage and wrenches for knife adjustment
Stock 1" x 6" x 5', several pieces free of defects
Operator's manual for planer
List of safety practices

Procedure:

1. Check stock for loose knots, nails and other defects.

2. With power off, check planer blades for sharpness and proper adjustment according to the operator's manual.

3. Adjust table to proper thickness of stock to be surfaced.

4. Start the planer, begin feeding stock and engage clutch.

5. Use gloves if rough stock is being planed.

6. Let stock go free after the in-feed end has passed the rear table feed rolls.

7. When planing long stock, a roller support should be used to support the stock on the in-feed and out-feed side of the planer. Short stock may be supported by hand.

8. When stock exits from the machine, shut the planer off and wait until the machine stops completely.

THREE: USING THE TABLE SAW

Materials:

Table saw in good condition
Sharp blade properly set
Rule or square
Stock 1" x 12" x 5' (Several pieces)
Push stick
Operator's manual for table saw
List of safety practices

Procedure:

1. Check the stock for knots, nails and other defects.
2. With power off, check blade for sharpness, set and tightness on arbor, using the operator's manual.
3. Adjust blade so that it projects about 1/8"-1/4" above the stock to be cut, and lock the handwheel.
4. Set the rip fence to the desired width, and lock both the front and rear rip fence clamps. Check setting with ruler.
5. Lower the guard and make sure the anti-kickback device is in place.
6. Select jointed or straight edge of stock, and place this edge against the fence.
7. Start the table saw.
8. Feed the stock gently into the saw.
9. Push the stock through completely and allow it to drop, or have an assistant on the opposite side of the saw receive it.
10. Use a push stick to cut narrow stock.
11. Shut off the table saw, and wait until it comes to a complete stop.

FOUR: USING THE RADIAL ARM SAW

Materials:

Radial arm saw in good condition
Sharp blade for saw properly set
1" x 4" x 4' (several pieces)
Operator's manual for the radial arm saw
List of safety practices

Procedure:

1. Check stock for knots, nails, and other defects.
2. With the power off check blade for sharpness, set and tightness according to the operator's manual.
3. Set up radial arm saw for cross-cutting operation; check squareness of blade with fence, using a framing or try square, and check that saw blade will not cut into the table.
4. Start radial arm saw and be sure blade is rotating downward before making cut.
5. Firmly hold the stock against the fence.
6. Stiffen your arm and pull the saw very slowly through the stock.
7. Push saw back and shut it off; do not leave the area until the saw blade has stopped rotating.
8. Set the stop, if there is one on the saw, to prevent the saw from rolling forward or accidently being pulled forward.

5716

FIVE: USING THE BAND SAW

Materials:

Band saw in good condition
Proper size blade for diameter of circle to be cut
A circle cutting jig if available
1" x 10" x 12" wood or plywood (several pieces)
Operator's manual for the band saw
List of safety practices for the band saw

Procedure:

1. Check the stock for knots, nails and other defects.

2. With the power off check the blade for width, sharpness, set and general condition, and for adjustment according to the operator's manual.

3. Adjust lower blade guard so that it clears the work piece by 1/8"-1/4".

4. If jig is available, set it up for size of circle desired. If no jig is available, mark the circle desired; be sure the minimum radius is not too small for the blade being used.

5. Start the saw; stand directly behind the line of cut, if possible.

6. Feed the work piece slowly through with the right hand, and guide it with the left.

7. Complete the cut, shut off band saw, and wait until the blade stops completely. (Use the brake, if available.)

SIX: USING THE JIG SAW

Materials:

Jig saw in good condition
Proper blade for materials to be cut
Work piece already marked
Operator's manual for the jig saw
List of safety practices

Procedure:

1. Check the stock for knots and other defects.

2. With the power off, check the jig saw for blade tension and clearance; roll over by hand to check all adjustments and clearance.

3. Adjust the hold down so that stock will not be lifted up during the cutting operation.

4. Start the saw and begin feeding the work piece slowly into the saw. Do not force the work piece, and be certain your fingers are not in the direct line of the cut.

5. Complete the cut. Always stress safety.

6. Shut off the saw, and wait until it stops completely.

SEVEN: USING THE DRILL PRESS

Materials:

Drill press in good condition
Correct drill bit for material being drilled
Work piece
Correct vise or clamp for work piece
Operator's manual for the drill press
List of safety precautions

Procedure:

1. With power off, set up drill press for the job to be done. Insert drill bit and tighten with chuck key. Remove chuck key.

2. Adjust drill table to proper height with the drill bit in line with the center hole in the table and set the depth stop.

3. Set work piece under drill bit, and fasten securely with a vise or clamp.

4. Start the drill and cautiously lower the drill bit through the work piece.

5. Raise drill bit slowly from the work piece after the hole has been completed.

6. Shut off drill press and wait until it has completely stopped before leaving the machine.

EIGHT: USING THE DISK SANDER

Materials:

Disk sander in good condition
Abrasive disk of proper coarseness for the job
Work piece to be shaped
Operator's manual for the disk sander
List of safety practices

Procedure:

1. With the power off, check the abrasive disk and the sander for proper adjustment and setup.

2. Set the table up for the job to be done.

3. Start the sander and slowly feed the work into the side of the disk which is rotating downward toward the table. On this surface, move and position the work piece to complete the job selected. Keep fingers at least 2 inches from the disk.

4. After completing the job, shut off the sander and wait until the sander disk stops completely.

NINE: USING THE BELT SANDER

Materials:

Belt sander in good condition
Abrasive belt of correct coarseness for the job
Work piece to be sanded
Pad or push stick
Operator's manual for the belt sander
List of safety practices

Procedure:

1. With the power off, check the abrasive belt and the sander for proper adjustment and setup.

2. Start the sander and watch to make sure the belt tracks properly. Adjust it, if required.

3. Begin sanding the work piece, using the pad or push stick if needed. Always keep hands as far away from the abrasive belt as possible.

4. After completing the sanding job, shut off the sander and wait until the belt stops completely.

TEN: USING THE WOOD LATHE

Materials:

Wood lathe in good condition
Lathe tools in good condition
Properly prepared work piece, marked for centers
Operator's manual for the wood lathe
List of safety practices

Procedure:

1. Check the wood lathe for proper set up and adjustment for the job to be done.

2. Properly center the work piece and firmly secure it in the lathe.

3. Adjust the tool rest so that it clears the side of the work piece by about 1/8", and lock the tool rest support to the lathe bed. Keep the tool rest adjusted so the cutting action is above the center of the work piece. Be sure work piece will clear tool rest. Rotate by hand before starting the lathe.

4. Adjust speed of lathe for size of stock.

5. Select the proper tool for the job.

6. Hold the chisel properly in both hands, standing slightly to one side of the cut; and beginning at left end of work piece, take small cuts.

7. Continue the cutting until stock is the proper or desired size and shape; at all times keep tool rest adjusted to about 1/8" clearance of work piece. Stop the lathe to make all adjustments and measurements.

8. Shut off the lathe and wait until it stops before leaving the area.

5719

ELEVEN: USING THE POWER HACKSAW

Materials:

Power hacksaw in good condition
Stock to be cut
Operator's manual for the power hacksaw
List of safety practices for the power hacksaw

Procedure:

1. With the power off, check the blade for sharpness, set and tension according to the operator's manual.

2. Secure the stock to be cut in the vise. Be sure stock is properly placed in vise.

3. Start hacksaw and gently lower blade to stock being cut. Set speed of feed for proper speed. This is determined by the hardness of materials being cut.

4. After cut is completed, shut off saw. If it does not have an automatic stop, allow saw to stop completely; then raise blade to highest position before leaving the saw.

TWELVE: USING THE GRINDER

Materials:

A grinder in good condition
Grinding wheel dresser
Wrench to adjust tool rest
Chisel with mushroomed end
Operator's manual for grinder
List of safety practices

Procedure:

1. Check the grinder for proper guard and tool rest adjustment, and check grinding wheel for trueness. Dress, if needed.

2. Start the grinder and allow it to reach operating speed before beginning to grind the chisel.

3. Position the chisel on the tool rest, holding it firmly. Without applying excessive pressure, begin grinding and slowly rotate the chisel until it is properly ground.

4. Remove chisel from grinding wheel. Shut off grinder and wait until the wheel completely stops before leaving the area. Never grind on a wheel coasting to a stop.

5720

THIRTEEN: USING THE ENGINE LATHE

Materials:

Engine lathe in good condition
Proper tools and holding devices
Work piece
Operator's manual for the engine lathe
List of safety practices

Procedure:

1. Check the lathe for proper adjustment and proper speed for the job to be done.

2. Mark, center punch and drill work piece to be turned.

3. Using the face plate and lathe dog, mount the work piece on the lathe centers. Be sure dog is fastened securely and tail stock is locked in place.

4. Turn set up by hand to be sure it has sufficient clearance and does not bind.

5. Using proper tool and tool holder, set up tool post. Tool should cut on the center line of the stock.

6. Turn on lathe and slowly feed tool into the work until the desired depth of cut is reached, then engage automatic feed. Be certain to stop feed before the tool engages or hits the lathe dog.

7. Back out the cutting tool, shut off the lathe, and wait until it completely stops before leaving the area.

FOURTEEN: USING THE OXYACETYLENE WELDER

Materials:

Oxyacetylene welding equipment in good condition
Welding tip
Welding goggles
Gloves
Flint lighter
Operator's manual for the welding equipment
List of safety practices

Procedure:

1. Wear welding goggles, gloves and be sure clothing is not loose or grease soaked. Present yourself as an example of the proper way to dress when using oxyacetylene welding equipment.

2. Turn on gas, acetylene only one turn, oxygen all the way.

3. Check all hoses and connections for leaks.

4. Adjust oxygen and acetylene regulators to the proper pressure for the tip selected for this demonstration. (See operator's manual.)

5. On the torch, open acetylene valve about 1/8 of a turn. Using the flint lighter with the torch pointed away from your body and not toward anyone, light the torch.

6. Open the acetylene valve until the flame no longer smokes or until the flame almost leaves the tip.

7. Open oxygen valve until a neutral flame is produced.

8. Shut off acetylene valve first, then oxygen valve on the torch.

9. Shut down equipment completely and bleed lines.

FIFTEEN: USING THE ELECTRIC ARC WELDER

Materials:

Electric arc welder in good condition
Electrodes and metal
Head shield for self and class
Proper protective clothing
Operator's manual for welder
List of safety practices

Procedure:

1. Wear head shield with proper shade lens and heavy leather gloves. Be sure clothing completely covers the body. Present yourself as an example of the proper way to dress when using the electric arc welder.

2. Provide all students with face shields with the proper shade lens.

3. Check your welder and accessories to determine that everything is in good working order.

4. Demonstrate the proper way to strike the arc, and run a bead without power to the welder.

5. Turn on welder and have all students cover up with the provided face shields. Now drop your head shield in place and proceed to strike the arc and run the bead.

6. Shut off welder, lift head shield and place the electrode stub in the proper container.

7. Using safety glasses or head shield with flip-up lens, chip the slag from the weld; be certain not to chip toward the student. Students should wear their safety glasses during this operation. Cool the weld or mark it as hot, and place in the proper container or area.

SIXTEEN: USING THE HYDRAULIC PRESS

Materials:

Hydraulic press in good condition
Correct supports, jigs and clamps for job to be done
Work piece
Operator's manual for the hydraulic press
List of safety practices

Procedure:

1. With the pressure relieved, check the hydraulic press for adjustment and proper setup.

2. Adjust the work table to the proper height for the job to be done.

3. Set up the work piece, using sufficient supports or other devices to hold it in a suitable working position.

4. Begin to slowly apply pressure to the work piece.

5. Stop applying pressure periodically, and check to see that all is going right.

6. After work has been completed, slowly release the pressure. Do not leave the press until all the pressure has been relieved.

SEVENTEEN: USING JACKS

Materials:

Jack in good condition
Object to be raised
Jack stands or supporting blocks
Operator's manual for the jack
List of safety practices

Procedure:

1. Check the jack for proper adjustment and setup.

2. Place jack under the lift point of the object, and slowly begin to raise the object.

3. Stop jacking periodically to check that all is going well.

4. When object is raised to the desired position, place the supporting blocks or jack stands so as to allow a person to work safely under the raised object, if necessary.

5. Remove the supporting blocks or jack stands, and slowly lower the object. Remove the jack. Do not leave the object raised.

EIGHTEEN: USING THE CHAIN HOIST

Materials:

Chain hoist in good shape
Chains, cables or other lifting devices
Object to be lifted
Operator's manual for the chain hoist
List of safety practices

Procedure:

1. Check the chain hoist for proper adjustment and operation.

2. Using the necessary chains, cables or lifting devices, properly secure the object to be lifted to the hook on the chain hoist.

3. Begin raising the object slowly. As soon as the load is on the lifting devices and the chain hoist, stop raising the object and check the connections for security.

4. Complete raising the object.

5. Slowly lower the object until all weight is removed from the lifting devices and the chain hoist.

NINETEEN: USING THE STEAM CLEANER

Materials:

Steam cleaner in good working condition
Object to be cleaned (motor, tractor, etc.)
Water and electrical supply, detergent
Heavy gloves
Operator's manual for the steam cleaner
List of safety practices

Procedure:

1. Check the steam cleaner for adjustment, electrical hookup and water inlet hookup and flow. (See owner's manual.)

2. Put in detergent according to the operator's manual.

3. Start water pump and check outflow before starting the burner.

4. Start burner and check for proper operation and steam output. Also check safety blowout plug for security and position.

5. Hold steam hose by the insulated handle in both hands, and clean the object selected for cleaning.

6. After cleaning is completed:

   a. Shut off burner and wait until the water flowing from the steam hose is cool.

   b. Shut off water pump.

   c. Shut off input water.

   d. Shut off electric service to steam cleaner.

TWENTY: USING THE PORTABLE CIRCULAR SAW

Materials:

Portable circular saw in good condition
Sharp properly set blade
Work piece
Operator's manual for the portable circular saw
List of safety practices

Procedure:

1. Fasten and/or support the work piece securely in preparation for the cutting operation.

2. Inspect the power cord for condition and proper grounding.

3. Check the blade for sharpness, set and tightness.

4. Check the blade guards to be sure they are in proper working condition.

5. Set the saw blade to the proper depth of cut, the thickness of the stock, plus 1/8".

6. Check to be sure the switch is off; connect the saw to the power source.

7. Bring the saw blade up to the desired point of the cut, back off so the blade does not touch the wood, and start the saw motor.

8. When the motor reaches operating speed, advance the saw through the work.

9. After completing the cut, release the switch and hold the saw until the blade stops rotating. Then set the saw down.

TWENTY-ONE: USING THE PORTABLE SABER SAW

Materials:

Saber saw in good condition
Saw blade for material to be cut
Tools to put in saw blade
Work piece
Operator's manual for the saber saw
List of safety practices

Procedure:

1. Fasten and/or support the work piece securely for the cutting job to be performed.

2. Inspect the power cord for condition and proper grounding.

3. Insert the blade and tighten securely.

4. Check to be sure the switch is off. Connect the saber saw to the power source.

5. Grasp the saw firmly in both hands and start the motor. Check to be sure the blade is operating correctly and is secure.

6. Line the saw up with the cut to be made. Place base firmly on the work piece, and be sure blade does not contact the work piece. Start the motor and advance the blade into the work piece. Keep pressure enough to keep the blade cutting, but not so much as to overload the motor or break the blade.

7. After completing the cut, stop the motor and wait until the blade stops completely before setting the saw down.

TWENTY-TWO: USING THE PORTABLE BELT SANDER

Materials:

Portable belt sander in good condition
Proper size and grade belt for selected job
Work piece to be sanded
Operator's manual for the portable belt sander
List of safety practices

Procedure:

1. Fasten the work piece firmly in a vise or other jig in preparation for the sanding operation.

2. Inspect the cord for condition and proper grounding.

3. Install the belt, following the operator's manual; and check the belt for proper tracking. Adjust if needed.

4. Check to be sure the switch is off; connect the sander to the power sources.

5. Grasp the portable belt sander firmly in both hands; start the motor, and slowly lower the belt to the work piece; allow the heel to touch first, and level the machine as it moves forward. Sand with the grain, using a slow back and forth movement. Never stop in one place.

6. Lift the sander from the work piece before stopping the motor. Stop the motor.

7. Allow the belt to stop completely before placing the sander on the work bench.

TWENTY-THREE: USING THE PORTABLE FINISHING SANDER

Materials:

Finishing sander in good condition
Proper grade of abrasive paper for job
Work piece
Operator's manual for the finishing sander
List of safety practices

Procedure:

1. Depending on size of work piece, fasten the work piece if needed.

2. Inspect the power cord for condition and proper grounding.

3. Properly place the abrasive paper on the finishing sander.

4. Check to be sure the seitch is off; connect the sander to the power source.

5. Hold the sander firmly above the work piece. Start it and apply it to the work piece.

6. When the job is done, lift the sander from the work piece and shut it off.

7. Disconnect the sander from the power source and set it aside.

TWENTY-FOUR: USING THE PORTABLE ROUTER

Materials:

Router in good condition
Router bit for job selected
Tools needed to put bit in router
Work piece, properly prepared and free of defects
Vise or clamps
Operator's manual for the router
List of safety practices

Procedure:

1. Fasten the work piece securely for the routing job to be performed.

2. Inspect the power cord for condition and proper grounding.

3. Insert the selected router bit and tighten securely.

4. Check to be sure the switch is off; connect the router to the power source.

5. Hold the router firmly in both hands at all times.

6. Place the base of the router on the work piece. Be sure the router bit is not touching, and start the router motor.

7. Move the router smoothly into the cut in the proper direction, counter clockwise usually, being careful not to overload the router motor.

8. After completing the cut, shut off the router. Do not raise the router from the work until the bit stops rotating.

9. Disconnect the router from the power source and remove the bit before setting the router aside.

TWENTY-FIVE: USING THE PORTABLE ELECTRIC DRILL

Materials:

Portable electric drill in good condition
Sharp drill bit
Mild steel, center punched for hole
Vise
Operator's manual for the portable electric drill
List of safety practices

Procedure:

1. Fasten the work piece firmly in the vise in preparation for drilling the hole.

2. Inspect the drill and cord to make sure it is in good condition and properly grounded.

3. Place the drill bit all the way in the chuck, and tighten it securely with the chuck key. Immediately remove the chuck key.

4. Check to be sure the switch is off. Connect the drill to the power source.

5. Start the drill and observe that the drill bit is properly inserted and running true. Stop the drill.

6. Position the drill over the work piece with the bit in the center punch mark and the drill at the correct angle for the hole to be drilled.

7. Hold the drill firmly with both hands. Start the motor and feed the drill bit into the work piece. Apply enough pressure to keep the bit cutting; don't force the drill bit. Ease off the pressure slightly as bit begins to break through; this will prevent burrs and the drill bit should not grab. Do not lock the switch on the drill in the "on" position.

8. Stop the drill and withdraw the drill bit; allow the drill to stop completely; remove the drill bit from the chuck, and remove the chuck key from the chuck. Put the drill bit in its proper location, and lay the drill down.

TWENTY-SIX: USING THE PORTABLE DISK SANDER, POLISHER AND GRINDER

Materials:

Portable grinder in good condition
Abrasive wheel of proper type
Tools necessary to fasten disk and adjust guards
Work piece to be ground
Operator's manual for the portable disk sander
List of safety practices

Procedure:

1. Fasten the work piece securely in preparation for the grinding operation to be performed.

2. Mount the grinding disk properly and securely; inspect the cord for condition and grounding; adjust the guard.

3. Check to be sure the switch is off; connect the grinder to the power source.

4. Start the grinder, and check for disk mounting and general proper operation.

5. Grasp the grinder firmly in both hands; and when the grinder reaches operating speed, begin the grinding operation.

6. Move the grinder slowly over the area to be ground to prevent overheating. Do not apply excessive pressure to the portable grinder in an attempt to speed up the operation.

7. Stop the grinder and wait until the wheel stops rotating completely before placing the portable grinder down.

TWENTY-SEVEN: USING THE PORTABLE ELECTRIC IMPACT WRENCH

Materials:

Electric impact wrench in good condition
Correct size and type of socket
Bolts and nuts to be tightened and loosened on a piece of machinery
Operator's manual for the impact wrench
List of safety practices

Procedure:

1. Inspect the power cord for condition and proper grounding.
2. Firmly place the correct size socket on the wrench for the job to be done.
3. Check to be sure the switch is off; connect the wrench to the power source.
4. Firmly grip the wrench in both hands, and place the socket over the nut or bolt to be tightened or loosened.
5. Remove the wrench from the nut or bolt after the wrench has stopped.
6. Remove the socket; disconnect the wrench from the power source and set aside.

TWENTY-EIGHT: USING PORTABLE AIR POWERED TOOLS

Select an air powered tool and follow the procedure for the comparable electric powered tool. You should emphasize proper use of the selected tool and the specific safety precautions related to the use of compressed air as a power source.

SUGGESTED SAFETY TEST QUESTIONS

Questions in this section are provided for the teacher's use at his discretion. There are general safety questions pertaining to overall shop safety and specific questions concerning each tool covered in the student reference manual.

GENERAL SAFETY

1. The most frequent injuries occur to
   a. head
   b. eyes
   c. legs
   d. fingers

2. A cleaning agent no longer recommended for use in shops is
   a. kerosene
   b. carbon tetrachloride
   c. varosol
   d. all of the above

3. The following items should be removed when working in the shop
   a. rings and watches
   b. ties
   c. loose fitting sweaters
   d. all of the above

4. Fire equipment and emergency stops are identified by which of the following colors?
   a. blue
   b. green
   c. red
   d. yellow

5. First aid equipment is identified by which color?
   a. green
   b. yellow
   c. white
   d. blue

6. A fire containing wood, hay, paper or textiles is what class of fire?
   a. A
   b. B
   c. C
   d. none of the above

7. An electric fire is what class of fire?
   a. A
   b. B
   c. C
   d. none of the above

8. A soda acid fire extinguisher should be used on what class of fire?
   a. A
   b. B & C
   c. A & C
   d. all of the above

9. A carbon dioxide type fire extinguisher can be used on what class(es) of fire(s)?
   a. A & B
   b. A & C
   c. B & C
   d. A, B & C

10. All electrical appliances and extension cords should be
    a. 2 wire cable
    b. 3 wire cable parallel ground
    c. 4 wire cable
    d. any of the above

11. When lifting a weight, a person should
    a. bend over at the waist and pick it up
    b. bend the knees, keeping the back straight and pick it up
    c. either A or B
    d. none of the above

12. Shock can be caused by
    a. bad burns
    b. loss of blood
    c. broken bones
    d. all of the above

JOINTER

1. All adjustments on the jointer should be made
   a. while it is operating
   b. with the power off
   c. while using it
   d. all of the above

2. When using the jointer the hands should be
   a. placed directly over the cutter head
   b. on the rear of the stock behind the cutter head
   c. on top of the stock not hanging over
   d. none of the above

3. All stock should be jointed
   a. across the grain
   b. with the grain
   c. against the grain
   d. any of the above is correct

4. When jointing small or short work pieces
   a. hold them firmly with both hands
   b. remove the guard
   c. use a push stick or hold down block
   d. push it through rapidly

PLANER

1. When planing hard woods
   a. take deeper cuts
   b. take shallower cuts
   c. set up the speed of feed
   d. none of the above

2. Stock of different thicknesses should not be planed together because
   a. they may cause kick back
   b. it is all right, nothing will happen
   c. the machine will stall
   d. none of the above

3. You should never plane material which is thinner than
   a. 3/4"
   b. 1/2"
   c. 1/4"
   d. 1/8"

4. When preparing to run stock through for the second time, the stock should be
   a. passed over the planer
   b. passed around the planer
   c. passed under the planer
   d. any of the above

TABLE SAW

1. Always use a push stick when you are
   a. turning the switch on or off
   b. removing scrap from the saw table
   c. ripping short or narrow work pieces
   d. making adjustments

2. The saw blade should not project more than
   a. 1/4" above the work piece
   b. 1/2" above the work piece
   c. 3/4" above the work piece
   d. none of the above

3. When shutting off the saw, the saw blade
   a. should be stopped by forcing a piece of wood against it
   b. should be allowed to stop by itself
   c. either a or b above
   d. neither a nor b above

4. When ripping, the waste stock should be
   a. next to the ripping fence
   b. on the clear side of the blade
   c. either a or b above
   d. none of the above

RADIAL ARM SAW

1. Never rip material which is less than
   a. 6" long
   b. 12" long
   c. 18" long
   d. 24" long

2. When crosscutting stock, it
   a. should be held firmly against the fence
   b. should not be held firmly against the fence
   c. should be held away from the fence
   d. none of the above

3. When shutting off the radial arm saw
   a. wait until the blade stops before leaving the saw
   b. stop the blade with a piece of wood
   c. continue cutting until the blade stops
   d. none of the above

4. It is advisable to
   a. make adjustments with the saw running
   b. place fingers between the work and the fence
   c. set the saw blade so it will cut the table
   d. use a push stick when ripping narrow work pieces

BAND SAW

1. Adjust the upper blade guide and guard so that it will clear the work piece by
   a. 1/8"-1/4"
   b. 3/8"-1/2"
   c. 5/8"-3/4"
   d. it does not matter how much clearance you allow

2. You may back the saw blade out of the kerf
   a. with the blade running
   b. with the blade stopped
   c. while the blade is coasting to a stop
   d. none of the above

3. To stop the band saw
   a. jam the blade with scrap pieces
   b. pinch the blade in a sharp arc
   c. apply the brake gradually if so equipped
   d. none of the above

4. For close cutting work
   a. use your hands
   b. use a push stick
   c. either a or b above
   d. none of the above

JIG SAW

1. To remove chips and small blocks from the saw table
   a. use your fingers
   b. use a brush
   c. use a rag
   d. none of the above

2. Always adjust the hold down
   a. to the position used by the teacher
   b. up and out of the way
   c. so it just clears your work piece
   d. none of the above

3. A properly installed blade has the teeth pointed
   a. down
   b. up
   c. either up or down

4. When feeding your work piece into the jig saw
   a. feed it slowly and carefully
   b. maintain a firm grip for control
   c. keep your fingers out of the path of the blade
   d. all of the above

DRILL PRESS

1. The long end of a work piece should, whenever possible, be kept
   a. to your left
   b. to your right
   c. either left or right
   d. none of the above

2. After tightening a drill bit in the chuck
   a. remove the chuck key from the chuck
   b. leave the chuck key in the chuck
   c. none of the above

3. A work piece should be
   a. held in the hand
   b. held with pliers
   c. held firmly in a vise or clamp
   d. none of the above

4. When a work piece is caught and revolving with the drill bit
   a. catch it and stop it with your hand
   b. stop the drill and free the work piece
   c. step back; it will fall off eventually
   d. hit it with a hammer to break it loose

DISK SANDER

1. Always sand on the side of the disk which is rotating
   a. downward toward the table
   b. upward away from the table
   c. in the center
   d. any of the above would be correct

2. Hands should always be kept at least
   a. 1/2" from the disk
   b. 1" from the disk
   c. 2" from the disk
   d. 3" from the disk

3. Never use the sander
   a. to form objects which can be done better on other machines
   b. on surfaces with excess glue or finish
   c. if the abrasive disk is loose
   d. all of the above

4. When shutting off the sander
   a. allow the disk to stop before leaving the machine
   b. force a block against the disk to stop it
   c. slow the disk down with the hand
   d. either b or c

BELT SANDER

1. Small and irregular shaped pieces should be
   a. held firmly in the fingers
   b. held with the hand
   c. held in a jig or hand clamp
   d. all of the above

2. When sanding thin work pieces
   a. use a pad or push block
   b. hold firmly with the palm of the hand
   c. remove the table and guard
   d. none of the above

3. When sanding the end grain of wood
   a. hold it loosely away from the table
   b. support it against the table
   c. hold it against the idler pulley
   d. either a, b, or c is correct

4. When starting the belt sander
   a. wait until it reaches its rated speed before using
   b. check to be sure the belt tracks properly
   c. both a and b above
   d. neither a nor b

WOOD LATHE

1. When using lathe tools the operator should
   a. stand slightly to one side
   b. stand directly in line with the tool
   c. remove his safety glasses
   d. stand as far away as possible

2. The tool rest should be adjusted so that all cuts are made
   a. below center
   b. on center
   c. above center
   d. all of the above are correct

3. Lathe speed is dependent on
   a. diameter of stock
   b. length of stock
   c. shape of stock
   d. all of the above

4. When not in use, lathe tools should be
   a. stored in a cabinet
   b. kept in your pocket
   c. laid on the lathe ways
   d. thrown in a drawer

POWER HACKSAW

1. To prevent tooth breakage
   a. set the saw on the work before starting
   b. set the blade in motion before it comes in contact with the work
   c. hold the blade against the work while cutting
   d. none of the above

2. To clean chips from the saw
   a. stop the blade
   b. use your hands
   c. use a brush
   d. a and c above

3. The saw must be stopped before
   a. making adjustments
   b. cleaning up chips
   c. oiling the machine
   d. all of the above

4. The work pieces should
   a. be clamped firmly
   b. be held in the hand
   c. not be supported if very long
   d. all of the above

BENCH OR PEDESTAL GRINDER

1. The tool rest should be adjusted to within
   a. 1/2" of the stone
   b. 1/4" of the stone
   c. 1/8" of the stone
   d. any distance, it is not important

2. A stone should not be used when it has worn down to less than
   a. 1/4 of its original diameter
   b. 1/2 of its original diameter
   c. 3/4 of its original diameter
   d. 1/10 of its original diameter

3. When starting a grinder
   a. apply the work immediately
   b. wait until it reaches operating speed before using
   c. either a or b above
   d. neither a nor b above

4. When grinding small, round or odd shaped jobs
   a. hold them firmly in the fingers
   b. hold them loosely in the fingers
   c. use vise grips or pliers to hold them
   d. none of the above

ENGINE LATHE

1. When shutting off the lathe
   a. allow it to stop by itself
   b. slow it down with your hands
   c. use your cutting tool to slow it down
   d. all of the above

2. When putting a chuck or face plate on the lathe
   a. use the lathe power to put it on
   b. put it on by hand
   c. use wooden blocks to drive it on
   d. none of the above

3. All finish cuts near a shoulder, the face plate or chuck should be made using
   a. the hand feed
   b. the automatic feed
   c. at fast speeds
   d. none of the above

4. It is advisable to
   a. make adjustments while it is running
   b. use a file without a handle
   c. remove shavings and chips with the hand
   d. none of the above

OXYACETYLENE WELDER

1. The hoses for oxyacetylene welding equipment are color coded; the appropriate colors are
   a. red for exygen and green for acetylene
   b. green for oxygen and red for acetylene
   c. red for oxygen and blue for acetylene
   d. blue for oxygen and red for acetylene

2. When lighting the oxyacetylene torch you should use a
   a. match
   b. flint lighter
   c. cigarette lighter
   d. another oxyacetylene torch

3. Oxygen and acetylene tanks should be stored
   a. laying down so they won't fall over
   b. upright with the safety cap on
   c. in the welding area so they are handy
   d. none of the above

4. All hoses and connections should be checked for leaks
   a. daily
   b. weekly
   c. bi-weekly
   d. monthly

ELECTRIC ARC WELDER

1. Which of the following items of clothing are not recommended for wearing when doing electric arc welding?
   a. long sleeved shirt
   b. skull cap
   c. long pants with cuffs
   d. high top shoes

2. Electrode stubs should be discarded
   a. on the floor
   b. in a can
   c. in your pocket
   d. any of the above

3. If you experience an arc flash
   a. wash the eyes with water
   b. close your eyes and rest, then resume work
   c. report this to your instructor
   d. forget about it

4. When chipping slag
   a. wear safety glasses
   b. protect your eyes with your hand
   c. use a lift-front shield
   d. either a or c above

HYDRAULIC PRESS

1. When using the hydraulic press
   a. apply the pressure rapidly
   b. apply the pressure slowly
   c. position your work with pressure applied
   d. all of the above

2. When leaving the work area
   a. leave pressure on the work piece
   b. relieve all pressure
   c. either a or b
   d. none of the above

3. If after you begin to apply pressure the work piece slips or tips
   a. hold it with your hand and continue applying pressure
   b. relieve the pressure and straighten it up
   c. force it back under pressure
   d. none of the above

4. If more pressure is required than the safety valve will allow
   a. by-pass the safety valve
   b. take the safety valve off
   c. replace the safety valve with one of a larger capacity
   d. none of the above

JACKS

1. It is safe to work under an object
   a. supported only by the jack
   b. supported by the jack and jack stands or other supports
   c. either a or b
   d. neither a nor b

2. Always make
   a. sure the jack is capable of supporting the load
   b. sure the jack and the object will not be damaged
   c. adjustments when the load is raised
   d. a and b above

3. You should never
   a. leave a job supported only by a jack
   b. use extra supports to hold job up
   c. place footing supports under the jack
   d. all of the above

CHAIN HOIST

1. When moving an object with the chain hoist
   a. raise it as high as possible before moving
   b. get under it to help hold it up
   c. keep it as close to the floor as possible
   d. swing it because it will move easier

2. When lifting an object
   a. check connections as soon as weight is applied
   b. get under the object
   c. leave it suspended
   d. all of the above

STEAM CLEANER

1. The hose for the steam cleaner
   a. should be held by the insulated grip
   b. can be pointed at other people
   c. can be laid down while you do other work
   d. none of the above

2. When shutting off the steam cleaner
   a. Shut off the water first
   b. shut off the burner first
   c. unplug the electric power first
   d. a, b and c above can be done in any order

3. The safety blow out plug should always be pointed toward the
   a. right
   b. left
   c. floor
   d. ceiling

PORTABLE CIRCULAR SAW

1. The depth of cut should be adjusted to the thickness of the stock plus
   a. 1/16"
   b. 1/8"
   c. 1/4"
   d. 1/2"

2. When starting the saw the blade should
   a. not be in contact with the stock
   b. be in contact with the stock
   c. either a or b, it doesn't matter
   d. none of the above

3. When operating a portable circular saw you should
   a. never stand on a wet surface
   b. guide the saw with both hands
   c. check the power cord for condition and proper grounding
   d. all of the above

4. All adjustments should be made with
   a. the switch off
   b. the switch on
   c. the power source disconnected
   d. none of the above

PORTABLE SABER SAW

1. After the job is completed the saber saw should be
   a. put away with the blade in it
   b. put away with the blade removed
   c. laid off to one side
   d. none of the above

2. When using the saber saw the work pieces should be
   a. held in one hand
   b. secured firmly with vise or clamps
   c. held by another person
   d. all of the above

3. The saw motor should be started
   a. with the blade in contact with the work piece
   b. before the blade contacts the work piece
   c. before the saw is brought to the work piece
   d. none of the above

4. When sawing curved lines, the sharpness of the arc to be cut is limited by
   a. the strength of the operator
   b. the skill of the operator
   c. the width of the blade
   d. the length of the power cord

PORTABLE BELT SANDER

1. Applying excessive pressure to the belt sander can cause
   a. overheating of the motor
   b. loading of the belt
   c. a and b above
   d. none of the above

2. When using the portable belt sander your work piece should be
   a. held in one hand
   b. held in both hands
   c. secured firmly to the work table
   d. none of the above

3. The portable belt sander should be applied to the work
   a. as soon as it is started
   b. after the motor has reached its operating speed
   c. before the motor is started
   d. either a, b or c; it doesn't matter

4. The operator of the portable belt sander should stand
   a. to the right or left of the work piece
   b. directly behind the work piece
   c. either a or b
   d. neither a nor b

PORTABLE FINISHING SANDER

1. When replacing the abrasive pad the
   a. switch should be turned off
   b. power source must be disconnected
   c. either a or b; it doesn't matter
   d. none of the above

5734

2. When removing the sander from the work piece
   a. the sander motor should be stopped first
   b. the sander should be removed before the motor is stopped
   c. you should apply extra pressure as you shut off the motor
   d. none of the above

3. When using the portable finishing sander, small work pieces should be
   a. fastened securely to the work table
   b. held firmly in the hand
   c. held loosely in the hand
   d. held with pliers

4. When using the portable finishing sander you should
   a. never stand on a wet surface
   b. disconnect the power source before replacing the abrasive pad
   c. make adjustments with the power off
   d. all of the above

PORTABLE ROUTER

1. Before cleaning, oiling or replacing the cutter bit you should
   a. shut the switch off
   b. disconnect the power source
   c. either a or b
   d. neither a nor b

2. When using the portable router the work piece should be
   a. secured firmly in a vise or with clamps
   b. held firmly in one hand
   c. held loosely in one hand
   d. either a, b or c above

3. When finishing a job the router should be
   a. removed from the work piece before it is shut off
   b. shut off and immediately removed from the work piece
   c. shut off and removed from the work when the cutter stops rotating
   d. none of the above

4. The portable router should be held
   a. in the right hand
   b. in the left hand
   c. firmly in both hands
   d. any way you want

PORTABLE ELECTRIC DRILL

1. When using the electric drill you should never
   a. stand on a wet surface
   b. lock the switch in the on position
   c. hold the stock to be drilled in your hand
   d. all of the above

2. After inserting and tightening the drill bit, the chuck key should be
   a. removed from the chuck
   b. left in the chuck
   c. either a or b
   d. neither a nor b

3. When using the portable electric drill the operator should
   a. hold the drill in one hand
   b. steady the work piece with your free hand
   c. hold the drill firmly in both hands
   d. a and b above

4. When the job is completed the operator should
   a. wait until the drill stops before laying down the drill
   b. remove the bit before storing the drill
   c. both a and b
   d. neither a nor b

PORTABLE DISK SANDER, POLISHER AND GRINDER

1. After mounting a new wheel on the tool, the operator should
   a. start the grinder and begin work
   b. start the grinder and run it a few minutes to be sure the wheel is mounted properly
   c. hold the wheel against the work piece and start the grinder
   d. none of the above

2. When shutting off the grinder
   a. wait until the wheel stops before you set it down
   b. hold the wheel against the work piece to slow it down
   c. set the grinder on the edge of a bench so the wheel can run freely
   d. none of the above

3. The operator of a portable grinder should
   a. wear safety glasses
   b. check to see that no one will be hit by chips or sparks
   c. hold the grinder firmly in both hands
   d. all of the above

ELECTRIC IMPACT WRENCH

1. The socket should be applied to the nut or bolt head while it is
   a. rotating
   b. standing still
   c. either a or b
   d. neither a nor b

2. When using an electric impact wrench, the operator should
   a. never stand on a wet surface
   b. allow the wrench to stop before changing sockets
   c. hold the wrench firmly in both hands
   d. all of the above

3. The sockets to be used with the electric impact wrench are
   a. special type for the wrench
   b. regular sockets
   c. either a or b
   d. none of the above

PORTABLE AIR POWERED TOOLS

1. When using portable air powered tools the operator should
   a. be certain the pressure on the line does not exceed the manufacturers' specifications
   b. be certain the air hose is not kinked or in danger of being pinched or run over
   c. the air hose is in good condition and all connections are secure
   d. all of the above

APPENDIX

THE SOUTH CAROLINA EYE PROTECTION LAW

The following is a copy of the eye protection law:

(R545, H1314)

An Act To Require The Public Schools Of The State To Supply Plano Protective Eye Devices To Pupils And Teachers Participating In Certain Courses And To Require Pupils And Teachers Desiring Protective-Corrective Eye Devices To Secure Such Devices At Their Own Expense.

Be it enacted by the General Assembly of the State of South Carolina:

Section 1. Every pupil and teacher in any public school participating in any of the following courses:

(a) Vocational or industrial art shops or laboratories involving use of or exposure to:

(1) Hot molten metals
(2) Milling, sawing, turning, shaping, cutting, or stamping of any solid materials
(3) Heat treatment, tempering, or kiln firing of any metal or other materials
(4) Gas or electric arc welding
(5) Repair or servicing of any vehicle
(6) Caustic or explosive materials

(b) Chemical or combined chemical-physical laboratories involving caustic or explosive chemical or hot liquids or solids; is required to wear industrial quality eye protective devices at all times while participating in such courses or laboratories. The trustees of each school district shall purchase and cause such plano protective eye devices to be placed in such public schools for the eye protection of pupils, teachers, and visitors to such classrooms or laboratories.

(c) Any person desiring protective-corrective lenses instead of plano protective devices supplied by the school trustees shall at his own expense procure and equip himself with industrial quality eye protective devices secured from legally authorized dispensers.

The phrase "industrial quality eye protective devices", as used in this section, means devices meeting the standards of the American Standard Safety Code for Head, Eye, and Respiratory Protection, Z2.1-1959, promulgated by the American Standards Association, Incorporated.

Section 2. This act shall take effect upon approval by the Governor.

In the Senate House the 4th day of June

In the Year of Our Lord One Thousand Nine Hundred and Sixty-Five.

Edgar A. Brown
President Pro Tempore of the Senate

Solomon Blatt,
Speaker of the House of Representatives.

Approved the 8th day of June, 1965.

Robert E. McNair
Governor.

ABSTRACT - This book, individually authored in cooperation with Rutgers University, presents principles and related theory of an automotive air conditioning system. Intended for teacher and student use in vocational high school programs, the units of instruction include: (1) Basic Principles, (2) Special Tools and Equipment, (3) The Drive Belt, (4) The Electro-Magnetic Clutch, (5) The Compressor, (6) Service Valves, (7) Basic Service Procedures, (8) Compressor Crankshaft Seal Repair Procedures, (9) The Condenser, (10) The Receiver Drier, (11) Thermostatic-Expansion Valve Functions, (12) The Evaporator, (13) The Electrical Control System, (14) Testing, and (15) Tubing. The lessons are presented in outline form with numerous illustrations. A glossary and achievement tests are appended. (GB)

Grateful appreciation is expressed to the many people who have made work on this study guide possible through their wholehearted support and assistance. I am especially indebted to the members of the Board of Education, and to my Superintendent, Dr. Neal B. Perkins, Bergen County Vocational - Technical High School, for their sponsorship and encouragement.

My special gratitude is offered to the administration and members of the faculty of the Bergen County Vocational School System, namely: Mr. Albert Rachel, Principal; related teachers, Mr. W. Otten, Mr. C. Hanna, Mr.E. Sabol. Shop teachers; Mr. W. Koch, Mr. H. Mellon, Mr. J. Naturale, Mr. W. Fitzgerald. Their constructive criticisms, experience, and suggestions have proven invaluable.

John F. Carmody

To the Instructor:

CONTENT OF THE BOOK

The book contains units of instruction which:

1. Explain the basic principles and related theory of an automotive air conditioning system.

2. Identify the system components, and explain their operation.

3. Instruct the student - step by step - in repair and service procedures.

ARRANGEMENT

The material is arranged so that a sequential learning process may be established. The order of the units of instruction follows the flow of refrigerant in the system, and the related information precedes each component service procedure. Schematics and charts are used to increase the effectiveness of instruction.

This arrangement should prove helpful in an educational system where the shop instructor also teaches related theory, as he may turn the page and continue with shop operations. In an educational system using separate related classes, the teacher may turn a page and become familiar with the shop procedures the student will follow. Lessons are marked T (theory) and S (shop) for quick identification.

PARTS REQUIRED FOR INSTRUCTION

In order to perform service and repair procedures, it will be necessary for the instructor to furnish system components and spare parts. In some cases defective parts are required, such as a radiator cap or blower motor. The instructor may compile his own list of parts by glancing through the shop assignments at the end of each lesson or procedure.

Automobile Air Conditioning

5 Periodic Maintenance 137

GLOSSARY. 138

ACHIEVEMENT TESTS

UNIT I - BASIC PRINCIPLES

Lesson I — The Purpose of Automotive Air Conditioning

Objective: To learn how automotive air conditioning makes us feel more comfortable.

Automotive air conditioning is a process that cleans, cools, and circulates the air. It also reduces the air moisture content (humidity).

Normal body temperature is 98.6F. This temperature is created and maintained by food intake. As food is taken into the body, it is converted into energy. Since the body creates more heat than is needed, heat must constantly be given off. The rate of which heat is given off, is controlled by air temperature, air movement, and humidity.

In helping us control these three factors, automotive air conditioning makes the body feel more comfortable.

Assignment:

1. What does automotive air conditioning do?
2. What is normal body temperature?
3. How is normal body temperature maintained?
4. What factors control body heat dissipation?

UNIT I - BASIC PRINCIPLES

Lesson 2 — Convection

Objective: To learn the principle of convection, and its relation to body comfort.

Heated air expands and becomes less dense than the surrounding air. As air expands, it also rises and as a result cooler air is drawn up from below, replacing the heated air. This cycle is constantly repeated. The cycle is known as convection.

As the flow of air moves more rapidly, heat is dissipated at a faster rate. The body gives up heat through convection, as body heat travels to the surrounding air when the air temperature is less than the body skin temperature.

We have learned that *heat travels to a lower temperature and that warm air rises*. This movement of air cools the body.

Assignment:

1. Why does heated air expand?
2. Describe the flow of heated air.
3. How does air movement affect convection?
4. How does convection affect the body temperature?

UNIT I - BASIC PRINCIPLES

Lesson 3 — Evaporation

Objective: To learn the principle of evaporation, and its relation to body comfort.

Evaporation is a process in which moisture changes to a vapor. As moisture evaporates from a warm surface, a lot of heat is removed and a cooling effect is produced.

Moisture in the air is measured in terms of humidity. As an example, 50% relative humidity indicates that the air, in a specific location, contains one half the moisture that it is capable of holding, at a given temperature. The comfort range for the human body is approximately 70-80°F at 40-50% relative humidity. The drier the air (low humidity), the more moisture may be absorbed. The opposite is true of high humidity.

The body skin surface is constantly giving up moisture to the surrounding air in the form of perspiration. As this moisture evaporates, heat transfer takes place reducing body temperature.

Assignment:

1. What is humidity?
2. Describe the manner in which heat is given up by evaporation.
3. Why are we uncomfortable when the humidity is high?

UNIT I - BASIC PRINCIPLES

Lesson 4 — The Refrigerant - R12

Objective: To learn the requirements an automotive refrigerant must fulfill, and how R12 meets these requirements.

A refrigerant is needed in an automotive air conditioner to produce cooling. Cooling takes place by removing heat. A refrigerant chosen for this purpose must:

1. Stand high pressure without deteriorating.
2. Be non-inflammable.
3. Have low toxicity.
4. Absorb and convey heat.
5. Be non-corrosive to metals.
6. Be harmless to rubber.
7. Be compatible with petroleum oil.

R12 meets these requirements and is used in nearly all modern cars equipped with air conditioning.

R12 is produced from carbon tetrachloride. It is almost colorless, and has a slightly sweet odor. It is packaged in small cans by the pound, and also available in cylinders of up to 150 pounds.

Assignment:

True or false?

1. R12 cools because it is a "cold" liquid. ( )
2. R12 will not burn. ( )
3. R12 is harmless to the human body. ( )
4. R12 will not rust metal. ( )

UNIT I - BASIC PRINCIPLES

Lesson 5 — The Refrigeration Cycle

Objective: To learn the names of the components in a basic refrigeration cycle, and the refrigerant flow, of an automotive air conditioner.

Operation of the compressor draws the heated refrigerant from the evaporator, through the suction line, into the cylinder of the compressor. The compressor pushes the refrigerant, a high pressure gas, to the condensor through the high pressure line. The temperature of the gas entering the condensor is much higher than the air around it and heat is transferred to the outside air which circulates through the condensor fins. As this process takes place, the high pressure gas condenses into a liquid, and is sent to the receiver drier.

The flow of liquid refrigerant is then controlled by the thermostat expansion valve, which meters the proper amount of refrigerant into the evaporator. At the valve exit the pressure is reduced. As the liquid refrigerant absorbs heat, in the evaporator, it boils and changes into a low pressure gas. The gas is then drawn to the compressor, and the cycle begins again.

Assignment:

1. Begin with the compressor, and name the components of a basic automotive air conditioner.

2. Draw a diagram showing the flow of refrigerant.

3. Why does the refrigerant boil when the pressure is reduced?

UNIT I - BASIC PRINCIPLES

Lesson 6 — Safety

Objective: To learn safety procedures pertinent to automotive air conditioning. Care in disconnecting components of the system, and proper work habits.

General: It is recommended that the work habits and safety precautions as listed below be followed when servicing the system. They are listed in a group to avoid needless repetition with each shop procedure.

Always wear safety goggles

1. Before disconnecting any component of the system, the system must *first be discharged.*

2. When discharging the system open the connection, with caution, and *be alert to pressure trapped in the system.*

3. If pressure is present, allow it to *bleed off slowly.* After disconnecting a component, immediately *cap all lines or connections* to prevent the entrance of dirt or moisture.

4. When discharging the system *wrap a clean cloth around the discharge hose.* The precence of oil on the cloth indicates the system is *loosing oil and being discharged too fast.*

5. *Never* discharge the system in a confined area.

6. *Never* discharge the system near an open flame.

7. Where possible, *discharge the system into the building exhaust system.*

8. When charging the system *never invert the refrigerant container.* If a slug of liquid refrigerant enters the compressor, the compressor will be damaged.

9. When charging the system, *never place the container of refrigerant on the car radiator.*

10. When charging the system *do not allow the container of refrigerant to tip over.*

11. When charging the system *proceed slowly and watch system pressures.* If the high gauge exceeds 240 lbs. *stop charging and determine the cause.* System blockage may exist and result in dangerously high pressures.

12. When charging the system on a hot day it may be wise to *place a portable fan in front of the condenser* to simulate ram air-flow.

13. When charging the system add the recommended amount of refrigerant *as specified by the manufacturers. Never guess or overcharge.*

14. When a compressor is removed for repair or replacement, always drain the oil into a graduated container and *record the amount of oil drained.*

15. When adding oil to the compressor, *use the viscosity recommended by the manufacturer.*

16. The use of proper tools is very important. *Work with two or three wrenches* where needed, and "back-up" the line or connection to prevent the line from twisting, kinking, or breaking.

17. *Use flare wrenches* on line nuts and loosen carefully.

18. Tighten all connections to the *specified torque.*

19. *Use a service valve wrench only,* when opening or closing service valves.

20. *Have all required tools ready* before starting to service the system.

21. *Lubricate all threads and fittings with refrigeration oil* when assembling connections.

22. *Lubricate* all O rings and copper gaskets where applicable with *refrigeration oil.*

23. Never bend a flexible hose *less than ten times the diameter of the hose.*

24. Always locate hoses and lines *as far from the exhaust manifolds as possible.*

25. Keep hoses and lines mounted securely *to eliminate vibration.*

Assignment:

Study this lesson and write a 500 word composition about safety.

UNIT II - SPECIAL TOOLS AND EQUIPMENT

Lesson I

Objective: To learn the kind of tools and equipment needed to service an automotive air conditioner.

The tools and equipment shown are recommended by General Motors. They are required in order to properly service factory installations.

5766

Air Conditioning Special Tools

1. J-5725-A Gauge Manifold Test Unit
2. J-5453 Goggles
3. J-5418 Gauge Charging Lines (5)
4. J-5462-1 2-Way Valve
5. J-5462-3 Refrigerant Drum Washer
6. J-5462-2 3-Way "T"
7. J-5462-4 Refrigerant Drum Reducer
8. J-5462-7 Female Connection
9. J-5462-8 Ring Seat
10. J-5462-9 Pipe Fitting (1/4" x 1/4")
11. J-9459 90° Gauge Line Adapter
12. J-5420 Gauge Line Adapter
13. J-5428 Vacuum Pump
14. J-6084 Leak Detector
15. J-8433 Puller
16. J-9395 Puller Pilot
17. J-6272 Multi-Opener (4 Can)
18. J-6271 Fitzall Valve (Single Can)
19. J-7151 Non-Magnetic Clutch Shims
20. J-5421 Pocket Thermometers (2)
21. J-5403 #21 Snap Ring Pliers
22. J-6435 #26 Snap Ring Pliers
23. J-9396 Compressor Holding Fixture
24. J-9397 Compressing Fixture
25. J-9403 Clutch Hub Holding Tool
26. J-9399 9/16" Thin Wall Socket
27. J-9401 Hub and Drive Plate Assembly Remover
28. J-9480 Hub and Drive Plate Assembly Installer
29. J-9392 Seal Remover
30. J-9393 Seal Seat Remover
31. J-9398 Pulley Bearing Remover
32. J-9481 Pulley and Bearing Installer
33. J-8092 Handle
34. J-9521 Internal Assembly Support Block
35. J-5139 Oil Pickup Tube Remover
36. J-9432 Needle Bearing Installer
37. J-9553 Seal Seat "O" Ring Remover
38. J-21508 Seal Seat "O" Ring Installer
39. J-21303 Shaft Seal Protector
40. J-9527 Pressure Test Connector
41. J-9402 Parts Tray

In addition, the mechanic will need tools and equipment as listed below:

Ammeter
Tachometer
Test lamp
Jumper leads
Remote control
Pressure tester for radiator caps
Tubing benders
Tubing cutter
Flaring tool kit
Flare wrenches
Mechanic's tool kit
Graduated container (ounces)

UNIT III - THE DRIVE BELT

Lesson I — Function in the System

Objective: To learn the purpose of the drive belt, and the importance of inspection and adjustment.

The drive belt is used to drive the compressor. It is driven by the engine crankshaft, which is connected with an electro-magnetic clutch.

Smaller type compressors usually use an idler pulley for the purpose of adjustment and belt location. Larger compressors have two belts, and adjustment is provided at the compressor mounting plate.

Drive belts should be inspected periodically, and replaced if they show signs of deterioration. Where two belts are used, they should be replaced in pairs, as they are manufactured in matched sets.

Belt adjustment is very important and should be performed with the use of a gauge, as shown in the diagram.

A loose belt will slip and decrease compressor efficiency. A tight belt will overload the clutch and compressor shaft bearings, causing premature bearing failure.

Assignment:

1. Why is an idler pulley used?

2. What would happen if one belt was replaced on a two-belt compressor?

3. How could you inspect the belt thoroughly?

4. What do you think is meant by the statement "decrease compressor efficiency"?

UNIT IV - THE ELECTRO-MAGNETIC CLUTCH

Lesson I — Function in the System

Objective: To learn what the electro-magnetic clutch does, and how it operates.

Nearly all cars equipped with air-conditioning use an electro-magnetic clutch to drive the compressor. The clutch operates by the principle of magnetic attraction.

Basically, the clutch consists of a bearing pressed into a hub, a pulley, a friction disc, and a field coil.

Operation of the clutch is as follows:

Driven by a belt, while the engine is running, the pulley free-wheels and spins on the bearing. When the field coil is energized, magnetic attraction connects the pulley to the friction disc. The clutch then spins as a unit, driving the compressor crankshaft. This action starts the refrigeration cycle.

Assignment:

1. What does the electro-magnetic clutch do?
2. What force engages the electro-magnetic clutch?
3. Under what condition would the electro-magnetic clutch "free-wheel?"
4. How is the field coil energized?

UNIT IV - THE ELECTRO-MAGNETIC CLUTCH

Lesson 2 How to Test the Clutch

Tools needed: Ammeter, remote control, test lamp.

In the event of a complaint of insufficient or no cooling, test the clutch in the following manner:

TEST FOR CURRENT TO THE CLUTCH

1. Disconnect the clutch field lead at the bullet connector. Connect the test lamp to the lead from the control switch and ground the test lamp.

2. Turn the ignition switch and the control switch on. The test lamp should light.

   If the lamp does not light, the trouble lies before the clutch. Check for: blown fuse, defective control switch(es), wiring to the clutch.

TEST CLUTCH FIELD CURRENT DRAW

1. Connect the ammeter in series with the clutch. Connect the negative lead of the ammeter to the clutch field lead. Connect the positive lead of the ammeter to the positive post of the battery. The clutch should engage with a sharp click.

2. The ammeter will indicate the field current draw. Compare the draw to specifications as shown:

Car manufacturer	Field current draw. Amperes at 12 volts.
Ford	2
Chrysler	2.5 to 3.3
General Motors	2.7 to 3.3
American Motors	2.5 to 2.9

An ammeter reading of zero indicates an open field circuit.

A lower ammeter reading indicates resistance in the field circuit.

A higher ammeter reading indicates a shorted field winding.

Assignment:

1. Use the test lamp and make an electrical continuity test to the clutch. Ask your instructor to help you.

2. Connect an ammeter in series to the clutch and record the field current draw.

3. State the reason why a clutch, known to be good, could not function with current supplied to the field.

4. What could cause resistance in the field circuit?

UNIT IV - THE ELECTRO-MAGNETIC CLUTCH

Lesson 3 How to Remove the Clutch

Tools required: Hub and drive plate puller, support bracket, drive plate holding tool, pulley puller, puller pilot, thin wall 9/16" socket, 5/8" National Coarse capscrew, tool kit.

To remove the clutch proceed as follows:

GENERAL MOTORS SIX CYLINDER

Note: It is not necessary to discharge the system or to remove the compressor when performing this service. The compressor is shown off the car for purposes of illustration.

REMOVE HUB AND DRIVE PLATE

1. Place the support bracket in a vise and mount the compressor to the bracket.

Removing Shaft Locknut

2. Hold the drive plate with the holding tool, as shown, and remove the shaft locknut. Discard the locknut.

3. Install the hub puller and remove the hub and drive-plate assembly.

Removing Hub and Drive Plate Assembly

REMOVE THE PULLEY AND BEARING ASSEMBLY

1. Remove the pulley and bearing retaining ring.

Removing Pulley and Bearing Assembly Retainer Ring

2. Remove the shaft key.

3. Install the puller pilot on the compressor shaft, and use the pulley puller to remove the pulley and bearing assembly.

Removing Pulley

REMOVE THE COIL HOUSING

1. Scribe the coil housing to the compressor case to be sure that the terminals will be reassembled in the proper position.

2. Remove the coil housing retainer ring.

Removing Coil Housing Retainer Ring

3. Remove the coil housing assembly.

York and Tecumseh

1. Remove the driving belts and disconnect the field lead at the bullet connector.

2. Remove the clutch retaining bolt and screw a 5/8" National Coarse capscrew into the hub.

3. Tighten the capscrew against the compressor crankshaft. The clutch assembly will loosen and may be removed.

4. Remove four ¼" machine screws and remove the clutch field from the compressor.

Chrysler Corporation

Follow the procedure outlined above with these exceptions:

1. Caution: The hub may be threaded National Coarse or National Fine. Use the proper capscrew or cross threading will result.

2. The clutch field is retained with three ¼" capscrews.

5776

UNIT IV - THE ELECTRO-MAGNETIC CLUTCH

Lesson 4 How to Install the Clutch

Tools needed: Hub installer, drive plate holding tool, support bracket, tool kit.

To install the clutch:

General Motors six cylinder

INSTALL THE COIL HOUSING

1. Position the coil housing to the compressor case and align the scribe marks.

Installing Coil Housing

2. Install the coil housing retainer ring, with the flat side of the ring facing the coil housing.

INSTALL THE PULLEY AND BEARING ASSEMBLY

1. Press the pulley and bearing assembly onto the neck of the compressor. *Check that the pulley will rotate freely.*

2. Install the pulley and bearing retainer ring.

3. Install the shaft key.

   Note: *Align the key with the shaft and allow it to extend 3/16" out of the end of the keyway.*

Drive Plate Key Installed in Keyway

INSTALL THE HUB AND DRIVE PLATE

1. Align the hub with the shaft key. Use the hub installer to tighten the assembly on the shaft until there is a 3/32" space between the frictional surfaces of the drive plate and the pulley.

   Note: Hold the hub with the drive plate holding tool and tighten the assembly, slowly and carefully.

Installing Hub and Drive Plate Assembly

2. Install the spacer and retainer ring.

   Note: The convex side of the retainer ring must face the spacer.

3. Install a new locknut and torque it 14-16 ft. lbs.

   Note: The notch on the locknut must face towards the retainer ring.

4. Check the air gap between the frictional surfaces. Gap should be .022 to .057, or 1/32" to 1/16".

Installing Drive Plate Assembly

Caution: Do not pound or drive the hub and drive plate onto the shaft. Major internal damage to the compressor will result.

York and Tecumsek

INSTALL THE CLUTCH FIELD

1. Attach the clutch field to the compressor with four ¼" machine screws.

   Caution: Tighten the screws uniformly to avoid distorting the assembly. Torque screws 4 to 7 ft. lbs.

INSTALL THE CLUTCH

1. Wipe the compressor shaft clean.

2. Inspect the position of the Woodruff key. The key must be fully seated in the shaft and tightly fit. The key must also be parallel to the taper of the shaft.

3. Assemble the clutch onto the compressor shaft.

   Caution: Be sure the clutch hub keyway is aligned with the Woodruff key.

4. Lock the clutch onto the shaft with a 5/16" capscrew.

   Caution: Do not hammer the clutch onto the shaft as the clutch will be damaged.

5. Spin the clutch to be sure there is no interference with the field.

6. Energize the field wire and check clutch engagement. The clutch should engage and disengage with a sharp click. Connect the field lead at the bullet connector.

Chrysler

Follow the procedure outlined above with the following exceptions:

1. When installing the clutch field, be sure the lead wire points up and is routed between the compressor cylinder head.

2. Tighten the three field mounting screws to 17" lbs.

3. Assemble the clutch to the compressor shaft using a new self-locking bolt. Torque the bolt to 20 ft. lbs.

UNIT IV - THE ELECTRO-MAGNETIC CLUTCH

Lesson 5 — How to Replace the Clutch Bearing (Stationary Field Type)

Tools needed: Arbor or hydraulic press, hub puller, bearing tool adaptor and support plate, tool kit, 5/8" N.C. and N. F. bolts.

Parts needed: Clutch bearing

To replace the clutch bearing, remove the clutch from the compressor crankshaft and proceed as follows:

Magnetic Clutch—Stationary Field Type

DISASSEMBLY

1. Remove the small snap ring from the drive hub.

2. Install the hub puller. Tighten the hex head bolt until the drive hub is removed from the bearing.

Removing the Hub and Shoe Assembly

3. Remove the bearing snap ring from the pulley assembly.

4. Place the pulley assembly on the press, with the pulley side down, and center the bearing hub on the support plate.

5. Install the bearing adaptor and press the bearing from the pulley assembly.

   Note: Whenever a bearing is pressed from the pulley assembly, a new bearing must be installed. The old bearing cannot be reused.

Removing the Bearing from the Pulley Assembly

ASSEMBLY

1. Place the pulley assembly, with the pulley side up, on the press, and insert a new bearing into the bore. Install the bearing adaptor on the bearing and press the bearing into the pulley assembly.

Installing a New Bearing in the Pulley Assembly

5784

2. Install the pulley assembly on the support plate, with pulley side facing down.

3. Start the drive hub into the inner bearing race and press the hub into position with the press.

4. Install the bearing snap ring and the hub snap ring.

   Install the clutch on the compressor crankshaft, and tighten the clutch with a new bolt.

   Note: The pulley assembly and the hub assembly are matched parts. Do not replace either unit separately.

Assignment:

1. Remove the clutch and disassemble the drive hub.

2. Ask your instructor to watch as you remove the clutch bearing.

3. Name the parts of the clutch.

4. Assemble the clutch and replace it on the compressor.

UNIT V - THE COMPRESSOR

Lesson I — The Function of the Compressor

Objective: To learn why a compressor is used in an automotive air conditioning system, and what it does.

The purpose of the compressor is to pump the refrigerant into the condensor.

Operating Cycle of Reciprocating Compressor

The refrigerant enters the compressor as a low pressure gas, and leaves the compressor as a high pressure gas.

Each cylinder in the compressor has a suction valve and a discharge valve. As the piston in the cylinder travels downward, a low pressure area is created in the cylinder. Pressure in the suction line opens the suction valve, causing *low pressure gas* to enter the cylinder.

As the piston travels upward, the low pressure gas is compressed to a higher pressure, and temperature. This pressure closes the suction valve and opens the discarge valve causing *high pressure gas* to leave the cylinder.

Assignment:

1. What does a compressor do?

2. What is the state of the refrigerant as it enters the compressor?

3. What is the state of the refrigerant as it leaves the compressor?

5787

UNIT V - THE COMPRESSOR

Lesson 2 — Types of Compressors

Objective: To learn the types of compressors used in cars equipped with air conditioning, and the names of the principal manufacturers

Nearly all cars equipped with air conditioning use reciprocating compressors. By reciprocating, we mean straight-line-travel. As applied to a compressor, this term refers to the up and down travel of the piston in the cylinder.

The principal manufacturers of compressors are General Motors Corporation; Chyrsler Corporation; York, and Tecumsek Manufacturing Companies. General Motors manufactures five or six cylinder compressors, and the other companies manufacture a two cylinder model.

Typical Two Cylinder "in line" compressor

York Manufacturing Co.
Tecumsek Manufacturing Co.

Chrysler Corporation Two Cylinder "V" Type Design

UNIT VI - SERVICE VALVES

Lesson I — Function in the System

Objective: To learn the need for service valves, and types of service valves in an air conditioning system.

All compressors are equipped with service valves. They are needed to perform the following service functions:

1. Discharge
2. Evacuate
3. Charge
4. Test

Opening Service Valve and Gauge Ports

The diagram shows service valves connected for charging the system. The compressor is a Chrysler Corporation "V" type design. Notice that Chrysler uses three service valves.

General Motors Corporation Six Cylinder Compressor

Assignment:

1. What does the term reciprocating mean?

2. How many cylinders are there in a York Compressor?

3. What is the difference between an "in line" and a "V" type compressor?

Adding Partial Refrigerant Charge

One valve is mounted at the outlet of the compressor and permits access to the high pressure side of the system. The other valve is mounted at the inlet side and permits access to the low pressure side.

There are two types of service valves; hand shut-off type, and Schrader type. A description of each follows:

HAND SHUT VALVES

This valve is a three position valve. It may be:

1. Front-seated. Refrigerant flow is shut off.

2. Back-seated. Refrigerant flow takes place.

3. Mid-positioned (cracked). In this position refrigerant flow takes

place, and pressure is indicated on the gauge.

Note: In position one and two the gauge part is closed and pressure cannot be indicated on the gauge.

A special wrench is needed to open and close the valve.

Service valve ratchet wrench

Hand shut-off type service valve

SCHRADER VALVE

This valve is a two-position valve. It may be:

1. Back-seated. This is its normal position; refrigerant flow takes place.

2. Cracked. In this position refrigerant flow takes place, and the gauge port is open. Pressure is indicated on the gauge.

Note: With the Schrader valve, refrigerant flow cannot be shut off.

COMPRESSOR VALVE Schrader

The valve contains a stem pin, which when depressed by an adaptor connected to the hose of the manifold gauge set, connects the system to the gauge.

Inserts seal connections

Both types of valves are equipped with protection caps to seal out dirt and moisture.

Assignment:

1. What is the purpose of a service valve?

2. Where are service valves located?

3. Describe the positions of a hand shut-off type service valve, and describe the refrigerant flow for each position.

4. Is there an advantage to the hand shut-off type valve?

5. Is there a disadvantage to the hand shut-off type valve?

6. Describe the positions of a Schrader valve, and refrigerant flow for each position.

7. Is there an advantage to the Schrader type valve?

8. Is there a disadvantage to the Schrader type valve?

UNIT VI - SERVICE VALVES

Lesson 2 — The Gauge Manifold Set

Objective: To learn the need and purpose of the gauge manifold set, and the method of connecting it to the air conditioning system.

A gauge manifold set is needed in order to test, service, or repair an automatic air conditioning system. A description of the gauge manifold set and connection to the system follows:

Pressure Gauge Set

THE LOW PRESSURE GAUGE

This gauge is a compound gauge; it will indicate either pressure or vacuum. Pressure readings up to 150 lbs., and vacuum 0 to 30 inches are recorded on the gauge. This gauge is always connected to the suction side of the system, the low pressure side. It may be connected to the suction service valve at the compressor, or to a suction pressure control device in the line before the compressor.

THE HIGH PRESSURE GAUGE

The high pressure gauge indicates pressures up to 500 lbs. and is always connected to the discharge service valve at the compressor. This is the high pressure side of the system.

THE MANIFOLD

The gauge manifold is a mounting fixture. It is equipped with a hand shut-off valve for each gauge. The manifold contains internal passages which are connected to the valves, and also to a common inlet-outlet port. The inlet port is used for purging, evacuating, and charging the system.

The manifold has threaded fittings, to which hoses approximately three feet long are attached. Where the hoses are connected to the service valves, the gauge manifold is said to be "connected into the system."

Assignment:

1. What is the purpose of the gauge manifold?

2. Where would you connect the compound gauge?

3. Where would you connect the high pressure gauge?

4. Connect the gauge manifold to the air conditioning system.

UNIT VI - SERVICE VALVES

Lesson 3 — How to Connect the Gauge Manifold to the Service Valves

Tools needed: Gauge manifold, service valve wrench, tool kit.

To connect the gauge manifold proceed as follows:

HAND SHUT-OFF TYPE

1. Remove the protective caps from the service valves.

   Caution: Remove the caps slowly and be alert to a hissing sound. If the valve is defective refrigerant may escape and could be pressurized. Close gauge manifold valves.

2. Connect the high pressure gauge manifold hose to the discharge service valve of the compressor.

3. Connect the low pressure gauge manifold hose to the suction service valve of the compressor.

   Note: Connect both hoses hand-tight. Service valves are marked "suction" and "discharge."

4. Mid-position both service valves by turning several turns in a clockwise direction.

5. Open the high pressure gauge manifold valve, momentarily, to purge the air from the high pressure hose. Close the valve.

6. Repeat and purge air from the low pressure hose. The gauge manifold set is now connected to the system.

SCHRADER TYPE

1. Remove the protective caps from the service valves.

   Caution: Remove the cap slowly in event the valve is defective.

2. Close the gauge manifold hand valves.

   Note: In order to connect the manifold hoses to the service valves it is necessary to attach an adaptor as shown.

3. Connect the high pressure gauge manifold hose to the discharge service valve of the compressor.

4. Connect the low pressure gauge manifold hose to the suction service valve of the compressor.

   Note: Connect both hoses hand tight.

5. Open the high pressure gauge manifold valve, momentarily, to purge the air from the high pressure hose. Close the valve.

6. Repeat and purge the air from the low pressure hose.

   The gauge manifold is now connected to the system.

Assignment:

1. State two important cautions that must be observed when connecting the gauge manifold.

2. What might happen if air was not purged from the hoses?

3. State the step that must be performed in order to obtain a reading on the gauges when working with hand shut-off type service valves.

4. Connect the gauge manifold hoses to each type of service valve. Use an air gun and blow through the valve. Ask your instructor to explain the circuits.

UNIT VI - SERVICE VALVES

Lesson 4 — How to Connect a One Pound Can of R-12 to the Gauge Manifold

Tools needed: Gauge manifold can tap

Material needed: One pound can of R-12

Note: The one pound can of R-12 has become more popular when charging the system, because its use makes it simpler to calculate exactly how much refrigerant has been added. This eliminates the need for a scale and the weighing of larger containers. Can fixtures are available that connect three or four cans to the charging hose and ease charging.

Disposable Cans and Valves

A special valve is required to connect the one pound can to the fixture, or to the center charging hose. This valve is known as a "can tap." To connect a one pound can of R-12 proceed as follows:

CONNECT THE VALVE TO THE ONE POUND CAN

1. Open the valve by turning it to the full counterclockwise position.

2. Connect the valve to the can.

   Caution: Be sure that the valve-to-can gasket is in place, and in good condition.

3. Connect the center charging hose to the valve.

CONNECT CHARGING LINE TO GAUGE MANIFOLD SET AND PIERCE CAN

1. Connect the center charging hose to the gauge manifold. Close both high and low pressure gauge manifold valves.

2. Turn the can tap valve to the full clockwise position. This will pierce the can and close the valve.

PRESSURIZE CHARGING LINE AND PURGE

1. Open the valve at the one pound can by turning to the full counter-clockwise position. The charging line is now pressurized.

2. Momentarily open and close the charging line at the gauge manifold. This will purge air from the charging line.

The one pound can is now connected and prepared for charging.

Assignment:

1. Connect a can tap to a used one pound can of R-12.

2. Practice opening and closing the valve.

3. Why must the gauge manifold valves be closed before opening the can tap valve?

4. Practice purging air from the center charging hose.

UNIT VII - BASIC SERVICE PROCEDURES

The services and procedures contained in this unit of instruction are those services that are most commonly performed. They are included at this point because most of the service procedures described in subsequent units of instruction require their understanding. In this way repetition is avoided.

UNIT VII - BASIC SERVICE PROCEDURES

Lesson I How to Discharge the System

Tools needed: Gauge manifold, service valve wrench, tool kit

Whenever any repair or replacement of components in the system is required, it is necessary to discharge the system. Proceed as follows:

1. Close the gauge manifold hand valves. Connect the gauge manifold to the compressor service valves. If the service valves are the hand shut-off type, turn to the mid-position.

2. Connect the center discharge hose to the manifold outlet. Direct the discharge hose to the building ventilation system or to the atmosphere.

   Caution: Do not discharge refrigerant into a confined area or near an open flame.

3. Start the engine and adjust the idling to 1500 R.P.M. Adjust the air-condition controls for maximum cooling and operate the system for fifteen minutes.

4. Allow the engine to idle for several minutes and turn the engine off.

5. Slowly open the gauge manifold hand valves and allow the refrigerant to bleed off. Continue bleeding until both gauges read zero.

6. Close the gauge manifold hand valves. Disconnect the gauge manifold from the compressor service valves.

   The system is now discharged and components may be removed or disconnected.

Assignment:

1. Refer to step 1. Why do we close both gauge manifold hand valves?

2. What might happen if we did not close the valves?

3. Why must the bleeding operation be performed slowly?

4. What is the next step to perform when a system component is disconnected?

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 2 System Evacuation

Objective: To learn the reasons why an automotive air conditioning system should be evacuated, and the purpose of a vacuum pump.

Whenever a component of an automotive air conditioning system containing refrigerant is disconnected and opened to the atmosphere, air and moisture will enter the system. It is of the most critical importance that the air and moisture be removed, to permit the system to function efficiently, and to prevent damage.

Note: The need for evacuation has no bearing on the length of time that the system was open.

Air must be removed, as its presence in the system will reduce the condenser's ability to condense the refrigerant gas and supply liquid refrigerant to the receiver drier. Air is a common cause for a loss of cooling efficiency.

Moisture will cause sticking of the thermostat expansion valve and irregular cooling. It will cause sludge which will damage the compressor. Moisture will also cause corrosion of the tubes in the evaporator and the condenser.

Note: Do not add alcohol or methanol to the system to prevent freezing of moisture. If these chemicals are added, the drier section of the receiver drier will release the moisture it has accumulated, and absorb the chemical. This will result in more moisture in the system.

The evacuation of air and moisture is accomplished by the use of a vacuum pump. In order to understand how this is done, it is first necessary to learn the relation of pressure to the boiling point of water.

The boiling point of water at sea level is 212°F. Atmospheric pressure at sea level is 14.7 P.S.I.

If this pressure is increased, the boiling point of water is increased.

If this pressure is lowered, the boiling point of water is lowered.

Vacuum is a term used to describe a pressure that is less than atmospheric pressure. This pressure is measured in inches of mercury, and designated by the symbol H.G. Example: 21^{HG} - or 21 inches of vacuum.

When a vacuum pump is connected to the system, the pressure in the system is lowered, moisture then boils and changes to a vapor which is collected by the vacuum pump.

A vacuum pump should be efficient enough to create at least 28 HG, and more desirable 29 - 30 HG. However, the higher values are possible only at sea level.

Water will boil under a vacuum at the temperature shown:

Vacuum	Degrees Fahrenheit
28. HG	100°
28.50 HG	90°
29. HG	75°
30. HG	- 25°

For each 1000 feet above sea level the specification should be lowered by 1 HG.

Assignment:

1. Would an air conditioning system have to be evacuated if it were open for five seconds?

2. Why does air in the system reduce condensation of the refrigerant gas?

3. Which situation is the most dangerous?

   a. Corrosion of the tubes in the condenser.

   b. Corrosion of the tubes in the evaporator.

4. Why is the boiling point of water highest at sea level?

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963-A

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 3 How to Evacuate the System

Tools needed: Vacuum pump, service valve wrench, gauge manifold, can tap.

Material needed: R-12

To evacuate the system proceed as follows:

CONNECT VACUUM PUMP AND GAUGE MANIFOLD

1. Connect the gauge manifold to compressor service valves.
2. Turn both service valves to the mid-position.
3. Turn both gauge manifold valves to the closed position.
4. Remove the protective caps from the inlet and exhaust parts of the vacuum pump.
5. Connect the center manifold hose to the inlet of the vacuum pump.

EVACUATE THE SYSTEM

1. Open both gauge manifold valves and start the vacuum pump.

2. Operate the vacuum pump at least thirty minutes. Close both gauge manifold valves and stop the vacuum pump. The low-pressure gauge should indicate at least 28 HG.

3. Disconnect the center manifold hose from the vacuum pump and connect the hose to a 1 lb. can of R-12. Open the valve at the can tap.

4. Momentarily open and close the center manifold hose at the gauge manifold to purge air from the hose.

5. Open the high-pressure-gauge manifold valve and allow the refrigerant to enter the system until a pressure of 5 PSI is indicated on the low-pressure gauge. Close the high-pressure-gauge manifold valve. Close the valve at the refrigerant can tap and disconnect the hose from the can tap.

6. Connect the center manifold hose to the inlet of the vacuum pump and repeat steps 1 and 2.

   Note: This double evacuation is necessary to assure complete removal of air and moisture.

7. Close both service valves at the compressor and gauge manifold valves.

SYSTEM IS NOW EVACUATED AND PREPARED FOR CHARGING

Assignment:

1. Why are both service valves set at the mid-position?

2. What trouble might be indicated if the low-pressure gauge did not indicate 28 HG?

3. Connect the vacuum pump and gauge manifold to the service valves. Your instructor will help you evacuate the system.

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 4 The Propane Gas Leak Detector

Objective: To teach the student the purpose of a leak detector and to describe how a leak detector functions.

The propane leak detector is a propane gas burning torch. It is used to locate refrigerant leaks in an air conditioning system.

The leak detector consists of a propane gas cylinder equipped with a hand shut-off valve, a burner head containing a reactor plate, and a sampling tube.

Leak Detector

Refrigerant gas drawn through the search hose will cause the flame in the burner head to vary in color in proportion to the size of the leak. A very small leak will produce a flame color of yellow-green to bright green. A larger leak will produce a brilliant blue flame.

The leak detector requires little service. When the gas cylinder is exhausted, a new cylinder may be screwed on the valve assembly. The plate may be cleaned periodically and is replaceable. It also may be tested for sensitivity. To test the reactor plate, light the torch

and hold the sampling tube under a compressor service valve. Crack the valve open and close it quickly. If the color of the flame does not change, clean or replace the reactor plate.

Assignment:

1. Name the parts of the leak detector.

2. What does the sampling tube do?

3. What color is produced by a large leak?

4. What other method might be used to test the reactor plate?

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 5 — How to Test the System for Leaks

Equipment needed: Leak detector, gauge manifold

Material needed: R-12

Caution: Never use the leak detector where a large concentration of refrigerant vapor is known to exist. When refrigerant vapor is exposed to an open flame, Phosgene, a poisonous gas is formed. This gas should never be inhaled.

Before testing the system for leaks it is necessary to check the system pressure. Proceed as follows:

NORMALIZE SYSTEM AND CHECK PRESSURE

1. Start the engine and run it at a fast idle. Adjust the controls for maximum cooling and operate the system for ten minutes.

2. Install the gauge manifold and determine system pressures.

3. Compare pressures with specifications. If pressures are low add a partial charge.

4. Turn the engine and air conditioner off.

   In event the system was serviced, or a leak repaired, use a portable fan to remove vapors from the engine compartment and dash area.

TEST SYSTEM FOR LEAKS

1. Open the leak detector valve and light the torch. Adjust the valve to obtain a small flame.

   Note: A small flame will detect a small leak, a large flame may not.

2. Allow the torch to burn until the reaction plate becomes red hot. The leak dectector is now ready for use.

3. Test all connections, hoses, compressor seals, and system components by placing the sampling tube on, over, and under the possible leak point.

Note: As R-12 is heavier than air, the escaping vapor may be present at the lowest part of the leak. It is good practice to place the sampling tube under the point being tested for several seconds. In this manner small leaks will not remain undetected.

Using Leak Detector

4. Watch the flame and look for a change in color. If the color does not change, the system is tight and no leaks are present. If the color does change, repair the leak and retest.

5. Shut off the leak detector and allow it to cool.

6. Remove the gauge manifold.

Assignment:

1. Light the leak detector and learn how to warm up the reactor plate.

2. Place the sampling tube over a recently discharged can of R-12 and watch the color of the flame change.

3. Why should the sampling tube be placed under the point being tested?

4. What major caution should be observed when using the leak detector?

5. Name several other cautions.

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 6 How to Charge the System

Tools needed: Gauge manifold, service valve wrench, leak detector, tachometer, can tap.

Materials needed: 1 lb. cans of R-12

Note: Before performing this service, evacuate the system, and refer to the manufacturer's specifications to determine system capacity. To charge the system proceed as follows:

INSTALL GAUGE MANIFOLD SET

1. Connect the gauge manifold to the compressor service valves. Close both gauge manifold valves.

Closing Manifold Valves

2. Turn the compressor service valves to the mid-position.

Opening Service Valve Gauge Ports

CONNECT MANIFOLD CENTER HOSE TO REFRIGERANT CAN

1. Close the valve at the can tap - turn counterclockwise to open.

   Attach the can tap to a 1 lb. can of refrigerant.

2. Connect the center hose to the can tap valve.

3. Close the valve at the can tap - turn clockwise. This will pierce the can.

4. Open the valve at the can tap - turn counterclockwise. This will charge the center hose with refrigerant.

5. Momentarily open and close the center hose of gauge manifold. This will purge air from the center hose.

CHARGE THE SYSTEM

Caution: When charging the system keep the can of refrigerant in an upright position. If the can is inverted liquid refrigerant will enter the system and damage the compressor.

1. Start the engine and adjust the idle to 1500 R.P.M. Adjust the air conditioning controls for maximum cooling.

2. Slowly open the low side-gauge manifold valve.

   Refrigerant gas will enter the system.

   Note: Continue charging until the can is empty. In order to determine when the can is empty, observe the frost line on the outside of the can. As refrigerant enters the system, the frost line will move down on the outside of the can.

3. When the can is empty, close the low side-gauge manifold valve. Then slowly loosen the center hose at the gauge manifold set to relieve pressure. Remove the valve at the can tap.

4. Install another 1 lb. can of refrigerant and continue to charge the system, as described, to full capacity.

5. Check the sight glass for bubbles. If bubbles appear, add refrigerant in ¼ lb. increments until the bubbles disappear.

6. Test the system for leaks.

7. Return the engine speed to a normal idle.

REMOVE GAUGE MANIFOLD

1. Back seat both compressor service valves - turn counterclockwise.

2. Remove gauge manifold from the service valves and replace the protective caps.

3. Remove the can tap from the 1 lb. refrigerant can.

Assignment:

1. Connect a 1 lb. can of refrigerant to the center hose.

2. Connect the gauge manifold to the service valves.

   Your instructor will help you charge the system.

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 7 How to Add a Partial Charge

Tools needed: Gauge manifold, service valve wrench, can tap.

Material needed: One pound cans of R-12

To make a partial charge proceed as follows:

CONNECT GAUGE MANIFOLD AND REFRIGERANT TO SYSTEM

1. Connect the gauge manifold to the service valves. Adjust both gauge manifold valves to the closed position by turning them clockwise. Adjust both service valves to the mid-position.

2. Connect a 1 lb. can of R-12 to the center charging hose. Momentarily open and close the center charging hose of gauge manifold to purge the air. Close the can tap valve.

3. Open the low-pressure-gauge manifold valve, turn to the full counterclockwise position.

CHARGE THE SYSTEM

1. Start the engine and adjust the idling to approximately 1500 RPM. Adjust the air conditioning controls for maximum cooling.

2. Open the can tap valve and add refrigerant to the system.

   Note: Add refrigerant in one half pound amounts until the sight glass is clear of bubbles. Then add one half pound more.

   Caution: During charging the high pressure side may build up excessively. Do not allow this pressure to exceed 240 lbs. Stop engine, determine the cause and correct it.

3. Adjust both service valves to the full counterclockwise position. Remove the gauge manifold.

4. Test the system for leaks.

Connections for charging system.

Assignment:

1. Why are the service valves adjusted to the mid-position when charging the system?

2. To what side of the system do we add a partial charge?

3. State a reason why the high side-pressure might exceed 240 lbs.

UNIT VII - BASIC SERVICE PROCEDURE

Lesson 8 How to Isolate the Compressor

Tools needed: Service valve wrench, tachometer, tool kit

When it is necessary to remove a compressor for repair or replacement the compressor may be isolated from the system. The procedure is recommended as the system will remain sealed and the refrigerant charge will not be lost.

Note: This procedure applies only to compressors equipped with hand shut-off valves, and to compressors that are in operating condition.

ISOLATE THE COMPRESSOR

1. Start the engine and adjust the idling to 1,500 RPM. Adjust the air conditioning controls for maximum cooling. Operate the system for fifteen minutes. This procedure will return most of the oil to the compressor.

2. Return the engine speed to a normal idle; turn the engine and air conditioner controls off.

3. Close the high-pressure and low-pressure service valves by turning to the full clockwise position.

4. Loosen the protection cap on the high pressure service valve gauge part.

5. Crack the high-pressure service valve and allow the refrigerant gas to bleed off slowly.

   Caution: Bleed slowly or the compressor oil will also be discharged.

6. Close the high-pressure service valve - turn clockwise.

7. Disconnect the service valves at the compressor. The compressor is now isolated and may be removed.

   Caution: Do not disconnect the hoses at the service valves.

Assignment:

1. Why is it recommended that we operate the system and return the oil to the compressor before the compressor is isolated?

2. Why should the protection cap on the service valve gauge part be loosened slowly?

3. What would happen if a hose was disconnected at the service valve?

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 9 — How to Evacuate the Compressor and Return it to Service

Tools needed: Gauge manifold, service valve wrench, tool kit

Material needed: 1 lb. can of R-12, service valve gaskets or seals

To evacuate the compressor proceed as follows:

PURGE AIR FROM THE COMPRESSOR

1. Connect the service valves at the compressor.

   Note: Always install new gaskets or seals.

2. Open the high-pressure-gauge manifold valve. Close the low-pressure gauge manifold valve.

3. Crack the suction service valve. Refrigerant pressure in the low side of the system will force air out of the compressor through the high-pressure-gauge manifold valve.

4. Purge the air from the compressor for a few seconds. Close the high-pressure-gauge manifold valve.

Compressor Service Valves Removed

CHECK SYSTEM CHARGE

1. Mid-position both compressor service valves.

2. Start the engine and operate the system for fifteen minutes.

   Check sight glass for bubbles.

3. Add a partial charge if necessary.

4. Turn both compressor service valves to the full counterclockwise position.

5. Remove the gauge manifold.

6. Test the service valves for leaks.

Assignment:

1. What would happen if a compressor was not evacuated?

2. Would a new compressor have to be evacuated?

3. What procedure would be necessary if a service valve leaked?

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 10 Refrigeration Oil

Objective: To learn the need for refrigeration oil in an automotive air conditioning system, and cautions in its use.

Oil is needed in the compressor to eliminate wear on the cylinder wall, piston, and other moving parts. Oil also lubricates the thermostat expansion valve, and keeps it from sticking. Compressor seals are kept pliable by oil, and this aids in preventing oil leaks.

As a small amount of oil is always present on the cylinder wall, it comes into contact with the refrigerant and circulates in the system. For this reason, refrigeration oil must be highly refined and non-forming.

Rules to remember concerning refrigeration oil are:

1. Never use motor oil, or any other type of oil, as a substitute for refrigeration oil.

2. Always use the viscosity recommended by the compressor manufacturer.

3. Never reuse refrigeration oil.

4. Always keep the oil containers tightly capped to prevent contamination by humidity or foreign substances.

5. Always follow the manufacturers instructions when checking the oil level. Methods of checking the oil level, and adding oil vary, as system and compressor design may dictate.

6. Always replace the access plug as quickly as possible.

The dipstick method of checking oil level is shown.

Assignment:

1. What is meant by the term non-foaming?

2. What does "viscosity" mean?

3. Can moisture enter a capped container?

UNIT VII - BASIC SERVICE PROCEDURES

Lesson II How to Check and Add Oil to the Compressor (Chrysler, York, Tecumsek)

Tools needed: Gauge manifold, service valve wrench, tool kit, leak detector, vacuum pump, dipstick.

Material needed: R-12, refrigeration oil

General

The oil level of the compressor should be checked:

1. As a periodic service - every 10,000 miles.
2. Whenever a system component is replaced.
3. Whenever a compressor is serviced or replaced.
4. Whenever the refrigerant charge is lost because of collision damage.

Before checking the oil level, start the engine and operate the air conditioner for fifteen minutes. To check and add oil proceed as follows:

CHRYSLER

1. Discharge the system.
2. Slowly remove the oil plug and insert a dipstick.
3. The oil level should be 2 inches on the dipstick. If oil is needed add oil to the proper level.
4. Evacuate the system.
5. Charge the system.
6. Test the system for leaks.

YORK AND TECUMSEK

Note: This procedure applies to compressors equipped with hand shut-off service valves.

1. Isolate the compressor.
2. Slowly remove the oil plug and insert a dipstick.

Note: These compressors are available in several models. The amount of oil specified varies from six to ten ounces, and will measure 7/8" to 1 3/16" on the dipstick. The compressor model must be identified in order to check the oil.

3. If oil is needed add oil to the proper level. Install the plug.

4. Evacuate the compressor and return it to service.

5. Test the system for leaks.

YORK AND TECUMSEK

Note: This procedure applies to compressors equipped with Schrader service valves.

1. Discharge the system.

2. Check the oil level. Follow the procedure outlined in steps 2 and 3 above.

3. Evacuate the system.

4. Charge the system.

5. Test the system for leaks.

Assignment:

1. Isolate the Tecumsek compressor. Your instructor will teach you how to identify the compressor model and how to check the oil.

UNIT VII - BASIC SERVICE PROCEDURES

Lesson 12 How to Check and Add Oil to the Compressor (General Motors Six Cylinder)

Tools needed: Gauge manifold, vacuum pump, leak detector, container indicating ounces, tool kit, tachometer.

Material needed: R-12, refrigeration oil

Note: It is not recommended that the oil in the compressor be checked as a periodic service because the oil cannot be checked while the compressor is installed on the car. The oil should only be checked when a hose has burst, or a system component is replaced.

To check or add oil to the compressor proceed as follows:

REMOVE COMPRESSOR AND DRAIN THE OIL

1. Start the engine and adjust the speed to 1,200 RPM. Adjust the air conditioning controls for maximum cooling and operate the system for fifteen minutes.

2. Return the engine speed to a normal idle and stop the engine.

3. Discharge the system.

4. Remove the compressor.

5. Remove the drain plug, hold the compressor in a horizontal position over the container and drain the oil.

6. Measure and record the amount of oil drained and discard the oil.

ADD OIL TO THE COMPRESSOR

Note: If the oil drained from the compressor is contaminated or contains water, it will be necessary to replace the receiver drier and flush the system components with liquid refrigerant. Add the full 11 ounce charge to the compressor.

If the oil is not contaminated, proceed as follows:

1. If the amount of oil drained was 4 ounces or more, add the same amount of oil to the compressor.

2. If the amount of oil drained was less than 4 ounces add 6 ounces to the compressor.

UNIT VIII - COMPRESSOR CRANKSHAFT SEAL REPAIR PROCEDURES

Lesson I - How to Replace the General Motors Six Cylinder Compressor Crankshaft Seal

Tools needed: Gauge manifold, hub and drive plate puller, hub and drive plate installer, pulley puller, seal seat remover, shaft seal remover and installer, "O" ring remover, charging line adaptor plate, vacuum pump, can tap, support bracket, tool kit, leak detector.

Material needed: Seal kit, refrigeration oil, R-12

Note: The use of proper tools is essential when performing this compressor service. Do not attempt to reseal the compressor without them.

REMOVE THE COMPRESSOR

1. Discharge the system.

2. Disconnect the driving belts and the hoses at the compressor. Remove the compressor.

3. Remove the clutch.

REMOVE THE CRANKSHAFT SEAL

Caution: Perform the following operations carefully. Do not nick or scratch the shaft or housing.

1. Remove the seal seat retaining ring.

Removing Seal Seat Retaining Snap Ring

2. Install the seal seat remover on the flange of the seal seat and remove the seal seat.

Removing Shaft Seal

3. Install the shaft seal remover and engage the locking tongs of the tool with the tabs of the shaft seal. Remove the shaft seal.

Removing Seal Seat

5829

4. Engage the "O" ring with the hook of the tool and remove the "O" ring from the housing.

Removing Shaft Seal Seat O-Ring

INSTALL THE SEAL

Note: All seal parts must be kept clean.

1. Clean the housing and shaft with refrigeration oil. Apply refrigeration oil to all seal parts.

2. Place the "O" ring on the shaft seal remover and installer and position the "O" ring in its groove by pressing down on the sleeve of the installer. Turn the tool slowly and remove the tool.

3. Place the shaft seal on the seal installer. Engage the locking tongs as shown and insert the tool and seal over the shaft. Turn the seal and engage the flat on the shaft. Remove the tool.

Replacing Seal and "O" Ring

4. Install the seal seat on the seat installer and install the seal seat.

5. Install the seal seat retaining ring.

Note: The flat surface of the retaining ring must face the seal seat.

LEAK TEST THE COMPRESSOR

1. Install the charging adaptor plate to the compressor.

Charging Line Adapter Plate

2. Install the can tap on a 1 lb. can of R-12. Connect center manifold hose to can tap part and to gauge manifold.

3. Connect the gauge manifold to adaptor plate at the compressor.

   Open the valve on the can tap and momentarily loosen the center hose to purge the air from the lines and the compressor.

4. Open the gauge manifold hand valves and pressurize the compressor.

5. Rotate the crankshaft and test the seal and shaft areas for leaks with the leak detector.

6. Close the valve on the can tap. Slowly disconnect the center hose at the gauge manifold and allow the pressure to bleed off.

7. Remove gauge manifold and the adaptor plate.

8. Install the clutch.

INSTALL COMPRESSOR

1. Mount the compressor on the engine and connect the hoses and clutch lead.

2. Adjust the driving belts.

RETURN SYSTEM TO OPERATION

1. Evacuate the system.

2. Charge the system.

3. Test the system for leaks.

UNIT VIII - COMPRESSOR CRANKSHAFT SEAL REPAIR PROCEDURES

Lesson 2 — How to Replace the York and Tecumseh Compressor Crankshaft Seal

Tools needed: Gauge manifold, vacuum pump, leak detector, 5/8" x 2" NC bolt, tool kit, jumper wire.

Material needed: Seal kit, refrigeration oil, R-12

Note: If the compressor is equipped with hand shut-off service valves isolate the compressor. If the compressor is equipped with Schrader type service valves, connect the gauge set and discharge the system.

REMOVE THE COMPRESSOR

1. Disconnect the service valves at the compressor. Remove the driving belts. Disconnect the clutch lead at the bullet connector.

2. Connect a jumper wire from the position terminal of the battery to the clutch field lead and engage the clutch.

3. Remove the clutch hub bolt and install the 5/8" NC bolt in the clutch hub. Tighten the bolt slowly and remove the clutch.

4. Remove the compressor mounting bolts and remove the compressor.

REMOVE THE SEAL

1. Remove the Woodruff key from the crankshaft.

2. Remove the seal plate bolts and carefully pry the plate loose.

   Caution: Do not injure the sealing surfaces or the crankshaft.

3. Remove the carbon ring and the seal assembly.

4. Remove the gasket and clean the crankcase and seal plate mounting surfaces. Clean the crankshaft.

INSTALL THE SEAL - YORK COMPRESSOR

1. Apply refrigeration oil to the new seal and crankshaft.

2. Place the seal on the crankshaft with the carbon ring retainer facing out, and engage the seal drive ring slats with the drive pins on the crankshaft journal.

Crankshaft Seal Installation—York Compressor

3. Place the carbon ring on the crankshaft and in the seal ring retainer. The polished surface of the carbon ring must face out.

4. Apply refrigeration oil to the crankcase and seal cover plate and install the gasket on the crankcase.

   Note: Match the gasket from the seal kit with the original gasket. Alternate gaskets are supplied in the seal kit.

5. Install the seal cover plate with the polished side facing in. Install the capscrews and tighten evenly and in a diagonal manner. Torque is 7-13 foot lbs.

INSTALL THE SEAL TECUMSEH COMPRESSOR

1. Apply refrigeration oil to the new seal and crankshaft.

2. Install the seal on the crankshaft with the end that fits the carbon ring facing out.

Crankshaft Seal Installation--Tecumseh Compressor

3. Place the carbon ring on the crankshaft with the raised rim of the carbon ring facing outward.

4. Install the "O" ring and seal plate cover on the crankshaft. Align the seal plate cover with the crankcase and install the capscrews.

5. Tighten the capscrews carefully and in a diagonal manner.

   Torque is 6-10 foot lbs.

INSTALL THE COMPRESSOR

1. Install the Woodruff key and align the key in the shaft.

2. Install the clutch and snug the hub bolt.

3. Install the compressor and tighten the mounting bolts.

4. Engage the clutch with a jumper wire and torque the hub bolt 20-30 foot-lbs. Remove the jumper wire and connect the clutch field lead.

5. Install the driving belts and adjust the belts.

6. Connect the service valves to the compressor - use new gaskets or seals.

RETURN COMPRESSOR TO SERVICE

1. If the compressor was isolated, evacuate the compressor and add a partial charge.

2. If the system was discharged, evacuate the system and charge the system.

3. Test the system for leaks.

UNIT VIII - COMPRESSOR CRANKSHAFT SEAL REPAIR PROCEDURES

Lesson 3 — How to Replace the Chrysler Compressor Crankshaft Seal

Tools needed: Gauge manifold, vacuum pump, can tap, leak detector, tool kit, 5/8" NC or NF bolt

Material needed: Seal kit, refrigeration oil, R-12

The Chrysler "V" type compressor crankshaft seal can be replaced without removing the compressor from the engine. Discharge the system, remove the clutch, and proceed as follows:

REMOVE THE SEAL

1. Remove the Woodruff key, and the crankshaft housing seal bolts.

2. Remove the bearing housing from the case. Insert two screwdrivers in the slots provided, and pry the housing from the case.

Crankshaft Bearing Housing Removal

3. Remove the crankshaft bearing housing seal face-plate from the bearing housing.

   Note: This is part of the gas seal replacement package and must be replaced when the gas seal is replaced.

4. Remove the gas seal from the crankshaft

INSTALL THE SEAL

Note: The crankshaft gas seal replacement package consists of the crankshaft gas seal assembly and the crankshaft bearing housing seal face plate. Two types of crankshaft seals are supplied for service, as shown. If the replacement package contains the cartridge-type seal, follow the entire installation procedure given below. If the replacement package contains the unitized-type seal, steps 1, 2, and 4 will not apply.

Gas Seal Identification

1. Before installing the cartridge-type gas seal assembly, insert the assembly to make sure that the tangs index the slots of the mating part. This will insure proper spring action. The carbon seal must be assembled, as shown.

2. Hold the seal firmly on the outside edge to prevent it from rotating out of the index slots.

3. Lubricate the crankshaft with refrigerant oil. Slide the seal on the crankshaft with the smooth (carbon seal) surface up, or toward the front of the compressor.

4. When the seal bottoms against the crankshaft bearing, test indexing of tangs again by pressing down with thumbs to see if it has the proper spring action.

Checking Indexing of Tangs

5. Lubricate and install the crankshaft bearing housing seal face plate with the smooth (micro-finish) side up. Use a sleeve with the minimum inside diameter of 1 3/8 inches to avoid damaging the micro-finish sealing surface of the face plate. Tap sleeve lightly until the seal face plate is fully seated in the housing.

6. Install the bearing housing oil seal, using plenty of refrigerant oil.

7. Install the housing, making sure that it is in proper alignment with the screw holes. The gas seal assembly may be damaged if the bearing housing is rotated after the housing seal contacts the carbon seal.

8. Install bolts and tighten 10 to 13 foot-pounds torque.

RETURN COMPRESSOR TO SERVICE

1. Install the clutch

2. Evacuate the system

3. Charge the system

4. Test the system for leaks

Drawings and part of text courtesy of Chrysler Corporation.

Assignment:

1. Write a composition and state the key points and cautions to remember when performing compressor crankshaft seal repair procedures.

2. Prepare a list of the special tools required and explain their use. Refer to page 10 (Special tools and equipment).

5839

UNIT IX - THE CONDENSER

Lesson I — The Condenser's Function in the System

Objective: To learn what the condenser does.

The purpose of the condenser is to dissipate heat. For this reason, it is mounted in front of the car radiator.

The condenser is similar in design to a cooling system radiator, but it is engineered to withstand much higher pressure. Heat dissipation is accomplished as air passing through the condenser fins cools the hot refrigerant gas. As the refrigerant gas cools it condenses, and drops to the bottom of the condenser. For this reason the inlet to the condenser is always located at the top.

The refrigerant is then directed to the receiver drier as a high pressure liquid.

Assignment:

1. What does the condenser do?
2. Why must the condenser inlet be located at the top?
3. What effect do you think the condenser has on the car cooling system?
4. Where is the condenser located?

UNIT IX - THE CONDENSER

Lesson 2 How to Service the Condenser

Tools needed: Condenser comb, air gun, tool kit.

Note: In event a condenser developes a leak, do not attempt to repair it by welding, brazing, or soldering. The condenser must be replaced.

To service a condenser proceed as follows:

1. Tighten the condenser mounting bolts.

2. Clean the condenser with an air gun. Blow out leaves, bugs, and foreign material.

   Note: Bug screens are not recommended as they decrease air flow and reduce cooling efficiency.

3. If the condenser fins are bent, straighten them with the condenser comb.

Caution: This service must be performed carefully. Apply light pressure to the comb as you straighten bent fins. Too much pressure may rupture a condenser tube.

Condenser Comb

Assignment:

1. Why is unrestricted air flow through the condenser important?

2. Practice using the condenser comb.

UNIT X - THE RECEIVER DRIER

Lesson I — The Receiver Drier's Function in the System

Objectives: 1. To learn what the receiver drier does.

2. To learn where the receiver drier is located.

The receiver drier has four functions to perform in an automotive air conditioning system. They are:

1. Storage
2. Moisture absorption
3. Filtration
4. Trouble diagnosis

The receiver drier is located at the front of the car radiator, or in the engine compartment as close to the radiator as possible. The reason for this is to keep the unit cool so the refrigerant will remain in a liquid state. Another reason is because water and refrigerant do not mix when the refrigerant is a liquid. This is the best place to extract water.

This location also places the unit before the thermostat expansion valve. The valves function must be performed at the start of the refrigeration cycle.

Assignment:

1. What does a receiver drier do?
2. Give three reasons for its location in the system.

UNIT X - THE RECEIVER DRIER

Lesson 2 — Storage

Objective: To learn the purpose of the receiver section of the receiver drier.

Refrigerant enters the receiver drier as a high pressure liquid, and is stored in the receiver section until it is needed in the evaporator. It is normal however for the liquid refrigerant to contain some gases. For this reason, the receiver drier is constructed with a pickup tube which extends to the bottom of the unit. The liquid refrigerant, being heavier than the gas, drops to the bottom and the gas remains on top. In this way a solid column of liquid refrigerant is insured at the thermostat expansion valve.

The receiver section serves another purpose. Normal refrigerant loss through hose porosity and other minute leaks, is considered to be ½ lb. of refrigerant a year. The receiver section acts as a reservoir for the refrigerant, and makes system efficiency less dependent upon a precise state of charge.

Assignment:

1. If the refrigerant condenses to a liquid in the condenser, why is it normal to have some gases in the receiver?

2. Why is it necessary to have a solid column of liquid refrigerant to the thermostat expansion valve?

3. What is normal leak down?

UNIT X - THE RECEIVER DRIER

Lesson 3 — Moisture Absorption

Objectives: 1. To learn how damaging moisture is to an automotive air conditioner.

2. To learn how the receiver drier absorbs moisture.

Moisture will damage any refrigeration system. At low temperature it may freeze in the thermostat expansion valve and stop the cooling cycle. It also may freeze over the filtering screens and stop filter action. Moisture combined with oil in the compressor will form sludge and damage the compressor by lack of lubrication. When mixed with the refrigerant, moisture produces a highly corrosive acid. This will damage the evaporator, condenser, and compressor.

The receiver drier contains an element that absorbs moisture. The element is known as a dessicant, and usually consists of silica gel. Silica gel separates moisture from the refrigerant, and prevents damage to the components of the refrigeration system.

Because the dessicant is so eager to perform its function and absorb moisture, new receiver driers are capped tightly when stored. When installing a new unit, have all service tools required ready, and keep the unit sealed until connections are made.

Assignment:

1. What might happen if acid produced a hole in the evaporator?

2. What might happen if acid produced a hole in the condenser?

3. What units might be damaged if sludge was formed in the system?

UNIT X - THE RECEIVER DRIER

Lesson 4 — Filtration

Objective: To learn the purpose of a filter

Filters are used to remove particles of foreign material from the refrigerant. Such particles, circulating in the system, could block the thermostat expansion valve or damage the compressor.

In the unit shown, refrigerant flows through a screen, then through the filter, and again through a screen. This location of screens keeps the filter material from separating and circulating through the system.

Where evidence of frosting at the receiver outlet exists, a clogged filter may be suspected. Replace the receiver drier, as the filter cannot be cleaned.

Assignment:

1. How could foreign material enter the system?

2. Why would a clogged filter cause the receiver drier to frost?

UNIT X - THE RECEIVER DRIER

Lesson 5 — Trouble Diagnosis

Objective: To learn the purpose of a liquid sight glass in the receiver drier.

Liquid sight glasses are installed in the liquid line of all refrigeration systems. They are used as a service aid when diagnosing system troubles.

The liquid sight glass is an intergral part of the receiver drier, and it is located in the outlet line, or center of the unit as shown:

The unit has a protective plug, which when removed, allows us to see into the refrigerant system and determine if it is fully charged. The appearance of foam or bubbles beneath the sight glass, when the temperature of the air surrounding it is above 70°F, informs us that there is a shortage of refrigerant, or air is in the system. However, it is important to remember, that continuous bubbles may appear in a fully charged system, if the temperature of the surrounding air is low.

UNIT X - THE RECEIVER DRIER

Lesson 6 How to Use the Sight Glass

Tools needed: Push button remote control

The sight glass is used to determine if the system contains a full charge of refrigerant. To check the system for state of charge proceed as follows:

1. Start the engine and adjust the idle speed to 1,200 RPM.

2. Adjust the air conditioning controls for maximum cooling, and allow system to operate for fifteen minutes.

3. Remove the protective cap from the sight glass and clean the glass.

4. Observe the sight glass and note which of the following conditions exist:

LIQUID SIGHT GLASS

The presence of foam or bubbles

This indicates a system that is undercharged. Add refrigerant as necessary and check the system for leaks.

The absence of foam or bubbles

This indicates a fully-charged system, or a completely discharged system. To determine which condition exists, proceed as follows:

1. Disconnect the lead wire to the clutch at the bullet connector.

2. Connect the push button remote control from the position terminal of the battery to the clutch field lead.

3. Cycle the clutch off and on with the remote control while the system is operating.

If the system contains refrigerant, foam or bubbles will appear when the clutch is cycled off, and disappear when the clutch is cycled on.

If bubbles or foam do not appear as the clutch is cycled on and off, the system is discharged.

Assignment:

1. Where is the sight glass located?

2. Why can foam or bubbles appear in a fully charged system when the clutch is cycled off?

3. Is the sight glass on the high or low pressure side of the system?

5848

UNIT X - THE RECEIVER DRIER

Lesson 7 How to Replace the Receiver Drier

Tools needed: Gauge manifold, vacuum pump, tool kit, leak detector

Materials and parts needed: R-12, receiver drier

To replace the receiver drier proceed as follows:

DISCHARGE THE SYSTEM

1. Connect gauge manifold to the compressor service valves.

2. Discharge the system.

REMOVE THE RECEIVER DRIER

1. Disconnect the lines at the inlet and outlet of the receiver drier and cap the lines. Notice the position of the "in" and "out" working.

2. Remove the mounting bolts or brackets and discard the receiver drier.

INSTALL THE RECEIVER DRIER

1. Install the receiver drier in its original position.

   Note: Do not remove the sealing caps until you are ready to connect the lines as the dessicant will immediately begin to absorb moisture.

2. Connect the lines at the inlet and outlet.

   Note: The outlet line from the condenser must be connected to the inlet of the receiver drier.

EVACUATE THE SYSTEM

1. Connect the vacuum pump to the gauge manifold center connection.

2. Operate the vacuum pump for a minimum of thirty minutes.

3. Disconnect the vacuum pump.

CHARGE THE SYSTEM

1. Connect a container of R-12 to gauge manifold center connection.

2. Add the recommended charge and check the sight glass.

3. Test the system for leaks.

4. Remove the gauge manifold.

Assignment:

1. Why should the gauge manifold be connected to the system before it is discharged?

2. What do you think might happen if the lines to the receiver drier were connected wrong?

3. What additional procedure could you follow that would reduce the entrance of moisture into the receiver drier?

UNIT XI - THE THERMOSTATIC-EXPANSION VALVE

Lesson I — The Thermostatic-Expansion Valve's Function in the System

Objective: 1. To learn what the thermostatic-expansion valve does.

2. To learn where it is located in the refrigeration system.

Several methods of supplying the proper amount of liquid refrigerant to the evaporator have been used. The most popular method uses a thermostatic-expansion valve. Briefly stated, the thermostatic-expansion valve meters liquid refrigerant as needed, to the evaporator.

The valve is the dividing point in the refrigeration circuit between high pressure liquid supplied by the receiver drier, and low pressure liquid and gaseous refrigerant in the evaporator.

The valve is designed so that the temperature of the refrigerant at the evaporator outlet must have 4°F of superheat before more liquid refrigerant is permitted to enter the evaporator. By superheat, we mean an increase in temperature of the gaseous refrigerant <u>above</u> the temperature at which the refrigerant vaporized.

The thermostatic-expansion valve is located at the inlet side of the evaporator.

Assignment:

1. What does the thermostatic-expansion valve do?

2. What do we mean by the term "superheat?"

3. Where is the thermostatic-expansion valve located?

4. What is the phase of the refrigerant when it enters the thermostatic-expansion vlave?

UNIT XI - THE THERMOSTATIC-EXPANSION VALVE

Lesson 2 — How the Thermostatic-Expansion Valve Functions

Objectives: 1. To learn how the valve is constructed.

2. To learn how the valve meters and controls the flow of liquid refrigerant into the evaporator.

Expansion Valve Connections

The valve consists of the following parts:

Valve body; valve and seat; valve spring; diaphragm; operating pins; inlet screen; capillary tube;and remote bulb.

As we learned previously, the valve is located at the inlet side of the evaporator. However, the remote bulb is located at the evaporator outlet pipe. This location of the bulb allows it to communicate the temperature of the refrigerant at that point, through the capillary tube, to the valve body.

The capillary tube and remote bulb is filled with carbon dioxide gas, which exerts a pressure above the diaphragm. The valve is closed by pressure of the spring. When the air conditioning system begins to operate, the compressor draws refrigerant gas from the evaporator, lowering the pressure in the evaporator and under the diaphragm. As the pressure in this area is reduced, the pressure above the diaphragm exerted by the gas in the capillary, overcomes the spring pressure, and forces the diaphragm against the operating pins. This action opens the valve and meters liquid refrigerant into the evaporator starting the cooling cycle.

As the temperature at the outlet pipe of the evaporator cools, gas pressure above the diaphragm and in the capillary decreases, allowing the spring to move the valve toward its seat. This action closes the valve and shuts off the flow of liquid refrigerant.

In this manner the flow of liquid refrigerant into the evaporator is controlled, and the system is cycled "off" and "on", depending on the temperature of the evaporator outlet pipe.

Assignment:

1. Name the parts of a thermostatic-expansion valve.

2. Describe the manner by which the valve is opened.

3. Describe the manner by which the valve is closed.

3. What do you think would happen if the valve stuck open and flooded the evaporator?

UNIT XI - THE THERMOSTATIC-EXPANSION VALVE

Lesson 3 — How to Test the Thermostatic-Expansion Valve

Tools needed: Gauge manifold, vacuum pump, leak detector, can tap, service valve wrench, flare wrenches, tool kit.

Material needed: 1 lb. can of R-12, refrigeration oil, tray of ice.

To test the thermostatic-expansion valve, discharge the system and proceed as follows:

REMOVE THE VALVE

1. Disconnect the liquid line at the valve.

   Note: Use a back-up wrench and hold the valve while using a flare wrench on the liquid line nut.

2. Remove the valve from the evaporator.

   Note: The procedure in removing the valve will vary with the design of the evaporator. Always notice the location of the capillary and remote bulb, and use care when removing it to prevent damage.

TEST THE VALVE

1. Make an adaptor using the necessary fittings and connect the valve inlet to the gauge manifold charging hose.

2. Connect the charging hose to a 1 lb. can of R-12, and open the valve at the can tap ¼ turn. Refrigerant gas should escape from the valve outlet.

   Note: If the refrigerant gas does not escape, the capillary and bulb have lost their charge or the valve diaphragm is defective. Replace the valve.

3. If the gas did escape in step 2, it will now be necessary to determine if the valve will close and shut off refrigerant flow when cold.

4. Place the remote bulb in the tray or container of ice. The valve should close and stop the flow of escaping refrigerant.

   If the refrigerant continues to escape the valve is defective.

If the refrigerant does not escape the valve is good.

REPLACE THE VALVE

1. Install the valve or a new replacement and connect it to the evaporator. Connect the liquid line. Apply refrigeration oil to all threads.

   Note: Install the remote bulb and the capillary in their original position, and be sure the contacting areas of the evaporator outlet are clean.

RETURN SYSTEM TO SERVICE

1. Evacuate the system

2. Charge the system

3. Test the system for leaks

4. Performance test the system. (Unit XV lessons 1, 2, 3)

Assignment:

1. Remove the thermostatic-expansion valve from the evaporator and test the valve. Follow the procedure described in this lesson.

UNIT XII - THE EVAPORATOR

Lesson I — Function in the System

Objective: To learn how the evaporator cools and dehumidifies the air.

The evaporator core consists of a series of coils in a radiator type container. Its outer shell is made of steel or plastic, and it is located in the dash area.

The purpose of the evaporator core is to cool and remove the moisture from the air that is flowing through it, when the air conditioner is operating.

High pressure liquid refrigerant from the thermostatic-expansion valve enters the core. As the pressure in the evaporator is lower, the refrigerant immediately boils. Heat from the core's surface is given up to the vaporizing refrigerant which is cooler than the core. This, in turn, cools the core surface. Air passing through the fins of the evaporator also gives up its heat to the cooler surface of the core and is circulated by blower action in the car.

As the process of heat loss from the air to the evaporator core takes place, moisture in the air condenses on the outside of the core, and drops to a drip-pan at the bottom of the evaporator shell. The water is drained from the drip-pan, by hoses, to the under body of the car.

Assignment:

1. What is the purpose of the evaporator?

2. In what physical phase is the refrigerant as it leaves the evaporator?

3. Why does the air passing through the evaporator give up its heat?

4. Name the principle by which the air is dehumidified.

5858

UNIT XII - THE EVAPORATOR

Lesson 2 Evaporator Pressure Control Devices

Objective: To learn the types and need for an evaporator pressure control device in an air conditioning system.

In order to regulate the pressure in the evaporator during the refrigeration cycle, a pressure control device is needed. The device is needed to maintain maximum evaporator cooling, and control the formation of ice or frost on the evaporator fins and tubing.

If the pressure in the evaporator exceeds the recommended pressure, cooling efficiency will decrease at the rate of 1°F per pound of pressure.

If the pressure in the evaporator is lowered below the recommended pressure, the evaporator will ice up and restrict the flow of cooling air.

Two pressure control devices are:

1. The evaporator pressure regulator valve (EPR).

This valve is used on Chrysler Corp. cars. It is located in the compressor behind the suction service valve port connection, and is not adjustable.

2. The suction throttling valve (STV).

This valve is used on General Motors cars. It is located in the suction line, and the valve is adjustable.

Suction Throttling Valve

Assignment:

1. Describe the purpose of an evaporator pressure control device.
2. What will happen if the pressure in the evaporator is lowered?
3. Where is the E.P.R. located?
4. Where is the S.T.V. located?
5. Which valve is adjustable?

UNIT XII - THE EVAPORATOR

Lesson 3 How to Test and Adjust the S.T.V.

Tools needed: Gauge manifold, vacuum gauge, tool kit, tachometer.

Note: Operation of the S.T.V. is controlled by vacuum or by a Bowden cable. To test and adjust the vacuum controlled type proceed as follows:

TEST THE VALVE

1. Install the gauge manifold. Connect the suction pressure gauge to the connection at the S.T.V. Connect the high-pressure gauge to the compressor discharge valve.

2. Start the engine and adjust the idle speed to 1,000 R.P.M. Adjust the air conditioning controls for maximum cooling and operate the system 15 minutes.

3. Record the pressure as indicated on the suction gauge, and compare this pressure with specifications. Pressure should be approximately 28 P.S.I.

   If the pressure is incorrect, remove the vacuum hose at the S.T.V. and install the vacuum gauge. The gauge should indicate 4-6 inches of vacuum. If this value is not obtained, check the hoses for kinks and leaks and check the vacuum controls. Repair as indicated.

4. Adjust the air conditioner controls to "warmer" and operate the system for 10 minutes. The suction gauge pressure should rise 3 P.S.I.

ADJUST THE S.T.V.

1. If adjustment of the S.T.V. is necessary, loosen the lock nut and rotate the vacuum unit to obtain the desired pressure. Turn the vacuum unit chockwise to raise the pressure, counterclockwise to lower the pressure. Tighten the locknut.

5861

Adjusting Suction Throttling Valve

2. Recheck operation of the S.T.V. To test and adjust the Bowden cable-controlled-type follow the procedure outlined above, but first adjust the Bowden cable.

ADJUST THE BOWDEN CABLE

1. Adjust the temperature control lever to the maximum cold position.

2. Loosen the cable clamp at the S.T.V.

3. Adjust the length of the cable to position the valve lever against its stop in the forward position. Tighten the cable clamp.

Suction Throttling Valve Cable Adjustment

4. Check the operation of the cable for binding, and be sure the valve lever returns to its stop.

UNIT XII - THE EVAPORATOR

Lesson 4 — How to Test the E.P.R. Valve

Tools needed: Gauge manifold

EPR VALVE TEST CONDITIONS

Normally, this test is performed after completion of the Over-all Performance Test. The gauge manifold will be connected, as shown.

GAUGE MANIFOLD CONNECTIONS (Plymouth)

Adjust the engine speed to 1250 rpm. Close the hood for this test. Open the windows.

Turn the blower switch to position No. 2, push the "Cool" button.

The heat load on the evaporator will soon call for continuous operation of the refrigeration system. The "EPR" valve will open and the pressure at both the suction port and the compressor inlet service port will be about the same. It is normal for the compressor inlet pressure to be slightly lower than the evaporator suction pressure.

Observe the evaporator suction gauge and the compressor inlet gauge. Both should register 26 psi or slightly higher. This shows that the "EPR" valve is open. The next step is to find the minimum evaporator suction pressure maintained in the suction line by the "EPR" valve.

The "EPR" valve action can be speeded by reducing the heat load on the evaporator. This is done by turning the blower switch to position No. 1 ("Low-Speed"), thus reducing the volume of air passing through the evaporator. Immediately the evaporator will start to get colder. It is necessary to watch both suction gauges for the following reactions.

1. Pressure registered at the evaporator suction gauges will become progressively lower.

2. At the same time the compressor inlet gauge will start to fluctuate. This fluctuation is caused by the alternately opening and closing of the "EPR" valve. It indicates that suction pressure is reduced to the point where it just about balances the internal gas pressure in the bellows. The "EPR" valve is actually operating as a modulating valve.

3. When fluctuation at the compressor inlet gauge stops and the pressure registered drops steadily, the "EPR" valve is maintaining minimum suction line pressure. Allow pressure registered at the compressor inlet gauge to drop 15 psi or lower, then read the evaporator suction gauge.

   Note: If, and only if the compressor inlet pressure will not pull down to 15 psi, increase engine speed to approximately 2000 rpm.

4. The suction gauge pressure should be 22 to 26 psi. This shows that the suction pressure held by the "EPR" valve is correct. Again, determine the pressure at which the valve is fully open.

5. Turn the blower switch to position No. 2, push the "Cool" button to increase the heat load on the evaporator. This will increase suction pressure, causing the "EPR" valve to open fully.

Warm evaporator raises suction pressure

6. Watch both the evaporator suction and the compression inlet pressure gauge. The pressure registered at the compressor inlet gauge will increase quite rapidly. Both suction gauges should again hold at a pressure of 26 psi or slightly higher within a few minutes.

   If the minimum suction pressure registered step 4 above is 22 to 26 psi and the suction pressure registered with the valve fully open step 6 above is 26 psi or slightly higher, the "EPR" valve is working normally. A system which passes both the Over-All Performance Test and the "EPR" Valve Test requires no further tests.

SUCTION PRESSURE ABOVE 26 PSI

If the minimum suction pressure is higher than 26 psi step 4 above, the evaporator will not get as cold as it should for maximum performance. It will be necessary to replace the "EPR" valve. Repeat the "EPR" valve test and the Performance Test.

SUCTION PRESSURE BELOW 22 PSI

If the suction pressure goes below 22 psi step 4 above, the evaporator is too cold. The correction is to replace "EPR" valve and repeat the "ERP" valve test.

Drawings and text courtesy of Chrysler Corporation.

UNIT XIII - THE ELECTRICAL CONTROL SYSTEM

Lesson I — How the Electrical Control System Operates the Air Conditioner

Objectives: 1. To learn the components of the electrical system.
2. To learn the flow action of current in the electrical system.

The electrical control system will vary to a great degree, in order to meet the requirements of various types of air conditioning installations. To gain an understanding of how the system functions, we will consider and trace the basic circuit shown in the diagram.

Current flows from the ignition switch accessory terminal through a fuse to the control switch of the air conditioner. When the control switch is turned on, two circuits are energized:

1. Current flows to the blower motor in the evaporator shell. As the control switch is turned clockwise from "on", current flows through more of the rheostat which is a resistance unit and controls blower speed from high to low.

2. Current flows to the contact in the thermostatic switch. If the thermostatic switch remote bulb is warm, the contacts are closed and current then flows to the field windings of the electromagnetic clutch. The clutch will then drive the compressor starting the cooling cycle.

   As the thermostatic remote bulb switch cools, the contacts open, stopping the flow of current to the clutch. This stops compressor operation. The blower will continue to operate, however, and cooling will continue as the clutch is cycled off and on by control of the thermostatic switch.

Assignment:

1. Which switch turns the blower on?

2. What does the rheostat do?

3. Describe the manner in which the current flow to the clutch is stopped.

UNIT XIII - THE ELECTRICAL CONTROL SYSTEM

Lesson 2 — The Thermostatic Switch

Objective: To learn what the thermostatic switch does and how it functions.

The thermostatic switch controls the operation of the compressor by controlling the electro-magnetic clutch.

When the temperature of the evaporator becomes colder than the lower limit for which the switch is set, the switch opens the circuit to the clutch, and stops the operation of the compressor. When the temperature of the evaporator rises to the upper limit at which the switch is set, the switch closes and energizes the clutch. This resumes compressor action, and cooling begins again. The switch works on approximately a 6°F differential. This means the evaporator temperature must warm 6°F for the contacts to close and restart the cycle.

The switch shown in the diagram has a remote bulb connected to a bellows, through a capillary tube. The bellows is connected to a pivot link that has a contact. Another contact is mounted on the frame of the unit. The bulb and capillary are filled with liquid refrigerant. When the refrigerant is warm, it expands and creates a pressure that is transmitted to the bellows. This action moves the pivot link and closes.

the contact points. As the refrigerant cools, it contracts, and the pressure in the bellows is reduced. This action allows a spring which is connected to the pivot link to open the contacts.

Assignment:

1. What material is used to operate the thermostatic switch?

2. Why do the contacts close when they are warm?

3. What does the term "thermal" mean?

4. What circuit is completed when the thermostatic switch contacts are closed?

5. Where is the remote bulb located?

UNIT XIII - THE ELECTRICAL CONTROL SYSTEM

Lesson 3 How to Test the Thermostatic Switch

Tools needed: Ammeter, test lamp, tachometer, thermometer, tool kit.

In the event of a complaint of erratic or no cooling, test the thermostatic switch. The switch may be defective and inoperative, or improperly calibrated. Proceed as follows:

TEST FOR A DEFECTIVE SWITCH

1. Turn the ignition and air conditioner control switch on.

2. Disconnect the clutch field lead at the clutch. Ground the test lamp clip and touch the prod of the test lamp to the lead from the switch. The lamp should light.

3. If the lamp does not light, check the fuse and current supply to the battery terminal of the switch.

4. Ground the test lamp clip and touch the prod of the lamp to the battery side of the switch. If the lamp does not light, trouble lies before the switch.

5. If the lamp did light in step 4, touch the prod of the lamp to the clutch side of switch: If lamp does not light the switch is defective and must be replaced. If lamp does light, check for an open circuit between the switch and the clutch.

IMPROPERLY CALIBRATED

1. Disconnect the clutch field lead at the clutch and connect an ammeter in series.

2. Install the thermometer at the evaporator air discharge.

3. Start the engine and adjust the idle speed to 1,000 rpm. Adjust the air conditioner controls for maximum cooling and operate the system 15 minutes.

4. Note the air discharge temperature and observe the ammeter: The ammeter will indicate clutch current draw as the clutch cycles on and off.

   Air discharge temperature and its relation to cycling of the clutch will vary according to the manufacture. Also, it may be possible to adjust the switch. Refer to the manufacturer's specifications and procedure for adjustment.

Thermostatic Switch Adjustment

Note: If the clutch does not cycle off when the lower temperature is reached, the contacts are probably fused together. This will cause the evaporator to freeze up. Replace the switch.

Assignment:

1. Use the test lamp and make a continuity test to the clutch. Your instructor will help you.

2. Connect an ammeter in series with the clutch and install a thermometer. Record the temperatures at which the clutch cycles and compare the temperatures to specifications. Report to your instructor.

UNIT XIII - THE ELECTRICAL CONTROL SYSTEM

Lesson 4 How to Test the Blower Motor

Tools needed: Ammeter, test lamp, jumper wire.

If a complaint of low velocity or no air discharge is encountered, test the blower motor. Proceed as follows:

LOOSE MOTOR FAN TEST

1. Turn the control switch on and listen for the sound of the motor. If only a hum can be heard, the fan is loose on the motor shaft.

2. Remove the blower and tighten the set-screw in the motor shaft.

Blower Motor and Evaporator Assembly

MOTOR CURRENT DRAW TEST

This test will determine if the motor is defective.

1. Disconnect the wires to the blower motor at the bullet connector.

   Note: Do not disconnect the ground wire.

2. Connect an ammeter in series with a battery. The blower motor will operate independently of the control switch, and current draw will be indicated on the ammeter.

3. Compare the current draw with specifications, approximately 12 to 16 amperes.

ELECTRICAL CONTINUITY TEST

This test will determine if current is supplied to the motor.

1. Turn the control switch on. Connect the clip of the test lamp to ground. Touch the prod of test lamp to the wires going to the motor. The test lamp should light.

2. If the lamp does not light, the trouble is before the motor. Check for: Blown fuse; defective control switch or wiring.

   Note: Do not overlook the possibility of a defective ground. Check for a loose screw in the ground wire eyelet, or corroded connection.

UNIT XIV - TESTING

Lesson I — Performance Test - (Road Test)

Tools needed: Thermometer

In order to determine if the air conditioning system is functioning efficiently, it may be desirable to drive the car, and check the air discharge temperature.

Note: If the car was parked in the sunshine and interior is very hot, drive car with windows open and allow time for normal cool-down. Proceed as follows:

1. Drive the car at a speed of forty MPH. Adjust the controls for maximum cooling.

2. Close the windows and vents tightly and install the thermometer at the air discharge duct.

Checking Temperature at Outlet Grille

Use the table as a guide and determine system efficiency.

Temperature outside Degree Farenheit	Relative Humidity	Discharge air Temperature Degree Farenheit
70	50-60	43
	90	45
80	50-60	47
	90	54
90	40-50	53
	60	58
100	25	55
	40	60

UNIT XIV - TESTING

Lesson 2 — How to Test System Pressure (engine off)

Tools needed: Gauge manifold, service valve wrench, tool kit.

In order to determine if the air conditioning system contains a refrigerant charge, the system pressure may be recorded and compared to the chart. This test refers to a vehicle that has been parked and the system not operating. Proceed as follows:

1. Connect gauge manifold to the service valves.

2. Record the pressure readings and compare them to the chart.

PRESSURE-TEMPERATURE RELATIONSHIP OF "FREON-12"

Temp. °F	Pressure	Temp. °F	Pressure	Temp. °F	Pressure	Temp. °F	Pressure
-8	5.4	30	28.5	68	67.5	106	128.1
-6	6.3	32	30.1	70	70.0	108	132.1
-4	7.2	34	32.0	72	73.0	110	136.0
-2	8.2	36	33.4	74	75.5	112	140.1
0	9.2	38	35.2	76	78.3	114	144.2
2	10.2	40	37.0	78	81.1	116	148.4
4	11.3	42	39.0	80	84.1	118	153.0
6	12.3	44	41.0	82	87.0	120	157.1
8	13.5	46	43.0	84	90.1	122	161.5
10	14.6	48	45.0	86	93.2	124	166.1
12	15.9	50	47.0	88	96.4	126	171.0
14	17.1	52	49.0	90	99.6	128	175.4
16	18.4	54	51.0	92	103.0	130	180.2
18	19.7	56	53.0	94	106.3	132	185.1
20	21.0	58	55.4	96	110.0	134	190.1
22	22.4	60	58.0	98	113.3	136	195.2
24	23.9	62	60.0	100	117.0	138	200.3
26	25.4	64	62.5	102	121.0	140	205.5
28	27.0	66	65.0	104	124.0		

If no pressure is indicated on the gauges, the system has developed a leak and is empty. It will then be necessary to:

1. Add a partial charge.

87 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963-A

2. Test the system for leaks and repair the leaks.

3. Replace the receiver drier.

4. Evacuate the system.

5. Charge the system.

Assignment:

1. What significance does the chart have in relation to safety?

2. Connect the gauge manifold to the compressor service valves and record the pressure.

3. Is the pressure normal? Inform your instructor.

UNIT XIV - TESTING

Lesson 3 — How to Test System Pressure (engine running)

Tools needed: Gauge manifold, service valve wrench.

The pressures existing in the high and low sides of the system, when compared to the manufacturers specifications, indicate whether the system is operating normally. Pressures will vary within a wide range due to variations in humidity and ambient air temperature.

Note: When testing system pressures, always refer to the manufacturer's specifications. Proceed as follows:

1. Connect the gauge manifold to the compressor service valves.

Gauge Connections for Pressure Tests

2. Start the engine and adjust the idle speed to 1500 rpm. Adjust the controls for maximum cooling and operate the system for fifteen minutes.

3. Record the pressure readings and compare them with specifications.

A "normal" pressure recorded on the gauges could be: Low Pressure: 30 PSI. High Pressure: 175 PSI. The important point to remember when testing system pressures is that the high pressure gauge should indicate six or seven times more pressure than the low pressure gauge. The following examples are given as an aid in diagnosing system malfunction.

Low Pressure	High Pressure	
30 PSI	70 PSI	System malfunction
10 PSI	250 PSI	System malfunction
40 PSI	270 PSI	System normal
25 PSI	160 PSI	System normal
18 PSI	85 PSI	System malfunction

Assignment:

1. State two reasons that could cause abnormally high pressure in the high side of the system.

2. State two reasons that could cause abnormally low pressure in the low side of the system.

3. Connect the gauge manifold to the compressor service valves and operate the system. Record the high and low pressures and advise your instructor if the pressures are normal.

UNIT XIV - TESTING

Lesson 4 — Trouble Shooting Guide

When trouble developes in the air conditioning systems, the procedures as listed below for the condition encountered should assist in locating the source of trouble.

Trouble	Procedure
SHORTAGE OR NO AIR DISCHARGE	
1. Discharge temperature high	Check air conditioner controls. Check for air passage restriction.
2. Low fan speed	Check for loose fan on blower motor. Test blower motor.
3. No fan operation	Check fuse to blower motor circuit. Check control switch. Check blower motor ground wire.
NOISE	
1. Scraping noise	Check for loose fan, or reposition fan on motor shaft. Check motor bearings and loose mounting.
2. Rattle and vibration noises	Check for loose air ducts, tubing contacts, loose compressor bolts, loose clutch.
WATER LEAKING INSIDE CAR	Check for evaporator drain tubes disconnected, kinked, or clogged.
FROSTING OR SWEATING OF EVAPORATOR	
1. Controls improperly adjusted	Refer to specifications; check all controls and adjust as required.
2. Shortage of refrigerant	Test system for leaks and repair leak. Charge system.
3. Restricted liquid line	Check line for kinks. Check receiver drier for stoppage.
4. Evaporator pressure control malfunction	Test control, adjust or replace as required.
5. Thermostatic switch malfunction	Test switch, adjust or replace as required.
6. Expansion valve malfunction	Test valve, clean screen, or replace.
7. Clutch does not disengage	Test clutch. Check thermostatic switch for contacts welded closed.
INSUFFICIENT COOLING	
1. System lost refrigerant charge	Locate leak and repair. Process system and check compressor oil level.

2. Clutch malfunction	Test clutch. Check for slipping belts. Check clutch slippage by observing bolt in compressor shaft. Bolt should turn at same speed as pulley.
3. Blower not operating	Check fan and blower motor.
4. Thermostatic switch malfunction	Test thermostatic switch. Check remote bulb for clean contact.
5. Evaporator pressure control malfunction	Test control, adjust or replace as required.
6. Compressor malfunction	Test compressor.
7. Clogged liquid line or receiver drier	Check for stoppage and repair as required.
8. Expansion valve malfunction	Test valve, clean screen or replace.
INTERMITTENT COOLING	
1. Freeze-up in high humidity areas	Raise low limit of STV or thermostatic switch. Replace EPR valve (Chrysler)
2. Expansion valve loss of remote bulb charge	Replace valve.
EVAPORATOR DISCHARGE AIR TOO COLD	Check evaporator pressure control device and thermostatic switch. Replace or adjust as required.
HIGH PRESSURE GAUGE READING EXCESSIVE PRESSURE	
1. Air in system	Test system for leaks, and repair as necessary. Evacuate and charge system.
2. Blocked air circulation through the condenser.	Clean condenser and straighten fins.
3. High engine temperatures	Test radiator cap. Test cooling system for leaks. Test radiator flow. Check engine for cooling system malfunction.
LOW-GAUGE READING ON HIGH SIDE OF SYSTEM	
1. Shortage of refrigerant	Locate leak. Evacuate and charge system.
2. Deflective compressor	Test compressor. Repair or replace.
LOW-GAUGE READING ON LOW SIDE OF SYSTEM	
1. Shortage of refrigerant	Locate leak. Evacuate and charge system.
2. Evaporator pressure control malfunction	Test control, adjust or replace as required.
3. Evaporator coils dirty	Clean coils with cold water.
4. Restriction in liquid line, suction line, or receiver drier.	Check lines for kinks and replace lines that are kinked. Check receiver drier, if clogged it will show frosting.
5. Expansion valve screen clogged.	Clean screen.

UNIT XIV - TESTING

Lesson 5 — How to Test a Radiator Cap

Tools needed: Radiator cap testor
Parts needed: A new radiator cap, a defective radiator cap.

A radiator cap that is defective will permit a loss of radiator coolant. This will result in higher engine operating temperature and reduce the efficiency of the air conditioner. To test the radiator cap proceed as follows:

1. Wet the adaptor and sealing gasket of the cap with water.

2. Install the cap on the adaptor.

   Note: The adaptor is made to accommodate long and short reach caps. The sealing gasket of the cap must contact the inside shoulder of the adaptor.

3. Assemble the adaptor to the pressure tester pump.

4. Stroke the pump plunger and attain a pressure reading on the dial for which the cap is rated. The cap should hold pressure and the dial reading should not fade. If the cap does not hold pressure, it is defective.

Radiator Cap Tester

5. If the cap holds the rated pressure, continue pumping and determine if the cap will relieve a higher pressure. If the cap does not relieve and holds a higher pressure it is defective.

Assignment:

1. State two cautions to remember when assembling the cap to the adaptor.

2. What would the result be to a car cooling system if the cap did not hold the rated pressure?

3. Practice testing a radiator cap. Your instructor will supply a good cap and a defective cap.

UNIT XV - TUBING

Lesson I — How to Cut Tubing

Tools needed: Tubing cutter, flaring tool, air gun
Material needed: 8" of copper tubing

A tubing cutter is used to cut a piece of tubing to the desired length, or to remove a defective flare.

1. The cutter consists of rollers for the tubing to rest on, a cutting wheel, a knob and screw feed, and a reamer for removing burrs. The rollers are made in a manner that permits removing a defective flare without waste of stock.

   By turning the knob clockwise, the cutting wheel is fed to the outside of the tubing under pressure. Rotating the tool around the tubing and tightening the knob results in a square cut.

To cut a piece of tubing proceed as follows:

1. Place the tubing cutter on the tubing and position the cutting wheel where the cut is to be made.

2. Tighten the knob until the cutting wheel contacts the tubing as shown:

SCREW THE CUTTING WHEEL LIGHTLY AGAINST THE TUBING

3. Apply pressure a *little at a time* and rotate the tubing cutter around the tubing until the cut is made.

4. Dress the end of the tubing with the flat side of the reamer. Insert the point of the reamer inside the tubing and rotate the reamer lightly in a clockwise manner. This procedure will remove burrs. Blow through the tubing with an air gun.

ROTATE THE CUTTER KEEPING A SLIGHT PRESSURE AGAINST THE CUTTING WHEEL WITH THE SCREW ADJUSTMENT.

Note: When the above procedure is performed to tubing that is part of the system, it will be necessary to disconnect the tubing at the opposite end in order to blow it out.

Assignment:

1. Name the parts of a tubing cutter.

2. What might happen if a tubing line that was part of the system were not blown out?

3. Cut a piece of tubing, dress the burrs, and show it to your instructor.

4. Flare the tubing and remove the flare. Ask your instructor to watch as you do this.

UNIT XV - TUBING

Lesson 2 — How to Bend Tubing

Tools needed: Bending spring
Material needed: 14" of copper tubing

The use of a bending spring makes it possible to bend tubing without collapsing or kinking. There are several types of tubing benders.

1. The spring type. The spring can be of the inside (Figure A), or outside (Figure B) type. Both serve the same purpose and are available in various sizes. The outside type is bell-mouthed on one end to aid installation.

Figure A

Figure B

2. The mechanical bender.

   For sharper bends with larger size tubing a mechanical bender is recommended.

BEND TUBING WITH AN OUTSIDE BENDING SPRING

1. Install the bending spring on the tubing and position it where you want the bend.

2. Grasp the bending spring and hold it with the thumbs extended as shown.

3. Apply pressure, slowly and evenly, bending to the desired shape.

4. Remove the bending spring by turning it in an attempt to unwind the spring. This makes it easier to slip the bending spring off the tubing.

Assignment:

1. Use a bending spring and bend a piece of tubing as shown in step 2. Show it to your instructor.

2. Straighten the tubing and bend it again without the bending spring. Show it to your instructor.

5887

Lesson 3 — How to Make a Double Flare

Tools needed: Flaring tool kit, tubing cutter
Materials needed: 6" of copper tubing

All tubing used in an air conditioning system with flare type connections must be double-flared. A double-flared connection results in a strong and leak-proof seal, and is recommended wherever a connection is subject to vibration. To make a double-flare, a flaring tool kit is used.

FLARING TOOL KIT

The kit consists of a flaring bar, a yoke and cone, and adaptors for various size tubing.

MAKE A DOUBLE-FLARE

1. Install the compression nut on the tubing. Place the tubing in the flaring bar. Snug the wing-nuts but do not tighten them.

2. Select the adaptor that fits the inside diameter of the tubing.

   Note: The adaptor has two purposes:

   a. To be used as a guide to judge the location of the tubing in the flaring bar.

   b. To compress the tubing and prepare it for the final flare.

3. Place the adaptor next to the tubing, with the stem facing up. Adjust the tubing in the flaring bar so that it is even with the top of the heavy stock of the adaptor. Tighten the wing-nuts securely.

4. Invert the adaptor and place the stem inside the tubing.

5. Place the yoke and cone over the flaring bar and locate the point of the cone in the center of the adaptor.

6. Turn the handle slowly and compress the tubing until the adaptor contacts the flaring bar.

Using a flaring tool on a piece of copper tubing.

7. Remove the yoke and adaptor and inspect the tubing. The tubing should be compressed evenly, ready for the double flare.

8. Place the cone in the center of the tubing and apply a drop of motor oil.

9. Turn the handle of the yoke, slowly, and tighten the cone.

   Note: Do not overtighten or attempt to double-flare in one operation. Back off the cone and inspect the depth of the flare.

10. Proceed and tighten the cone until an even seat of 45° is formed.

11. Inspect the inside and outside of the flare for cracks, and for an even and smooth seat. If the flare is defective, cut it off and make a new double-flare.

Assignment:

1. Name the parts of a flaring tool kit.

2. What is the purpose of the adaptor?

3. Why must the cone be tightened slowly?

4. Make a double-flare and show it to your instructor.

UNIT XV - TUBING

Lesson 4 — How to Repair a Hose

Tools needed: Gauge manifold, tool kit, vacuum pump, leak detector
Material needed: Splicer, two hose clamps, refrigeration oil, R-12

A refrigeration hose that is in good condition, but has been chafed or injured in a small area, may be repaired by installing a hose splicer.

Caution: Do not repair a hose that has dried out, shows sign of cracking, become oil soaked, or has ruptured under pressure.

To install a hose splicer, proceed as follows:

SPLICER

TEST SYSTEM PRESSURE

1. Connect the gauge manifold to the service valves and test the system for pressure. If pressure is present, discharge the system.

PREPARE THE HOSE FOR REPAIR

1. Remove the injured area of the hose by cutting with a single-edged razor blade. Cut the hose square as shown.

2. Inspect the inside of the hose for the presence of hose material.

Caution: Do not use your finger to clean the inside of the hose. If necessary, disconnect the hose and blow through it with an air gun.

3. Apply refrigeration oil to the inside of the hose.

INSTALL HOSE SPLICER

1. Install the hose clamps on the hose, loosely, and position them out of the way.

2. Apply refrigeration oil to the splicer, and push the splicer into the hose with a twisting motion, until the end of the hose contacts the locating bead.

3. Position the hose clamp over the splicer sealing beads and tighten the clamp.

   Note: The hose clamp tang is used to contact the locating bead, and position the hose clamp as shown.

4. Repeat the process and connect the remaining half of the hose.

RETURN SYSTEM TO SERVICE

1. Evacuate the system

2. Charge the system.

3. Test the system for leaks.

Assignment:

1. Why is it necessary to connect the gauge manifold and test the system pressure?

2. Why should you not use your finger to clean the inside of the hose?

3. What is the purpose of the locating bead?

4. Ask your instructor for a hose and splicer. Install the splicer and show it to him.

5893

UNIT XV - TUBING

Lesson 5 — Periodic Maintenance

It is recommended that periodic maintenance be performed in the spring of each year to insure that the air conditioning system will operate efficiently for summer driving. Proceed as follows:

1. Check all system component mounting bolts for looseness.
2. Check refrigerant hoses for deterioration and tighten the clamps.
3. Check the compressor crankshaft oil seal for leakage.
4. Inspect the compressor driving belts and adjust as needed.
5. Operate the system and check the temperature at the air discharge outlets.
6. Check the temperature at the inlet and outlet of the receiver drier.
7. Check the system for state of charge.
8. Check the system for leaks.
9. Check the vacuum hoses, at the control units, for deterioration.
10. Check the evaporator drip pan hoses for kinks or deterioration.
11. Refer to the manufacturer's specifications to determine if anti-freeze is required in the cooling system. If anti-freeze is needed check the specific gravity of the coolant.
12. Pressure test the radiator cap.
13. Check and clean the condenser.
14. Advise the car owner to operate the system for fifteen minutes in the winter to keep the seals pliable and the expansion valve from sticking.

GLOSSARY

Ambient temperature: The temperature of the air which surrounds an object on all sides.

Ammeter: An electric meter used to measure current. It is calibrated in amperes.

Ampere: A unit of electric current flow.

Atmospheric pressure: Pressure that the gases in the air exert upon the earth, measured in pounds per square inch. At sea level, this pressure is 14.7 psi.

Bellows: A corrugated cylindrical container which moves as pressures change.

Bending spring: A coil spring which is mounted on the inside or outside of tubing. Used to prevent kinks when shaping tubing.

Boiling temperature: The temperature at which a fluid changes from a liquid to a gas.

Bowden Cable: A tube containing a wire, used to control a valve from a remote point.

Calorie: The heat required to raise the temperature of one gram of water one degree centigrade.

Capillary tube: A small diameter tubing used to connect a temperature control bulb to a control mechanism.

Centigrade scale: The temperature scale used in the metric system. On this scale the freezing point of water is 0. The boiling point is 100.

Clutch field: The coils of wire through which the current flows to create the magnetic force that engages the clutch.

Clutch, magnetic: An electro-mechanical device attached to the compressor crankshaft, operated magnetically, which when engaged operates the compressor.

Cold: The absence of heat.

Compound gauge: An instrument used for measuring pressures both above and below atmospheric pressure.

Compression: A term used to denote an increase of pressure on a gas.

Compressor: The pump in a refrigeration system which draws a vacuum or low pressure on the cooling side of the refrigeration cycle, and compresses the gas into the high pressure or condensing side of the refrigeration cycle.

Compressor, reciprocating: A compressor which uses a piston and cylinder mechanism to provide pumping action.

Compressor seal: A leakproof seal located between the crankshaft and compressor body.

Condensate: Fluid which forms on the evaporator coils or fins.

Condense: The changing of a gas or a vapor into a liquid.

Condenser: The part of a refrigeration system which receives hot, high pressure refrigerant gas from the compressor, and cools the refrigerant gas causing it to change into a liquid.

Condenser comb: A comb-like device made of metal or plastic which is used to straighten the fins on condensers and evaporators.

Contaminant: A substance, such as dirt or moisture, foreign to the refrigerant or oil in the system.

Convection: The transfer of heat by means of movement or flow of a liquid or a gas.

Cracking a valve: To open a valve a small amount.

Cut-in: Temperature or pressure valve which closes a control circuit.

Cut-out: Temperature or pressure valve which opens a control circuit.

Cycle: A series of events which repeat in some order.

Cylinder head: The part which encloses the compression end of a cylinder.

Defrost cycle: The time period of a refrigeration cycle in which evaporator frost and ice accumulation is melted.

Dessicant: A substance used to collect and hold moisture.

Dew-point: The temperature at which a vapor - at 100% humidity - begins to condense and changes to a liquid.

Double flare: A tubing end which has been formed into two-wall thickness. A 37 to 45 degree bell-mouth or flare.

5896

Gauge Manifold set: A tool for testing refrigeration systems. It is composed of gauges, hoses, and a manifold with valves.

Ground wire: An electrical wire used to conduct electricity from an electrical component to ground.

Halide torch: A type of gas-burning torch used to detect refrigerant leaks.

Heat: A form of energy, the addition of which causes substances to rise in temperature.

Heat of Compression: The mechanical energy of pressure transformed into the energy of heat.

Heat transfer: The movement of heat from one body or substance to another. Heat may be transferred by radiation, conduction, convection, or by a combination of these three methods.

Hg (Mercury): A heavy silver-white metallic element; the only metal that is liquid at ordinary room temperature. Symbol, Hg.

High pressure gauge: A part of the gauge manifold set used to indicate pressures in the high side of a refrigeration system.

High side: That part of a refrigeration system which is under condensing or high side pressure.

Humidity: Moisture, dampness.

Hydrometer: An instrument used to measure the specific gravity of a liquid.

Idler: A pulley used on a belt drive to provide the proper belt tension and eliminate belt vibration.

Liquid indicator: A glass window located in the liquid line of a refrigeration system which provides an opening through which the flow of liquid may be observed.

Liquid line: The tube which carries liquid refrigerant from the condenser or liquid receiver to the refrigerant control mechanism.

Low pressure gauge: A part of the gauge manifold set, used to indicate pressures in the low side of a refrigeration system.

Low side: That portion of a refrigeration system which is under the lowest evaporating pressure.

Magnetic field: A space in which magnetic lines of force exist.

Oil, refrigeration: A specially prepared oil completely free of moisture and contaminants. It is designed to mix with the refrigerant and circulate in the system.

Orifice: An accurate size opening for controlling the flow of fluid in a refrigeration system.

Pressure: An energy impact on a unit area; the force or thrust exerted on a surface.

PSI: The symbol used to indicate pressure measured in pounds per square inch.

Pump down: The procedure of using a compressor or a pump to reduce the pressure in a refrigeration system.

Purging: Releasing compressed gas to the atmosphere in order to eliminate contaminants from a refrigeration system.

R-12: Dichlorodifluoromethane - a refrigerant known as Freon 12.

Radiation: The transfer of heat by rays.

Receiver-drier: A cylinder in a refrigeration system used to store liquid refrigerant. The cylinder also contains a dessicant.

Reciprocating: An action in which the motion is back and forth in a straight line.

Refrigerant: The chemical substance used in a refrigeration system which absorbs heat by a change of phase from a liquid to a gas.

Refrigerant charge: The quantity of refrigerant in the system.

Relative humidity: The ratio of the quantity of vapor present in the air, to the greatest amount possible at a given temperature.

Schrader valve: A spring loaded device which permits fluid flow in one direction when a center pin is depressed.

Service valve: A device attached to a refrigeration system which provides an opening for gauges and charging hoses.

Sight glass: A glass window located in a refrigeration system which shares refrigerant, oil, or gas bubbles in the liquid line.

Silica gel: A chemical compound used as a drier.

Specific gravity: The weight of a liquid compared to water which is assigned a value of 1.0.

Squirrel cage: A part of an air blower assembly driven by an electric motor. This design is more compact than a fan and directs air flow more efficiently.

Suction line: A hose or pipe used to carry the refrigerant gas from the evaporator to the compressor.

Superheat: The temperature of a vapor above the boiling temperature of its liquid state.

Teflon: A synthetic rubber material used for sealing; usually formed in O rings.

Temperature: The degree of heat or cold as measured by a thermometer.

Test light: A tool; a lamp provided with leads used to determine if current is flowing in an electrical circuit.

Thermometer: A device or instrument used for measuring temperatures.

Thermostat: A device which is responsive to ambient temperatures.

Torque: A force, usually described as a turning or twisting force.

Torque wrench: A tool; used to measure the amount of torque or pressure applied to a nut or bolt.

Vacuum: A reduction in pressure below atmospheric pressure.

Vacuum gauge: An instrument designed to indicate the value of pressure below atmospheric pressure, existing in a chamber or cylinder.

Vacuum pump: A mechanical device used to create a vacuum. A vacuum pump is needed to rid a refrigeration system of moisture and air.

Vapor: A term used to denote vaporized refrigerant; used instead of the term gas.

Viscosity: A term used to describe the resistance to flow by a liquid.

Voltage: A term used to indicate the electromotive force in an electrical circuit. It is voltage which causes current to flow.

Voltmeter: An instrument used to measure the amount of voltage existing in an electrical circuit.

Woodruff key: A device used to align and hold a pulley on a rotating shaft, usually usually half-moon in shape.

ACHIEVEMENT TEST

Unit I — Basic Principles

1. What does automotive air conditioning do?
2. What is normal body temperature?
3. How is normal body temperature maintained?
4. What is convection?
5. What happens when air is heated?
6. Heat travels to _____heat.
7. What is relative humidity?
8. What is evaporation?
9. How does cooling take place? State the <u>principle</u>.
10. What is the basic purpose of a refrigerant, as used in an automotive air conditioner?
11. Is R-12 flammable?
12. Is R-12 corrosive?
13. Draw a diagram, and show the major components of an automotive air conditioning system, in their proper location.

ACHIEVEMENT TEST

Unit IV — The Electromagnetic Clutch

1. What is the average field current draw of the clutch?

2. Draw a sketch and show how to connect an ammeter when testing the clutch.

3. When removing the General Motors clutch, must the system be discharged?

4. When removing the General Motors clutch, how is the hub and drive plate assembly removed?

5. State the caution to remember when removing the Chrysler clutch.

6. When installing the General Motors clutch coil housing, how can you be sure the housing is aligned properly?

ACHIEVEMENT TEST

Unit VI — Service Valves

1. How is a Schrader valve "cracked"?

2. How do you back seat a Schrader valve?

3. State the caution to remember when connecting the adaptor to a Schrader valve.

4. How many inches of vacuum can be indicated on the compound gauge?

5. How many PSI of pressure can be indicated on the high pressure gauge?

6. How is the center inlet-outlet part of the gauge manifold used?

7. Is a service valve wrench needed when connecting the gauge manifold to a Schrader valve?

8. How is air purged from the gauge manifold and hoses?

9. State the caution to remember when connecting a can tap to a 1 lb. can of R-12.

10. In what direction would you turn the valve on the can tap to pierce a 1 lb. can of R-12?

ACHIEVEMENT TEST

Unit VII — Basic Service Procedures

1. Draw a schematic and indicate the gauge manifold connections to the service valves when discharging the system.

2. Why should the air conditioner be operated at an engine speed of 1500 RPM before discharging the system?

3. Why is it not recommended that alcohol or methanol be added to the system to prevent freezing of moisture?

4. What is meant by the term vacuum?

5. When evacuating the system, state the procedure to follow if a vacuum of 28HG was not reached.

6. How is the reactor plate of the leak detector tested?

7. Why is it important to keep a container of R-12 upright when charging the system?

8. How can you determine that a 1 lb. can of R-12 is empty?

9. How can a compressor equipped with Schrader valves be isolated?

10. When should the oil level in a Chrysler compressor be checked?

11. Why should the oil level in a York compressor be checked after collision damage to the system?

12. How often should the oil be checked in a General Motors six cylinder compressor?

ACHIEVEMENT TEST

Unit X — The Receiver Drier

1. How can liquid refrigerant be "stored" in the receiver drier when it is subjected to high pressure?

2. How can normal leak down be kept at a minimum?

3. Why does silica gel absorb moisture?

4. Describe the procedure to follow if evidence of sludge was found in the compressor.

5. State two methods of checking for a clogged receiver drier.

6. How could bubbles appear in the sight glass when the system is fully charged and the temperature of the surrounding air is below 70°F?

ACHIEVEMENT TEST

Unit XII — The Evaporator

1. State a caution to observe when undercoating a car equipped with an air conditioner.

2. How is operation of the STV controlled?

3. When testing the STV where is the low pressure gauge manifold hose connected?

4. How many inches of vacuum are present in the vacuum hose to the STV?

5. In what direction is the vacuum unit of the STV turned to raise the pressure in the evaporator?

6. How is the STV Bowden control cable adjusted?

7. When testing the ERP valve, how is the heat load on the evaporator reduced?

8. What is the correct suction pressure maintained by the EPR valve?

ACHIEVEMENT TEST

Unit XIII — The Electrical Control System

1. What is a rheostat?

2. Name the two circuits that are energized when the air conditioner control switch is turned on.

3. Why does the blower motor continue to run when the clutch is cycled off?

4. We learned that the thermostatic switch operates on a 6° air temperature differential. Where is this differential?

5. Where is the thermostatic switch capillary located?

6. Describe the testing procedure used to locate a defective thermostatic switch.

7. Draw a schematic and show how you would connect an ammeter in series to the clutch.

8. How do you know when the contacts in the thermostatic switch are fused together?

9. How would you check the blower motor ground?

10. What are the blower motor current-draw specifications?

STATE OF OKLAHOMA
OFFICE OF THE GOVERNOR
OKLAHOMA CITY

DEWEY F. BARTLETT
GOVERNOR

In 1968 the State Air Education Committee, chaired by the State Superintendent of Public Instruction, was appointed to study the Oklahoma educational program in aviation and aerospace. As a result this committee held an Aerospace Education Workshop in the summer of 1969 for the teachers of Oklahoma. The participants of the Aerospace Education Workshop developed this material for the first Aerospace Education Curriculum Guide for grades kindergarten through twelve. Another Aerospace Education Workshop is planned for the summer of 1970 when a further revision of this guide will be made.

The aerospace industry is the third largest and fastest growing industry in Oklahoma. Many of our young people will choose their careers in this dynamic field and, I hope, earn their living in this great state.

This Aerospace Education Curriculum Guide is a step forward for our educators. This material will assist them with their many students who have an interest in this area.

As Governor of Oklahoma, I urge all educators in the State of Oklahoma to include aerospace education at every academic level and in every field of study with the opening of our schools in September, 1970.

We are grateful to the leadership shown by the State Department of Education, the Oklahoma Aeronautics Commission, and to all of those who have made contributions to this booklet.

Dewey F. Bartlett
Governor

5911

FOREWORD

The special Air Education Committee appointed in 1968 by Governor Dewey F. Bartlett resulted in the Oklahoma Aerospace Education Workshop in the summer of 1969. This guide was prepared by the teachers participating in the workshop, consultants, and other educators and is designed to assist teachers in teaching aerospace education. Its purpose is to assist teachers to incorporate aviation and space matters in their daily teaching so that their students will become more aware of these dynamic industries.

We all recognize there is a growing national interest in capitalizing on the motivation that aviation and aerospace studies provide for students as well as teachers. As one who has participated actively in both aviation and aviation education, I commend the Oklahoma educators at the local and state level for the imagination and initiative in developing this curriculum guide in Aerospace Education.

The State Department of Education gratefully acknowledges the contributions of the State Committee and Subcommittees of the Oklahoma Curriculum Improvement Commission, and especially to the Oklahoma Aeronautics Commission for their support of this project.

The State Department of Education takes pride, in behalf of all those who have had a share in producing it, in offering this guide to the teachers of the State of Oklahoma for reference, and for suggestions on how they may enhance their effectiveness in the fine art of teaching. I am confident that the excellent materials contained in this booklet will be of great value to all schools of the state that seek to use them to suit local needs objectively and professionally.

Scott Tuxhorn
State Superintendent of Public Instruction

FAMILY FLYING FUN

TO THE TEACHER:

All of us recognize the great interest that our students have in aviation and space activities. The motivation to learn more in this field, and to feel a part of this exciting activity, is already high among our youth. The purpose of this book is to provide information and to help the teacher who wants to accomplish the goals of education. The teacher wants to insure that the student's learning activities are both effective and efficient. The materials available are of such variety and from such diverse sources that obtaining and evaluating these requires excessive amounts of time and effort for the interested teacher.

This curriculum guide contains listings and examples of the many current publications and other resources available, and has classified them according to subject matter and grade level. The teacher who wants to establish an aerospace oriented course of study will find many examples here of courses that have been developed in recent years and which can be used as models. The teacher who desires to incorporate a unit on aviation or space can find in this guide many illustrations graded for applicability to specific age groups.

5916

WHAT IS AEROSPACE EDUCATION?

Aerospace education is that branch of general education concerned with communicating knowledge, skills, and attitudes about aerospace activities and the total impact of air and space vehicles upon society. It must be distinguished from those branches of special education known as aeronautical and/or astronautical education which are concerned with training specialized aerospace workers.

5917

INTRODUCTION

We feel that the public schools in the State of Oklahoma should make every effort to include aerospace education in every subject.

It is recommended that high schools introduce a separate course in aerospace education in addition to integrating it into all subject matter areas.

PHILOSOPHY

This program should be implemented in such a manner that the teacher has the freedom to utilize that amount of time and content deemed expedient or important in this area.

It is further believed that the teacher should have a pragmatic awareness of the subtle relationships and nuances between aerospace education and the total curriculum.

It is desirable that the program include grades K-12.

Finally, it is recommended that the content utilize all of the materials, aids, and resources as possible.

GENERAL OBJECTIVES

1. To develop an awareness of the needs and implications of aerospace education and its impact on our society.
2. To seek to integrate aerospace education with all classroom activities.
3. To motivate and stimulate pupils' interest in and understanding of the scientific and social advancements being made by mankind as a result of aerospace research and development.
4. To develop the abilities to speak and write about aerospace education in a meaningful manner.
5. To motivate the child's interest in aerospace education through all subject matter areas.
6. To create an interest and appreciation on the part of the child for aerospace literature and related materials, and to assist him in the interpretation of these.
7. To prepare all students so that they may participate in a society strongly influenced by the growth of aviation and space exploration.
8. To furnish all students opportunities for career exploration in aerospace.
9. To provide a flight experience for all students.
10. To provide some students aviation ground school and/or vocational and technical training in aviation skills.
11. To establish a collection of aerospace materials available to both school and community.

Activities

Experience Chart

1. From class dictation write simple chart stories about the planets.
2. From class dictation write simple chart stories about the satellites.
3. From class dictation write simple chart stories about the solar system.
4. From class dictation write simple chart stories about the moon.
5. From class dictation write simple chart stories about the moon, the solar system, and the stars.
6. From class dictation write simple chart stories about the United States' space program.
7. From class dictation write simple chart stories about airplanes.
8. From class dictation write simple chart stories about a trip on an airplane.
9. From class dictation write simple chart stories about air and gravity.
10. From class dictation write simple chart stories about a trip to the moon.
11. From class dictation write simple chart stories about why I would like to go to the moon.
12. From class dictation write simple chart stories about how I would feel in space.

Written

1. Write stories about the solar system.
2. Write stories of space travel.
3. Write stories of the United States' space program using pictures.
4. Write stories about the lives of the astronauts.
5. Write stories about how an airplane flies.

Dramatic Plays

1. Dramatize the launching of a satellite.
2. Dramatize a trip on an airplane.
3. Dramatize a trip in space.
4. Dramatize the story of a space pilot.
5. Dramatize the life of a space traveler.

Reading

1. Develop a picture dictionary of aerospace vocabulary.

Content Area	Activities
Arithmetic	Number Experiences 1. Compare the size of the planets to the size of known objects. 2. Countdown the launching of a satellite. 3. Compare the size of the planets to the size of the earth.
Music	Rhythm 1. Imitate the feeling of floating in space. 2. Imitate the movements of an airplane with music background. 3. Imitate the different kinds of airplanes with music background.
Social Studies	Social Studies 1. Have children bring pictures in the news about the astronauts.
Science	Science

1. Place a hard-boiled egg (shell removed) on top of an empty quart milk bottle. The egg cannot be pushed through the bottle without exerting force. Remove the egg and insert a flaming torch made from a piece of rolled-up paper into the milk bottle. Quickly place the egg back on top of the bottle. Why did this happen?
2. Fill a glass to the top with water. Place a card on the top of the glass larger than the diameter of the glass. Holding the card firmly on the glass, quickly turn the glass over. Remove your hand from the card carefully.
   CAUTION: Perform this experiment over a pail or similar container.
3. Submerge a tumbler and allow it to fill with water. Turn it to an inverted position and lift it straight up until nearly all of the glass is above the water. Tell why H_2O would not run out of the tumbler.
4. Obtain two plumber's force cups and wet the bottom rim of each cup. (Two suction cups of equal size may be used instead.) Press the cups together to expel the air inside the cups. When you try to pull them apart, you may find this to be very difficult. Why?
5. Make a nail hole near the bottom of a small sized tin can. Fill the can with H_2O, hold the palm of the hand tightly over the top of the can, and the water will stop flowing from the hole. Lift the hand and the water will start to flow again. What can account for the stoppage of water?

6. Place a drinking straw in a full bottle of water. Press clay around the neck or close the opening between the straw and the bottle. Hold the clay tightly to the bottle with your fingers and try to drink through the straw.
7. Insert a glass tube into a one-hole stopper. Insert the stopper into a soda pop bottle completely filled with water. Suck on the tube and try to get a drink of water. Loosen the stopper and try again.
8. Show that air pressure on a parachute slows the fall of an object. Make a parachute from a piece of cloth. Drop an article without parachute attached, then with parachute attached.
9. Make model rockets from clay.
10. Grow plants with and without light.
11. Throw ball into air; discuss why it always comes down.
12. Shine flashlight on turning ball to demonstrate night and day.
13. Make parachutes of large handkerchief. Tie object to it. Observe how air slows the fall of object.
14. Make kites and fly them.
15. Keep daily weather chart with comments about "good" flying weather.
16. Fasten inflated balloon to small lightweight toy so that when air is released toy will move forward.
17. The "pop bottle" barometer shown in the diagram will indicate changes in pressure only if it is kept at uniform temperature. If the temperature is allowed to vary, it will operate on the same principle as a thermometer. Discuss the reasons for this.
18. Make a simple anemometer like the one shown in the diagram. Note the behavior of the vanes when the device is held in the wind or in front of an electric fan. Point out that commercial anemometers have a registering device that works like a speedometer on an automobile.

AIM: While continuing the interest in *Man in Space* — being alert to any new developments in the space program, a study of the Nature of the Universe, would be appropriate, beginning with the solar system, then going into the study of related subjects such as geology, weather, biology and botany.

Concepts To Be Developed	Activities	Resources
There are nine planets rotating around the Sun. This is called the Solar System The planets in order are: Mercury Venus Earth Mars Jupiter Saturn Uranus Neptune Pluto	Learn the names and order of the planets, using a nonsense quotation to help: "Many Vicious Elephants Move Jungles Searching Unfriendly Native Parties"	Room Environment: 1. Pictures of the planets showing their order 2. A globe of the Earth 3. A model of the Sun with the Earth rotating around it.
The earliest man was interested in the heavens above. The first tool for observing the stars and planets was a pair of eyes	*Science:* Begin keeping a Moon chart, showing the changes of the Moon	
	Language: Dictionary work— Begin building a working vocabulary on the Solar System. The following words should be defined and added to each child's Space notebook: astronomy comet galaxy gravity light-year lunar orbit meteor meteorite solar universe	

5923

Concepts To Be Developed	Activities	Resources
	Math:	
The Earth is a ball nearly 8,000 miles across.	Work on comparisons in distance and size, practice reading large numbers and discuss scaled measurement.	
	Science:	
The Sun is 109 times greater than the Earth.	Count out 109 BB's. Draw a straight line across a large sheet of paper. Spread glue on the line. Make sure the BB's touch one another. Draw a large circle around it. Imagine the circle to be the Sun, the BB's to be planets the size of the Earth.	

The planets vary in size. Jupiter is the largest. Pluto, the smallest.

Planet	*Diameter*	*Scale Measurement*
Mercury	3,000	1 inch
Venus	7,600	2 1/2 inches
Earth	7,900	2 3/4 inches
Mars	4,200	1 1/2 inches
Jupiter	87,000	2 feet & 5 inches
Saturn	71,500	2 feet
Uranus	29,500	10 inches
Neptune	27,000	9 inches
Pluto	3,600	1 1/4 inches

Using the scale measurement on page 7 cut pictures of each planet to show comparison in size.

Art:

Sunset Scenes — Cut and paste windmills, birds, planes, etc. from black construction paper. A silhouette effect is achieved by pasting the pictures on white paper, 8" by 12". Blend in sunset colors using colored chalk.

Film: *What Makes Night and Day?* Elementary Science Series, Young American Films, McGraw-Hill, Inc.

Concepts To Be Developed	Activities	Resources
Everything we do takes up space Heat energy from the sun travels through millions of miles of space to get here to warm the Earth. Early man identified outlines of imaginary figures in the sky formed by groups of stars called constellations. The Greeks began charting the stars		Film: *What Is Space?* Prod — EBF Dist — EBEC Encyclopaedia Britannica Films
Early man made guesses about the Universe and was sometimes wrong.	Discuss, on a simple level, the work of Aristotle—how people accepted and believed his ideas regarding an Earth-centered-Universe.	Film: *How Do We Know The Earth's Shape?* Film: *How Do We Know The Earth Moves?* Film: *How Many Stars?* Prod—MIS Dist—MIS Moody Institute of Science Educational Film Division 17000 E. Washington Blvd. Whittier, California 90606
Most of the planets are named for Greek and Roman mythological characters.	Read aloud each day for a determined length of time. Make picture dictionaries for a *Language* assignment. Show the following gods and goddesses: Athens—wisdom Apollo—sun Diana—moon Neptune—sea Mercury—messenger Venus—love Mars—war Jupiter—king of all the gods	*Stories of Gods and Heroes* adapted by Morris Schreiber
Three gods rode in chariots: Apollo's chariot was pulled by horses, Diana's by hounds, and Neptune's drawn by seahorses. The Olympic Games were begun in ancient Greek times.	*Art:* Make cut-outs of these three mythological characters. Paste black construction paper *Language:* Read to the class about the history of the Olympics *P.E.* Work at some track events —50 yard dash, 600 yard walk-run, standing broad jump *Math:* Mark field, using measurement Practice using stop watch	*The First Book of the Olympic Games* By John Walsh Film: *Track and Field* — Narrated by Bob Mathias Prod—UWF Dist—UEVA United World Films

Concepts To Be Developed	Activities	Resources
	Health:	
When an athlete is in training, he eats well and gets plenty of rest and exercise. He doesn't smoke.	The nurse might come in to discuss with class a good health program The children are tested in the "step-up-step-down" test to see if they can qualify for the physical fitness training and testing required by the state	
	Geography:	
Columbus helped to clear up a misconception of long standing. That the Earth was flat	Review the continents and discuss the discovery of North and South America	
Copernicus followed Columbus and set forth the idea of a sun centered universe. His ideas were ridiculed	Discussion	
Galileo was an Italian who accepted Copernicus' ideas about the universe Unlike Aristotle, Galileo accepted as true only what he could prove	Read aloud and discuss the life of Galileo	*Galileo* Author: Gregor A. S. Scribner, 1965. Grades 2-7
	Science:	
	Read about and discuss Galileo's laws of falling objects. Take turns dropping a light and a heavy object simultaneously to determine whether one would fall to the ground first.	
	Social Studies:	
A heavy object and a light object, when dropped at the same time, fall to earth simultaneously. B.C. means Before Christ A.D. means Anno Domimi, in the year of our Lord	Make a timeline to be placed on the bulletin board. Have the children draw pictures and place them at the proper date. Begin with John Glenn's flight and work backwards, adding to it during the year	
Galileo developed the telescope, which paved the way to more accurate study of the universe	Discuss the difference between Galileo's telescope and the telescope at Mount Palomar.	

AEROSPACE ART

Draw or paint pictures of a space pilot.

Draw or paint pictures of a moon station.

Draw or paint pictures of the "man on the moon" or other figures imagined on the moon.

Draw or paint pictures of a trip to the moon.

Make a glider or airplane out of paper.

Build an airplane out of blocks.

Build an airport with blocks.

Draw or paint different kinds of clouds.

Draw or paint pictures of different kinds of airplanes, then make them into a mural.

Build a space capsule with blocks.

Draw or paint pictures of planets.

Draw a picture of a moon station.

Draw or paint pictures of space adventures.

Draw or paint pictures of rockets.

Make a rocket of cardboard tubes. Make an oatmeal-box capsule for a monkey, using clay and cotton to fit and pad it.

Make clay monkey to fit into the capsule.

Draw or paint pictures of the moon in phases.

Draw or paint pictures of the moon. Show the surface in the detail.

Make a picture book of different kinds of airplanes.

Make silhouettes of common kinds of airplanes. Use them as flashcards.

Have an exhibit of model airplanes.

From sturdy boxes, make an airplane large enough for the children to get into.

Construct a table-model airport.

Draw or paint pictures illustrating the history of ballooning.

Draw or paint pictures of satellites.

Draw or paint pictures of space travel or of what might be seen in space.

Build a table-model rocket base.

Draw or paint moonscapes.

Make imaginary moonscapes using clay.

Make gravity pictures with string dipped in tempera paint. Place the paper on the floor and allow the string to fall where the gravity will cause it to fall.

Make a paper-bag space helmet.

Make oatmeal-box oxygen tanks.

Build a table model of a space station.

Construct a large table-model Mercury capsule using chicken wire for framework. Cover it with aluminum foil. If possible make it large enough for a child to get into.

Make a mural of our galaxy in space, showing approximate location of our solar system.

Draw or paint pictures of space vehicles.

Construct dioramas of an airport.

Make balloon models and use as mobiles.

Draw landscapes of the major planets.

Make paper models of satellites. Hang them as mobiles.

Build a table model of Cape Kennedy.

Make imaginary "moonscapes" with clay.

Make a three-dimensional map of the moon.

Make papier-mache models of the planets.

Build a model Nike base.

Make a table-model lunar vehicle.

Make clay models of different kinds of rockets, missiles and satellites.

Make diagrams of rocket and jet motors.

Make a three-dimensional map of the moon.

Prepare a mural of the history of flight.

Make models of historical airplanes.

Dress a doll in a model space suit.

5928

Aerospace Activities

Secondary Level

HOME ECONOMICS IN AEROSPACE

When man ventures into the hostile environment of space, he must take with him all the things he needs to keep him alive and comfortable: food, clothing, shelter, even the air he breathes and the water he drinks. For protection during space flight, the astronaut must have a spacecraft especially designed to shelter him from the hazards of space. He also requires a spacesuit which can be pressurized to protect him during extravehicular activity or in such cases of spacecraft pressure failure. For body energy, he must have food that is highly nutritious and especially prepared to be handled and eaten during the conditions encountered in space flight.

There are several aspects of space that make sustaining life a more complex process than it is on the surface of Earth. The factors to be considered are vacuum or total absence of air, a lack of atmospheric pressure, a lack of oxygen, weightlessness or zero gravity, ionizing radiation from solar flares which can be more deadly than the radiation of a nuclear bomb, and micrometeoroids that could penetrate the surface of the spacecraft. In addition, there are extremes of heat and cold much greater than those encountered on earth. Temperatures on the surface of the moon vary from a minus 243 degrees F. in the dark areas to plus 212 degrees F. in direct sunlight. This is the type of environment in which man must live and work as part of space exploration.

The environment to which man is normally accustomed is that of earth's gravity and atmospheric pressure. To survive extremes outside of these conditions, an adequate environment must be provided. The spacesuit can provide a suitable environment in addition to that provided by the environmental control system of the spacecraft.

The spacesuit designed for the crews of NASA'S spacecraft, consists of four layers which fit loosely inside one another. The layers are fastened together only around the boots, the zipper, the connections for the oxygen hoses and the medical instrument wires. The garment, complete with helmet and boots, weighs approximately 30 pounds.

The outside layer is made of a high temperature resistant white nylon. Beneath the outer layer is the restraint garment, so called because when the suit is inflated, it keeps the suit from billowing. It is woven of nylon net fabric and designed to allow mobility when inflated. The third layer is treated with rubber to make it almost airtight. The innermost layer is a smooth soft nylon layer designed for comfort.

The spacesuit is designed to provide safe protection against vacuum, heat, and cold. This suit is primarily an intravehicular suit and affords little if any micrometeorid protection. The spacesuit is designed as a backup to function in the event of pressure failure.

5930

Air inlet and outlet connections are located on the torso of the suit at waist level. A near 100 percent breathable oxygen system is provided to the suit from storage bottles.

Two pockets, one located between each knee and ankle, hold tools for opening food packages during flight and for cutting parachute lines if necessary on landing. Two large shin pockets are provided for flight plan data storage.

Accessories — Gloves are attached to the suit at the wrist with quick disconnect couplings. A small battery pack and two fingertip lights are mounted on each glove. This provides a small light source the astronaut needs when reading spacecraft instruments while on the dark side of the Earth.

The helmet has a built-in drinking port through which the astronaut can insert the nozzle of a "water gun" into his mouth without removing the helmet. The helmet provides visibility, comfort, and windblast protection. The communication system consisting of ear phones and microphones is an integral part of the helmet. Disconnect couplings also attach the helmet to the suit to facilitate removal or donning.

Three Suits for Each Astronaut—Primary crews are provided with three suits. All suits, including the boots, gloves, and helmets, are individually tailored. One suit is for training, a second for the actual mission, and the third is provided as a backup.

Since the water supply on a spacecraft is limited, the manner of shaving, brushing teeth, and bathing must be changed.

A shaver operated by a spring motor, like a windup toy train is used. It has a built-in vacuum cleaner that collects the cut whiskers—which otherwise might float around getting into eyes and noses or fouling instruments because of the weightlessness and zero-gravity atmosphere.

For teeth brushing, they may either use a chewing gum something like one which now advertises its tooth cleaning as well as pleasant taste or a toothpaste which is treated so that it is edible. The astronaut eats the used dentifrice instead of spitting it out.

For "washing up," they'll use a chemically impregnated near-lintless cleaning tissue, to prevent water droplets and lint from fouling the instruments.

Regarding physical activity and sleep, the astronauts have no room to stand up straight or lie out flat for rest. The spacecraft limits their movement because of a need to conserve space. Exercise routines are done by isometrics.

HOME ECONOMICS

OBJECTIVES

1. The student will describe how mans' environmental needs are met in space flight in terms of seven atmospheric conditions (such as: weightlessness, lack of oxygen, etc.); on type of clothing; three personal hygiene and fitness habits (such as: shaving, brushing teeth, and bathing); two sanita-

tion procedures; and three problems encountered in providing an adequate diet (such as weight load on the spacecraft, the weightless condition of space, and low residue for waste disposal).

2. The student will be able to list eight physical changes (such as: cardiovascular, muscular, and skeletal changes due to weightlessness, negative calcium balance, dehydration, negative nitrogen balance, etc.) which could take place in the human body due to living in a spacecraft.
3. The student will explain the main use of a low-residue diet as it relates to waste disposal on a spacecraft; the lowered caloric requirements as affected by physical activity on a space craft; and adequate levels of carbohydrates, fats, protein, vitamins, minerals, and water as a necessity for optimum astronaut nutrition.
4. Given a list of foods, the student will plan a nutritious meal by selecting only those which are low-residue foods.
5. The student will prepare a low-residue meal and evaluate texture, flavor, appearance, juiciness, and acceptance on a nominal scale.
6. The student will describe in detail the one main method of dispensing water on a spacecraft for drinking and food reconstitution.
7. The student will be able to name and describe in general the types of diets under investigation for long duration flights and their feasibility.
8. The student will list eight current techniques of food processing used in the food industry and one example of a food characterized by each technique.
9. The student will name and describe in general how food for the future may be obtained from oceans and lakes and from organic and inorganic substances.

ENERGY REQUIREMENTS FOR VARIOUS ACTIVITIES DURING SPACE FLIGHT

Activity	Time (hour)	Energy Expenditure Rate Cal./Min.	Total Performance Calories
Sleep	7	1.2	504
Quiet sitting or standing	12	1.5	1080
Instrumentation	2	1.8	216
Complex neuromuscular tasks	2	2.6	312
Moderate work	1	7.0	420
			2532

The diet contains about 150 grams of fat, 310 grams of carbohydrate, and 80 grams of protein for a total of 2800 calories. The urine volume on this diet would be about 800 milliliters per day. The fecal losses are minimized by the use of low-residue foods. The diet contains about five per cent crude fiber and results in an average daily output of 80 to 85 grams of feces. Three liters of water per day are included with this diet. Since astronauts are busy and preoccupied, water intake must be programmed into the daily schedule. Salts to provide levels about 10 per cent above earth allowances are added to provide calcium, magnesium, potassium, and sodium. Liberal allowances of ascorbic acid and Vitamin E are included. Other vitamins are provided on the basis of the recommended allowances.

NUTRITIONAL NEEDS ON LONG DURATION FLIGHTS

Environmental conditions in space such as weightlessness, heat and cold, wearing of pressurized suits, inactivity, and cabin temperature may produce more definite changes in nutrient requirements on long duration flights.

On long-term space travel, the effect of prolonged inactivity could cause a negative nitrogen balance. Also, a prolonged constant cabin temperature could lower the basal metabolic rate thus lowering the energy requirements of man.

The sweating process plays an important part in determining energy requirements of men exposed to solar radiation or high temperatures. Considerable nitrogen is lost in sweat. An increase in protein is necessary under conditions that produce a great deal of sweating.

Another change in nutritional needs may be due to the continuous wearing of pressurized suits for extended flight explorations. A diet of precooked freeze-dried foods seems efficient in supplying the necessary nutrient requirements. During periods of inactivity, while wearing the pressure suit, there is no need to increase the nutritional requirements. However, during periods of exercise, both water and energy requirements need to be increased.

The water requirements for long duration space flights are very important. Both caloric requirements and water requirements are strongly affected by physical activity, thermal environment and clothing. As a minimum, two liters of fluid should be provided daily with provision for additional water, if necessary. Of this amount, one to one and one-half liters become urine and one liter becomes water vapor, leaving the lung surfaces and the skin as "insensible" perspiration. If any visible perspiration occurs, the water requirement may rise to many times the basic value. Even if there is no visible perspiration, as in the hot, dry desert, water needs rise sharply with the temperature. Some water is made from food that is eaten. In the metabolism of carbohydrates such as sugar, about one gram of water is formed for every gram of food.

The dietary recommendation of long duration space flights is that the diet be as simple as possible with the maximum use of natural foods. The diet preferred is a liquid formula or one which can be reconstituted to liquid or semi-liquid form. The caloric requirements for a 150 pound man should provide 2700 to 3200 calories per day of which 12.5 per cent are protein, 52.5 to 57.5 per cent carbohydrate, and 30 to 35 per cent fat.

Evolving from this new interest in nutritional needs for space travel has been a new technology entitled Gastronautics. Gastronautics is "a new interdisciplinary technology—astrophysiological dietetics—regulation of diet consistent with the normal functioning of an organism beyond the earth environment."

Packaging of Foods for Flight — Early space feeding was mainly that of serving liquids and semi-solid foods from collapsible squeeze tubes. These tubes were like aluminum toothpaste-type tubes with a nontoxic food grade organic inside coating. These special coating materials were applied to the inner surface of the aluminum tubes to prevent formation of hydrogen gas, which would have resulted from reaction between the metal and the acids in certain foods, such as applesauce. Precision filling and sealing techniques were devised to eliminate any trapped gasses which might expand and rupture the container when the pressure in the spacecraft cabin was reduced. A new gasketing material was developed to increase protection against leakage or spoilage during storage. Special in-the-tube sterilization techniques were also employed to preserve the contents. The average tube of food weighed 5½ ounces, with the aluminum tube accounting for a large proportion of this weight. The weight of the tube in proportion to the weight of the food was considered to be too high, but subsequent development of a lightweight plastic container helped to overcome this problem.

The food in these tubes is transmitted to the mouth of the astronaut by applying pressure to the tube. The food is fed into the mouth through a three and one-half inch polystyrene pontube which screws onto the aluminum tube and cuts open the tube when it is attached. During space flights, when the space suit may not be pressurized, the face plate can be opened to allow the food to be squeezed directly from the tube into the mouth. But if the space suit is pressurized, the pontube must be used and it is inserted into an opening in the face plate of the suit.

For foods which need reconstitution with water, a package was designed with an enclosed aesceptic tube which extends to submit water and through which the food was directly fed into the mouth. This packaging was transparent to enable the astronauts to identify the foods. This laminate was developed to provide adequate heat sealability, very low water vapor permeability to protect foods against moisture pick-up and oxidation, and durable enough to meet the stresses of reconstitution of foods.

The sandwiches, bacon and fruit cake packages were provided with a pull-tab arrangement for dispensing the food. The dispenser for bite-size pieces was made of Plexiglas and contained a pull-tab and a closure flap of polyethylene. The astronauts removed the bite-size pieces by hand and placed them directly in the mouth while the face plate was open. In the early flights, a water-proof polyethylene mitten was worn over the pressure suit gloves for sanitation purposes.

FOOD CONCEPTS FOR LONG DURATION FLIGHTS

Long duration space flights have been considered to be of three months duration or longer. Weight, storage, waste disposal, and water supply will be of prime concern on these flights. In order to minimize storage and weight, several types of diets have been proposed.

5934

Investigated Diets

Taking an energy pill instead of eating a meal is more like science fiction. Mealtime is an important part of the day for the astronauts in order to avoid monotony. The energy pill concept, not highly favored, would require 90 large size capsules for the protein, minerals, and vitamins and 250 capsules in the form of fat to provide 2200 to 2500 calories per day. The psychological and physiological aspects of consuming such a large number of pills per day almost rules out this concept.

Another proposal is to increase the body weight of the space traveler before flight and he will then utilize this increased fat during space flight. This would be similar to a semi-starvation diet. The psychological aspects of this semi-starvation diet make it nonacceptable.

A third diet concept is the use of liquid formula diets containing chemicals for a well balanced diet. The levels of all nutrients must be adequate if it is to be used as the only food source. This diet provides 20 to 40 calories per fluid ounce. The advantages of this diet are that it would shorten food preparation time and provide sterile food.

Synthetic diets for space programs have also been studied. The chemical diet consists of proportions of L-amino acids, the required water-soluble and fat-soluble vitamins, pertinent salts, glucose and ethyl linoleate as the source of essential fat. Only distilled water may be added to the diet. Studies on this diet have demonstrated that there were no adverse physiological or psychological effects. The physical status and psychological outlook after consumption of the diet was good. Fecal residue was strikingly reduced. The major advantage of this diet is that one cubic foot of the diet will provide a 154 pound astronaut with all the required nutrients and 2830 calories per day for one month. In addition, this synthetic diet is completely water soluble, low in bulk, completely digestible, and has good storage stability.

Each day, an average man requires, in addition to about 2 lb. of oxygen, almost 7 lb. of water, and approximately 2 lb. of food. This is his intake. His output consists of about 2½ lb. of carbon dioxide, almost 8 lb. water, and just a small amount of solids, urea, and minerals. Thus, he consumes the equivalent of his weight in about 15 days. In only 6 months, he takes in about a ton of oxygen, food, and water. On extended missions, it will be prohibitive to carry along all these supplies, and it will be necessary to use some of man's output for developing an input.

Current Innovations with Nutrients

Some unique ideas and innovations with the use of nutrients are being investigated for space flight. Clothing could be made of fibers spun from soy bean, casein, and zien. The United States Department of Agriculture has already developed fibers from egg whites and chicken feathers.

There is a possibility of using edible structures for the design of spacecraft fuel tanks, rocket motors, and lunar rocket launch facilities. Other ideas include the use of transparent sugar castings as a substitute for optical

5935

glass; glue and adhesives from fish, animal protein or starch; paper from soybeans, egg albumin or starch; and ink from vegetables.

The astronaut of the future who undertakes a space journey lasting from two to four years may receive a complete meal by chewing a concentrate the size of a licorice stick. The meal stick which is being developed will contain all the necessary vitamins, minerals, and calories of a full meal.

Investigation has gone into the synthetic development of high energy metabolites which are compounds having a greater density of calories for a given weight than the usual source of calories. These have been studied to lessen the weight and volume of food. Two compounds that have a caloric content higher than carbohydrate are being tested for consumption by man. These compounds are 2.4 di-methyl hepatanoic acid (2,4-DMHA for short) and 2-3 butanediol and do not exist in nature. They were designed entirely from consideration of biochemical and physiological energy requirements. It has not been advocated that the next astronauts carry a liquid diet of 2,4-DMHA and 1,3-butanediol, even though all kinds of tempting flavors could be added. A great deal more study is needed before it can be fed to humans. This is the first time a nutritional source has been designed that is potentially more efficient than nature. Always before the attempt has been to imitate nature. Because future space travelers will probably live on nutrients recycled from their own body wastes, this type of food may serve as "lifeboat rations." When the space traveler leaves his ship, these nutrients may be just what he needs.

The chemical synthesis of proteinoids from amino acids to go along with the synthetic vitamins is another possible food source. This chemical synthesis must be inexpensive and simple to operate for long duration space flights. These proteinoids have an acceptable taste similar to grilled fish in either the raw or roasted state.

Water that can't leak has been investigated. It's stored like jelly. It turns liquid only when squeezed, and becomes like jelly again when the pressure is relaxed. A substance somewhat like the gelatins used in ice cream which is edible could be put in an astronaut's drinking water or his soup. Since in space there is no gravity, water tends to ball up—form in droplets and this makes it hard for an astronaut to transfer it from one container into another containing dried, powdered food. There is a tendency for the droplets to escape and drift around in the cabin. Subsequently, this new gelled water does not break up into droplets. If some should escape, it becomes a gelatinous mass and simple to recover. It's not likely to float around and short cut the circuitry. When a glass of this water is turned upside down the liquid remains in the open glass. It can be spooned out, or transferred to a plastic squeeze bottle and can even be served cold.

There has been investigation into the development of a building material made from edible contents. This material contains hominy grits, powdered milk, cornstarch, flour, and powdered banana flakes. It is harder than fiberboard and contains 300 to 400 calories per 100 grams. For emergency food, it can be ground or soaked for 24 hours to make a cereal having a banana flavor. When molded in sheets and coated with a removable film laminate this

5936

edible material can be utilized for structures in space stations such as instrument panels, bunks, clipboards, walls, packaging and compartment dividers.

Many of these new nutrient ideas need much research before they can actually be utilized for space flight.

SUGGESTED ACTIVITIES

1. The student might collect pictures of astronauts' spacesuits and discuss the reason for the types of construction and the fabrics used, as relates to space flight.
2. The students could be divided into groups. Each group plans a meal and presents to the class, through demonstration, what would happen to each type of food if eaten under the conditions which exist in space.
3. The student could develop a written list of physical changes which might take place in the human body due to living in a spacecraft. Class discussion could evolve from these lists.
4. The students could plan two nutritional daily menus. One menu planned for a very active man and requiring a high caloric level. The second menu planned for a little-active astronaut and requiring a low caloric level. A comparison of the two menus could stimulate a discussion on caloric requirements.
5. Utilizing the daily menu planned for the astronaut which contains a low caloric level, the students might evaluate the menu to determine if they had provided adequate proportions of carbohydrates, protein, and fat.
6. From a list of astronaut foods, the students could plan three meals. One meal for a Mercury flight, one for a Gemini flight, and one for an Apollo flight. The three meals might then be evaluated for adequate proportions for the necessary nutrients.
7. Menus for Gemini and Apollo flights could be shown to the students. The students might evaluate the menus to determine whether each food would or would not be acceptable for space flight.
8. A discussion might be stimulated on the reasons for establishing strict weight, volume, packaging, and nutritional requirements for space food.
9. To stimulate discussion of the eating of space foods on a spacecraft, the teacher might puree some food in a blender and seal the pureed food in small plastic bags. The students might clip the corner of the plastic bag and squeeze the food into the mouth as the astronauts would do on flight.
10. A discussion might be developed on how the production of space food has influenced the production of certain consumer foods.
11. The teacher might have the students develop a list containing possible means of obtaining foods for the future, in the event the world food supply would run short. A discussion on foods of the future might evolve from these lists.

THE SOCIAL STUDIES AND AEROSPACE

THE SOCIAL IMPACT OF AVIATION UPON SOCIETY

I. Aims and Objectives

This unit is designed to help students:

1. Understand the national and international problems created by aviation.
2. Become aware of the part played by research in aerospace development.
3. Appreciate the services and responsibilities of all phases of domestic, international, and military flying.
4. Realize the growing interdependence of all people through aerospace development and related fields.
5. Appreciate the changes brought about in geographic relationships by the elimination of national boundaries and the changing concepts of time and space.
6. To comprehend more fully the magnitude of occupational opportunities offered by the aviation industry.

II. Outline of Unit Content

This unit is designed to help the student:

1. Understand the national and international problems created by aviation through the study of:
   a. Customs and conditions
   b. Language barriers
   c. Climatic conditions
   d. Geographical relationships
2. Understand the social impact upon the community where research centers are located.
3. Appreciate the services of all phases of air transportation by studying:
   a. Military uses of the airplane
   b. Public uses of the airplane
4. Study the mobility of our society and the psychological and sociological effects of it due to the changing concepts of space and time.
5. Understand the growing interdependence of all peoples through aerospace development and related fields.
   a. Personnel
   b. Education and training
   c. Accounting and finance
   d. Supply management
   e. Data management and processing
   f. Weather
   g. Behavioral science
   h. Maintenance and engineering
   i. Aircraft control
   j. Aerospace medicine and foods

5939

6. Study the magnitude of occupational opportunities offered by the aviation industry.

III. Suggested Student Activities

1. Make a bulletin board showing job opportunities in aviation.
2. Field trips to a local airport to see what various occupations are employed there.
3. Write to foreign embassies and obtain weather information and terrestrial conditions.
4. Make a map showing locations of various materials used in the construction of aircraft and spacecraft.
5. Make a map showing locations of research centers.
6. Engage the pupils in a Pen Pal Club with students from foreign countries.
7. Keep a notebook on the social, psychological, and physical changes and influences effected upon our society due to the "Space Age."

SOCIAL STUDIES AEROSPACE CURRICULUM DEVELOPMENT

The goal of aerospace education is not to make every student a professional pilot. The primary objective is to help all students understand the economic, social, cultural, and technological implications involved in aerospace—its operation, its problems, and most of all its possibilities. Because aerospace is such a dynamic and growing field, new problems and new areas are constantly arising, making it necessary to make changes. Because it is not static, what may be an adequate answer to any given problem today may not be an adequate answer tomorrow. One of the most important aspects of a student's education, therefore, should be to learn that while the techniques of problem solving may remain the same, no solution can be considered final. This conclusion has been dramatically demonstrated in the Mercury to Apollo missions in reaching the moon.

A study of the impact of aerospace is beneficial whether or not the student continues with any phase of aerospace or ever gets a pilot's license. All students who take a course in chemistry will not become chemists just as all students learning about aerospace will not become astronauts.

Aerospace education has unlimited possibilities and responsibilities to be a part of the fabulous future of the field of flight.

Government Involvement In Aviation

I. Aims and Objectives

The specific aim or objective of this unit is to help the student realize that our air space is our greatest national/natural resource, and as such necessitates government involvement and supervision.

II. Outline of Unit Content

This unit is designed to help the student:

1. Understand why our government is involved in aviation and aerospace.
   a. Military development and security
   b. Space exploration

c. Airport development
d. Airway systems development

2. Understand how our government is involved in aviation and aerospace.
   a. Laws concerning Air and Space
   b. International regulations
   c. Federal regulation of aviation
   d. Economic regulations and aviation
   e. State regulation of aviation
   f. Local regulation of aviation

III. Suggested Pupil Activities

1. Make a pie chart showing % of Military aircraft, General Aviation aircraft, and Commercial aircraft.
2. Prepare a bulletin board illustrating the advances in Military aircraft.
3. Spacemobile visit illustrating aspects of the space program.
4. Invite guest speakers to speak on such subjects as:
   a. Airport management
   b. Air control
   c. Registration of aircraft and pilots
5. Field trips to FAA Academy in Oklahoma City (if location will permit).
6. Trace the development of Federal regulation from the Federal Air Mail Act of 1925 to the present.
7. Study how the FAA investigates aircraft accidents.

AEROSPACE TERMS

Aerodynamics
The science that treats of the motion of air and other gaseous fluids, and of the forces acting on bodies when the bodies move through such fluids, or when such fluids move against or around the bodies.

Air density
The ratio of the mass of air to its volume, expressed as its weight per unit of volume, e.g., 1 kilogram per cubic meter.

Airfoil
A surface which furnishes lift, thrust or control to the vehicle.

Airspeed
The speed of an aircraft in relation to the air through which it is passing.

Airway
An air route along which aids to air navigation, such as beacon lights, radio ranges and direction finding facilities, and landing fields are maintained.

Altimeter
An instrument for indicating the relative altitude of an airplane by measuring atmospheric pressure.

Animometer
A device for measuring the velocity of the wind, in common use at airports.

Apogee
The point in an elliptical orbit around earth which is farthest from earth.

Apollo
United States program with the objective of earth-orbiting a space laboratory, launching astronauts to the vicinity of the moon, and landing a man on the moon, and returning him to earth.

Astro
A prefix meaning "star" or "stars" and, by extension, sometimes used as the equivalent of "celestial," as in astronautics.

Azimuth
The initial angle or direction between true North and a great circle course.

Bernoulli's Principle
As the speed of a confined fluid increases, the fluid pressure decreases.

Bioastronautics
Astronautics considered for its effect upon animal or plant life.

Center of Gravity
The point through which the resultant forces of gravity acts no matter how the body is oriented.

Centrifuge
A large motor-driven apparatus with a long rotating arm at the end of which human and animal subjects or equipment can be revolved at various speeds to simulate very closely the prolonged accelerations encountered in high-performance aircraft, rockets, or manned missiles.

GENERAL SCIENCE AND EARTH SCIENCE IN AEROSPACE

Unit: Aviation

Topics: History of Manned Flight
sample reference—FAA films
History of Aircraft Development
sample reference—Smithsonian Institute booklets
Aircraft Construction
sample reference—Piper Aircraft booklets
Forces Acting on Aircraft in Flight
sample reference—Jeppesen and Company
Function of Aircraft Controls
sample reference—Sanderson Company
Flight Maneuvers
sample reference—FAA films
Atmospheric Characteristics
sample reference—FAA, Weather Bureau
Weather Map Interpretation
sample reference—FAA, Weather Bureau
Radio Communications
sample reference—CAP, FAA

Air Traffic Rules
sample reference—FAA
Aerial Navigation
sample references—FAA, CAP, Sanderson Company

Suggested Activities:

1. Have students bring a collection of aviation magazines.
2. Have students bring newspaper clippings concerning aviation to place on the bulletin board for the aviation unit study.
3. Invite a local airport operator to speak to the class about aviation of the area.
4. Visit the local airport, with assistance of the local airport operator.
5. Visit a nearby FAA Flight Service Station.
6. Have students bring model airplanes for a hanging display during the unit of study.
7. Invite a representative of a model airplane flying club to speak and perhaps give a flying demonstration for the class.
8. Have an in-class contest of paper airplane, kites, glider, rubberband powered planes and gasoline powered planes.

GENERAL SCIENCE AND EARTH SCIENCE

Unit: Space Flight

Topics: History of Rocketry
sample reference—NASA films
Rockets and Newton's Laws
sample reference: Holt Company,—Library of Science
What is a Satellite
sample reference—NASA Films *Publications
Kinds of Satellites
sample reference—NASA Films
The Universe
sample reference—Film "Universe"—NASA
Manned Space Flights
sample reference—NASA Film
Taking Earth's Environment Into Space
sample reference—NASA Films
Space Flights to Other Planets
sample reference—NASA Films

Suggested Activities:

1. As a class project have the students build a mobile of the solar system.
2. As a class project have the students build paper models of spacecrafts.
3. Have the class simulate 1/6 gravity of the moon by suspending 5/6 of the weight by a rope to an overhead support.
4. Have the class build model rockets.
5. Have a model rocket contest by judging both the appearance and altitude of the rocket when it is fired.
6. Have the students build a mock-up space suit.

5943

7. Have a contest of the student's drawings and models of a proposed vehicle to travel on the moon.
8. Have the class build a model of a space station large enough to house 50 people and show where all the various types of equipment would be located.

AEROSPACE EDUCATION IN THE LIFE SCIENCES

Suggested areas of approach:

I. Environmental Biology

A. Biosphere—general discussion of the film of life
B. Exosphere—general discussion of the film of life
C. Life support systems to be considered in both biosphere and exosphere.
   1. Oxygen content control
   2. Pressure—both normal air pressure and artificial pressure
   3. Thermal control
   4. Water
   5. Food
   6. Waste control
   7. Hygiene
   8. Radiation effects
   9. Protection—radiation, meteorites, etc.
   10. Contamination
D. Implementing support systems in exosphere

II. Physiological Aspects of Aerospace

A. Physical effects: such as
   1. Circulation
   2. Respiration
   3. Pressure
   4. Weightlessness and muscle-tone relationships
   5. Dehydration
   6. Fatigue
   7. Various physical conditions such as hypoxia, hyperventilation, flicker vertigo, coreolis effect, etc.
   8. Visual orientation
   9. Cosmic radiation
   10. Possible meteoroid bombardment
B. Psychological Effects
   1. Requirements and training
   2. Stress
   3. Phobias
   4. Long periods of isolation
   5. Induced hiberation studies
C. Aeromedicine
   1. Experimentation—past and present
   2. Medical technological advances
      a. Cardiovascular monitoring devices

b. Electrostatic cameras for monitoring patients
c. Heart valve improvement
d. Transducer transmitter that relays intestinal data
e. Laser surgery
f. Aids to blind and deaf
g. Walking wheel chair
h. Other bionic devices

D. Health Education
1. Safety
2. Fitness
3. Personal hygiene

E. Effects of biological clocks (interruption of normal cycles)
1. Man
2. Animals
3. Plants

III. Genetic Effects — Mutations
A. Radiation
B. Weightlessness

Suggested Laboratory Exercise:

Procedure:

Select two containers, one of which will easily fit into the other. Affix pointer to the top of the smaller container. Use glue to fasten the stick. Drill a hole in the center of the bottom of the larger container. The diameter of the hole should allow the one-hole stopper to just enter. Adjust the height of the tube to the top of the container.

To Tube A attach a length of rubber tubing and affix the other end of this tube to the center of large container. Tube B should be attached to a piece of tubing which will be pinched shut after potassium hydroxide is added. The jar can be weighted with sand so that it sinks in a pan of water. Ice can be added to the water to produce varying ambient temperatures within the jar.

As the test animal consumes oxygen, the small container will sink in the water of the large container. The change in levels can be observed on the scale. The markings on the scale can be calibrated by introducing known amounts of air into container through the attached hose. Make several calibrations.

Once the scale is calibrated, you are ready to begin experimentation. Place a test animal in the jar. Stopper and attach the rubber hose of Tube A to the center tube of large container. Add saturated potassium hydroxide to fill bend in Tube B. Stuff cotton into the bent end. Close the other end by pinching the rubber tube with a pinch clamp. The potassium hydroxide in the cotton will remove the carbon dioxide exhaled by the animal. Why is this necessary? Record the original level of air in the small container and allow the test animal to remain sealed in the jar. Add ice to the water surrounding the jar and maintain a constant temperature while oxygen consumption is being recorded.

Determine the volume of oxygen consumed per minute for several ambient

temperatures. This can be calculated from the total oxygen consumed divided by the total time of the experiment.

Example: 30 cc of oxygen in 10 minutes = 3 cc of oxygen consumed per minute.

Determine the minute oxygen consumption rate for 20°, 15°, 10°, 5°, 0° Centrigrade using room temperature as a control. Graph the results.

Discussion:

1. What conclusions can you make about the effect of ambient air temperature on metabolic rate?
2. Which ambient air temperature provided the minimum metabolic rate?
3. What additional factors would have to be considered before this temperature could be used within space suits?

Additional Investigation:

This same apparatus may be used to investigate several space problems. Here are a few problems that are currently being considered by space scientists:

1. To what extent does hypothermia induce drowsiness or sleep?
2. How might the reduced activity associated with hypothermia affect the astronaut's ability to rapidly recover maximum performance efficiency?
3. Could hypothermia provide relief from the psychological and physiological problems associated with long-term confinement and boredom?
4. In what ways could forced astronaut hiberation be beneficial for long space flight?
5. Compare the metabolic effects of hypothermia in homeotherms with poikilotherms as a simulated study of estivation and hibernation.

(This laboratory exercise and many more may be found in the NASA publication *"Space Resources for Teachers—Biology."*)

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

INDUSTRIAL ARTS AND SPACE TECHNOLOGY

Industrial arts has been defined as the study of tools, materials, processes, products, occupations, and related problems of America's industrial society. As such the profession of industrial arts teaching necessarily concerns itself with those societal developments which have relevance to its area of study. America's space program is such a development. In the effort to increase mankind's knowledge of the heavens and the earth through the use of manned and unmanned spaceflight, America's space program has developed new tools, new materials, new processes, as well as new jobs, unheard of 10 years ago. It has provided great impetus to accelerating advancements and developments in science and technology, and the resulting changes in patterns for living.

Space is the new frontier of science and technology; and if industrial arts is to give students an insight into American industries, teachers must be more concerned with space age technology. The image of industrial arts will be greatly improved in the eyes of the students, parents, administrators, and the lay public when teachers introduce these changes to shop and classroom teaching.

SPACE AGE APPLICATIONS OF INDUSTRIAL ARTS TECHNOLOGY

Drafting:

Ellipses to show the orbit of a space vehicle, the sun and the planets.
Booster engines and stages.

Assembly: Draw the following:

Saturn V Rocket
Pipe cutting tool
Portable power tool
Chart case

Other areas are:

Electronic drawing
Sheet metal drawing
Pictorial drawing
Architectural drawing
Structural drawing
Plumbing drawing
Charts and drafts

NASA Tech Briefs are available which give detailed information in each of the above areas.

RELATIONSHIP TO INDUSTRIAL ARTS

By this time you have become aware of the magnitude of the aerospace industry; an industry encompassing many people working in many kinds of jobs. This space age industry can be said to be made up of a number of other industrial organizations, as shown in Fig. A. Space vehicles require products made of ceramics, plastic, and metal as well as the power and electronic components. It is evident that industrial arts can make a significant contribu-

tion to understanding the aerospace industry because it, too, is concerned with the same areas, as are shown in Fig. A. Industrial arts students work with the principles and the skills necessary to produce, propel, and control spacecraft. Fig. B shows graphically the kinds of systems present in these crafts and gives further evidence of the many opportunities for industrial arts teachers to help acquaint their students with the products and processes of the space age.

Fig. A

Fig. B

TYPICAL AEROSPACE OCCUPATIONS

aeronautical engineer
aeronautical draftsman
design draftsman
plumbing draftsman
electrical draftsman
mechanical engineer
aircraft designer
machinists
tool and die makers
welders
riveters
heat treaters
jig builders
press and shear operators
model maker
pattern maker
lathe operators
instrument maker
telephone engineer
television repairman
radio electrician
electronic engineer
truck mechanic
diesel mechanic
rocket engine mechanic
photographer
plastics fabricator
ceramics engineer
mock-up builder

A complete coverage of this subject is in the NASA publication "Space Resources for the *High School Industrial Arts.*" "Industrial Arts Resource Units."

PRIVATE PILOT GROUND SCHOOL COURSE

I. Introduction

We feel that the high schools in the state of Oklahoma should make every effort to incorporate aviation and aerospace information into every subject course where it could be inserted by reason of its current interest, its motivating assistance and its logical application in the sequence of study.

In schools which can introduce a separate course in the subject aviation or aerospace, it is recommended that the following be offered in the general education curriculum as an elective, one year (two semester) course.

This course is general and introductory or exploratory, not terminal in nature. No prerequisites are set, but the course is designed for use in grades 10, 11, and 12.

It is further suggested that teacher qualification include some evidence of a *strong* interest in aviation.

II. Objectives

1. To prepare all students so that they may participate in a society strongly influenced by the growth of aviation and space exploration.
2. To introduce the student, through highly motivational subjects of aviation and space, some disciplines of various academic fields. This would include an adequate reading and speaking vocabulary pertinent to aerospace.
3. To furnish all students opportunities for career exploration in aerospace.
4. To provide a flight experience for all students desiring it.
5. To provide some students aviation ground school and/or vocational and technical training in aviation skills.
6. To establish a collection of aerospace materials available to both school and community.

The objectives of this course would be reached by different options in course content. It is recommended that the decision of a specific combination of these options be left to the individual school, dependent upon their facilities.

AVIATION EDUCATION

Private

LESSON	*Orientation*
REFERENCES	Sanderson Teacher Education Manual, Flight Instructor's Handbook, Federal Aviation Agency, 1964
OBJECTIVES	Indoctrinate teachers to course methods, teaching techniques, the need for aviation instruction in schools and administrative considerations.
ELEMENTS	Aviation Statistics, Objectives, Organization, Administration, Methodology, Evaluation
SCHEDULE	Lecture :15 minutes Show Sanderson filmstrip, "Path of Least Resistance" :30 minutes Questions :05 minutes
EQUIPMENT	Private Pilot Manual (1) to ea. student DuKane Projector and filmstrip Blackboard TEACHER EDUCATION MANUAL (1) to each student
INSTRUCTOR'S ACTIONS	Orient teachers to Teacher Training Course Show filmstrip Answer questions
STUDENT'S ACTIONS	Register Sign class roster Introductions Ask questions regarding course
EVALUATION	Not required for orientation session

AVIATION EDUCATION

Private

LESSON — *Pre-Flight Facts (Section A)*

REFERENCES — *Private Pilot Manual*, Pre-Flight Facts, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.
Aviation Psychology Manual for Flight Instructors, H. J. Holmes and Thomas Hogan.

OBJECTIVES — Acquaint teachers (students) with aircraft components and the four forces.

ELEMENTS — *Aircraft Components* / *The Four Forces*

Wing	Lift
Power Plant	Gravity
Empennage	Thrust
Landing Gear	Drag
Fuselage	

SCHEDULE

Introduction of filmstrip	:10
Pre-Flight Facts, Section A	
Show filmstrip	:40
Question and answer session	:20

EQUIPMENT — DuKane Projector
Sanderson Filmstrip—Pre-Flight Facts Section A
Blackboard for post filmstrip instruction
Model airplane with moveable controls
Suggested Illustrations for overhead projector:

1. Aircraft Components
2. Wing Structure
3. Power Source
4. Four Forces
5. Propeller
6. Airfoil
7. Lift

INSTRUCTOR'S ACTIONS — Serve as a discussion leader following the showing of the filmstrip.

Typical questions:

What is the main function of the wing?

What is the role of the wing in producing lift?

Illustrate the four forces acting on an aircraft in flight. (Use blackboard)

What are two ways to recover from a stall condition? (Use model plane to illustrate)

What are the four strokes of the engine power cycle?

What is the purpose of the empennage?

Demonstrate or show how the propeller develops "thrust."

(In addition to the above questions, it is suggested that the teachers use the questions outlined in the Sanderson Programmed Learning System)

STUDENT'S ACTIONS

Discuss objectives and resolve above questions.

Review the major concepts presented in the filmstrip.

Demonstrate as many of the concepts as possible using a blackboard, model, or a visual aid.

EVALUATION

The lesson is complete when the student teachers can explain, illustrate, describe, define, discuss or formulate the ideas presented and communicate their ideas to others.

AVIATION EDUCATION

LESSON — *Pre-Flight Facts (Section B)*

REFERENCES — *Private Pilot Manual,* Pre-Flight Facts, Sanderson Films, Inc.—Sec. B *Flight Instructor's Handbook,* Federal Aviation Agency, 1964.

OBJECTIVES — Develop a basic understanding of the three axes: yaw, pitch and roll, along with the aircraft control system, the trim system, vacuum system, and electrical system.

ELEMENTS

The Three Axes
- Yaw Axis
- Pitch Axis
- Roll Axis

Aircraft Controls
- Ailerons
- Rudders
- Elevators
- Stabilators
- Wing Flaps

Trim Systems
- Trim Tab
- Adjustable Stabilizer
- Moveable Tail

Vacuum System

Electrical System

SCHEDULE

Introduction of filmstrip Pre-Flight Facts, Section B	:10
Show filmstrip	:40
Question and answer session	:20

EQUIPMENT

DuKane Projector
Sanderson Filmstrip—Section B
Blackboard
Model Airplane

Suggested illustrations for overhead projector:

1. Three Axes
2. Tail Structure (VS)
3. Horizontal Stabilizer
4. Trim Tab—Stabilator
5. More Down Trim
6. More Up Trim
7. Roll Right Bank
8. Roll Left Bank
9. Vacuum System
10. Venturi
11. Electrical System

INSTRUCTOR'S ACTIONS — Serve as a discussion leader following the showing of the filmstrip.

5953

Lift and drag on an airfoil.

Typical questions:

What is the one point in the airplane's attitude, about which it can be balanced perfectly?

Explain the yaw axis and related control surface.

Describe the pitch axis and related control surface.

Illustrate the roll axis and related control surface.

What are the trim systems provided to minimize elevator or stabilator control pressures?

Review the functions of the trim tab, adjustable stabilizer and moveable tail.

Discuss the electrical system. (In addition to the above question, the instructor should use questions outlined in the Sanderson Programmed System)

It is important to learn the relationship of lift to drag in regards to flap settings:

What is the purpose of the wing flaps?

Explain what flap settings are used for take-off and landing.

STUDENT'S ACTIONS

Respond to the above questions correctly; however, if there is some misunderstanding, teacher should be able to resolve points of confusion.

Review material and/or slides which are difficult to understand.

Discuss and review the important points.

EVALUATION

In presenting this unit, the teacher should use the question and answer quiz as much as possible following the showing of the filmstrip. A quiz will check the effectiveness of the lesson, check retention, review the material, build enthusiasm and repeat the important points covered in the filmstrip.

AVIATION EDUCATION

Private

LESSON — *Pre-Flight Facts (Section C)*

REFERENCES — *Private Pilot Manual,* Pre-Flight Facts, Sanderson Films, Inc.—Sec. C. Flight Instructor's Handbook, Federal Aviation Agency, 1964.
Aviation Psychology Manual for Flight Instructors, H. J. Holmes and Thomas Hogan.

OBJECTIVES — Create an understanding of what the primary function of the fuel system is, how it operates and why there is a need for different types of fuel systems. Acquaint teachers (students) with different types of landing gears and primary function.

ELEMENTS

Fuel System
Gravity Type Fuel System
Fuel Pump Type Fuel System
Fuel Tanks
Fuel Selector Valve
Fuel Strainer
Carburetor
Carburetor Heat System

LANDING GEAR
Conventional Landing Gear
Tri-Cycle Landing Gear
Brake System

Pre-Flight Inspection

SCHEDULE

Introduction of filmstrip	:10
Pre-Flight Facts, Section C	
Show filmstrip	:40
Question and answer quiz	:20

EQUIPMENT

DuKane Projector
Sanderson Filmstrip—Section C

Suggested illustrations for overhead projector:

1. Gravity Fuel System
2. Fuel Pump Type Fuel System
3. Carburetor
4. Carburetor ice
5. Carburetor Heat System
6. Brake System

Pre-Flight inspection checklist
Blackboard

5955

INSTRUCTOR'S ACTIONS

Conduct a question and answer quiz using some of the questions that follow:

What is the primary function of the fuel system?

Name two types of fuel systems.

Where is the fuel strainer located in relation to the fuel system?

Why should not the carburetor heat be used during taxi?

Where is the fuel selector valve located?

Explain the operation of the carburetor.

Name the two basic types of landing gears and the main difference between them.

Discuss the importance of a pre-flight inspection.

STUDENT'S ACTIONS

The students should be able to discuss the above questions.

Write in the correct answers to all of the questions outlined in the Sanderson Programmed Learning System following the Pre-Flight Facts Section. Look up wrong answers in Pre-Flight Facts Manual.

EVALUATION

Oral quizzing of Section A, B, & C. Look up wrong answers in Pre-Flight Facts Manual.

Responses to Sanderson Programmed Learning System.

GRAVITY TYPE FUEL SYSTEM

AVIATION EDUCATION

Private

CUMULUS

LESSON — *Meteorology (Section A)*

REFERENCES — Private Pilot Manual, Meteorology, Section A, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.

OBJECTIVES — Acquaint the teachers (students) with air masses and other weather phenomena.

ELEMENTS — United States Weather Bureau Weather Map
Terminology and Weather
Weather Symbols
Clouds
Atmospheric Pressure
Thunderstorms
Air Masses

CIRRUS

SCHEDULE

Period 1

Introduction of filmstrip Meteorology, Section A	:20
Showing of filmstrip	:40

Period 2

Lecture following filmstrip	:20
Manual repeat of film for question and answer quiz	:40

Period 3

Trip to U.S. Weather Bureau & Airport

EQUIPMENT — DuKane Projector
Blackboard
Actual Weather Maps
The Koch Chart

Suggested Illustrations for overhead projector:

1. Weather Map
2. Speciman (Station Model)
3. Basic Weather Symbols
4. Barometric Pressure in Millibars
5. Thunderstorms
6. High Pressure Area
7. Low Pressure Area
8. Cold Air Profile
9. Warm Front Profile
10. Occluded Front Profile

INSTRUCTOR'S ACTIONS

Arrange for a class tour of the weather bureau and airport if possible. Invite a meteorologist to speak to the class.

Typical questions:

What is the primary function of the weather bureau?

How often during a 24-hour period is weather information plotted on weather maps?

Discuss and explain the various symbols used in the station model.

What are isobars?

Name the two fundamental types of clouds.

Discuss thunderstorms and their stages.

STRATUS

NIMBUS

STUDENT'S ACTIONS

Discuss objectives and resolve questions.

Explain correctly the concepts and ideas presented in this session.

Recognize various frontal conditions and cloud formations.

Compute take-off distance using the Koch Chart.

EVALUATION

Lesson is complete when student can correctly explain each of the key elements listed above.

CLEAR: SMOOTH AND GLASSY

RIME: ROUGH AND COURSE

FLYING INTO LOW PRESSURE
(Aircraft Low)

FLYING INTO HIGH PRESSURE
(Aircraft High)

LESSON — *Meteorology (Section B)*

REFERENCES — *Private Pilot Manual*, Meteorology, Sec. A & B, Sanderson Films, Inc. *Flight Instructor's Handbook*, Federal Aviation Agency, 1964.

OBJECTIVES — Acquaint the teachers (students) with fog, icing conditions, density altitude, turbulence, frontal icing and weather reports by radio.

ELEMENTS

Fog	Turbulence
Density Altitude	Frontal Icing
Icing Conditions	Weather Reports by radio

SCHEDULE

Period 1

Introduction to filmstrip Meteorology, Section B	:10
Showing of filmstrip	:40

Period 2

Lecture following filmstrip	:10
Manual repeat of film for question and answer quiz	:40

EQUIPMENT

DuKane Projector
Blackboard
Weather Maps (daily fascimile)
Recording of weather reports (local airport)

CLEAR: SMOOTH AND GLASSY

RIME: ROUGH AND COARSE

Suggested illustrations for overhead projector:

1. Density Altitude
2. Scheduled Broadcast Order
3. Sigmets
4. Thermal Effect on Landing
5. Sea Level Takeoff
6. Koch Chart
7. Turbulence in Cumulonimbus Clouds
8. Effect of Ice
9. Vortex Core

Use following from Sec. A., Meteorology:

10. Cold Air Profile
11. Warm Front Profile
12. Occluded Front Profile
13. Barometric Scale
14. Warm Front Icing

INSTRUCTOR'S ACTIONS

Typical questions:

What is meant by density altitude?

How does density altitude apply to the pilot?

Name two kinds of ice and where they will form.

Tell about heavy aircraft turbulence.

Discuss various radio weather reports.

Explain mountain wave.

STUDENT'S ACTIONS

Be able to answer oral questions asked by teachers.

EVALUATION

Paper and pencil test.
Oral examination.

FLYING INTO LOW PRESSURE
(Aircraft Low)

FLYING INTO HIGH PRESSURE
(Aircraft High)

AVIATION EDUCATION

Private

LESSON — *Meteorology (Section C)*

REFERENCES — *Private Pilot Manual,* Meteorology, Section B, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.

OBJECTIVES — Introduce students to the weather advisory service and special advisories available to pilots.

Acquaint students with sequence reports, winds aloft forecasts, and other types of forecasts.

ELEMENTS — Weather Advisory Service
Sequence Reports
Sky Coverage
Ceiling
Visibility
Present weather conditions
Barometric pressure
Temperature and dewpoint
Wind
Altimeter setting
Pilot reports
The Notam Status Code

Winds Aloft Forecast
Terminal Forecasts

SCHEDULE — *Period 1*

Pre-filmstrip instruction	:20
Sanderson filmstrip Meteorology, Section C	:40

Period 2

Interpretation of Practice Teletype Reports—pages 1-1 to 1-5. Use practice frames, end of Section C filmstrip)	:40
Question and answer session	:20

EQUIPMENT — DuKane Projector
Blackboard
Actual Sequence Reports from local airport-Radio (for listening to "airway" broadcast of weather reports)

Suggested illustrations for overhead projector:

1. Sequence Reports

AVIATION EDUCATION

Private

LESSON — *Flight Computer (Section A)*

REFERENCES — *Private Pilot Manual*, Flight Computer, Section A, Sanderson Films, Inc.

Flight Instructor's Handbook, Federal Aviation Agency, 1964.

OBJECTIVES — Use of flight computer in pre-trip planning and to compute in-flight aircraft problems.

Develop greater confidence in flying through a good understanding of the computer.

ELEMENTS — *Flight Computer*
Calculator side
Changing values
Speed index
Multiplication or division index
Time and distance problem
Fuel consumption

SCHEDULE — *Period 1*

Introduction to computer	:10
Showing of filmstrip, Flight Computer, Section A	:40

Period 2

Lecture on computer use	:15
Work Practice Time and Distance Problems, page A-5	

Period 3

Work Practice Fuel Consumption Problems, page A-8, A-9, A-10	:30
Work Review Problems, Page A-10	:15

EQUIPMENT — DuKane Projector
Sanderson Flight Computers (one for each student)
Blackboard

Suggested illustrations for overhead projector:

1. Computer side of Sanderson Flight Computer (Moveable Scales)
2. Problem Logs (Draw on Clear Overhead Transparency)

5963

INSTRUCTOR'S ACTIONS

Lecture on the use of Flight Computer

Provide opportunity for students to solve problems presented in Sanderson Films, Inc., booklet entitled, "Flight Computer."

Assist those students who have difficulty in problem solving.

Review key points brought out in filmstrip.

STUDENT'S ACTIONS

Solve all flight computer problems in manual, Section A, Pages A-5 to A-10.

Develop correct understanding of the basic operation of the flight computer.

Explain what the "A", "B", "C" scales of computer are used for.

EVALUATION

Demonstrate ability to solve all computations presented in Section A with the use of a Sanderson Flight Computer.

Demonstrate the ability to explain the use of a flight computer to others.

PRACTICE PROBLEMS — TRUE HEADING AND GROUND SPEED

1. True course—310°; T. A. S.—120 m.p.h. wind velocity—16 m.p.h.; wind direction—180°; what is the true heading and ground speed?_____
2. True course—178°; T. A. S.—135 m.p.h.; wind velocity—23 m.p.h.; wind direction—45°; what is the true heading and ground speed?_____
3. True course—65°; T. A. S.—155 m.p.h.; wind velocity—20 knots; wind direction—Northwest; what is the true heading and ground speed?_____
4. True course—West; T. A. S.—130 knots; wind velocity—18 knots; wind direction—344°; what is the true heading and ground speed?_____
5. True course—95°; I. A. S.—111 m.p.h.; temperature—+25° C.; altitude—7,500 feet; wind velocity—10 knots; wind direction—360°; what is the true heading and ground speed?_____

COMPUTER SIDE OF SANDERSON FLIGHT COMPUTER

1. "A" SCALE—(Miles, miles per hour, gallons, gallons per hour, true airspeed, and true altitude.)
2. "B" SCALE—(Time in minutes, calibrated altitude, and calibrated airspeed.)
3. "C" SCALE—(Time in hours and minutes)
4. DENSITY ALTITUDE WINDOW
5. PRESSURE ALTITUDE WINDOW
6. TEMPERATURE CONVERSION SCALE
7. SPEED INDEX
8. AIR TEMPERATURE WINDOW
9. NAUTICAL—STATUTE CONVERSION ARROWS
10. UNIT INDEX FOR MULTIPLICATION AND DIVISION

COMPUTER SIDE OF SANDERSON FLIGHT COMPUTER

AVIATION EDUCATION

Private

LESSON — *Flight Computer (Section B)*

REFERENCES — *Private Pilot Manual,* Flight Computer, Section B, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.

OBJECTIVES — Solving of true airspeed problems using the flight computer.

Changing nautical values to statute equivalents with the use of the computer.

Finding answers to multi-part problems.

ELEMENTS — *Flight Computer*

T.A.S.	Statute miles
Nautical values	Multi-part problems

SCHEDULE — *Period 1*

Introduction of filmstrip Flight Computer, Section B	:05
Showing of filmstrip	:40
Period 2	
Lecture on Computer use	:15
Problem solving	:50

EQUIPMENT — DuKane Projector
Blackboard
Sanderson Flight Computers (one for each student)

Suggested illustrations for overhead projector:

1. Computer Side of Sanderson Flight Computer (Moveable Scales)
2. Problem Logs (Draw on Clear Overhead Transparency)

INSTRUCTOR'S ACTIONS — Introduce students to other uses of flight computer.

Assist students with problem solving.

STUDENT'S ACTIONS — *Know* how to compute T.A.S., conversion of nautical miles to statute and statute to nautical miles.

Explain correct use of the computer

EVALUATION

Require students to answer correctly all practice multi-part problems on page B-5.

Instructor should help answer student questions during problem solving period.

PRACTICE MULTI-PART PROBLEMS

1. Wind—0 m.p.h.; ground speed—120 m.p.h.; distance—320 miles; fuel consumption—9 g.p.h.; how much fuel will be burned?_____

2. Altitude—7,500 feet; I.A.S.—150 m.p.h.; temperature—+15° C.; distance—256 miles; fuel consumption—11.5 g.p.h.; wind 0 m.p.h.; how much fuel will be burned?_____

3. Altitude—9,000 feet; I.A.S.—115 m.p.h.; temperature of—10° C.; distance—335 miles; fuel consumption—8.5 g.p.h.; wind —0 m.p.h.; how much fuel will be burned?_____

4. Ground speed—135 m.p.h.; wind —0 m.p.h.; temperature—+20° C.; altitude—9,000 feet; distance—425 miles; fuel consumption—12 g.p.h.; how much fuel will be burned?_____

5966

STUDENT'S ACTIONS

Find correct answers to practice problems listed in Flight Computer, Section C, Appendix 1, page 1-1 in manual.
Describe the correct use of the computer in solving the various problems.

PROBLEM LOG

tas	dist.	time	gph	fuel
?	455	?	10	?

EVALUATION

Administration of Flight Computer Programmed Learning Tests at the end of the lesson on computers.
Discuss answers to Programmed test questions and look up answers in manual.

WIND SIDE OF SANDERSON FLIGHT COMPUTER

1. INSTRUCTIONS FOR FINDING GROUND SPEED AND TRUE HEADING.
2. SLIDING GRID
3. TRUE INDEX
4. WIND CORRECTION ANGLE SCALE
5. GROMMET
6. AZIMUTH
7. INSTRUCTIONS FOR DETERMINING TRUE HEADING, MAGNETIC HEADING, AND COMPASS HEADING

5968 2

AVIATION EDUCATION

Private

LESSON — *Navigation (Section A)*

REFERENCES — *Private Pilot Manual*, Navigation, Section A, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.

OBJECTIVES — To familiarize students with navigation charts.
To know how to select charts, read chart symbols, air traffic control symbols and aeronautical and topographical symbols.

ELEMENTS — WAC Charts
Sectional Charts
Latitude and Longitude Chart Symbols
Radio Facilities

SCHEDULE — *Period 1*

Lecture on introduction to Navigation	:20
Showing of filmstrip, Navigation, Section A	:40
Period 2	
Discussion of filmstrip information	:50

EQUIPMENT — DuKane Projector
WAC Charts
Sectional Aeronautical Charts
Blackboards
Suggested illustrations for overhead projectors:
1. Sectional Chart
2. Longitude
3. Latitude
4. Aeronautical Symbols
5. Topographical Symbols
6. Cruising Altitudes
   Flight Levels

INSTRUCTOR'S ACTIONS — Present a general lecture on Section A of Navigation, using as many charts and other aids as possible.
Develop a list of questions using Sanderson Private Pilot Manual.
Have the students interpret the various chart symbols during the question and answer quiz.

STUDENT'S ACTIONS — Correct *interpretation* of all chart symbols.

5969

Understand the major differences between the WAC Charts and Sectional Charts.

EVALUATION Oral quizzing by instructor.

Lesson is complete when student can retain the information presented during the filmstrip presentation and follow-up discussion.

AVIATION EDUCATION

Private

LESSON — *Navigation (Section B)*

REFERENCES — *Private Pilot Manual,* Navigation, Section B, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.

OBJECTIVES — Students should know how to use all of the flight planning aids.

Knowledge of all of the steps necessary in pre-trip planning such as drawing a course, selecting check points, measuring the true course and other computations.

ELEMENTS — *Navigation Planning Aids*
Flight Computer
Navigation Plotter
Airman's Information Manual

SCHEDULE

Period 1	
Introduction	:10
Showing of filmstrip, Navigation, Section B	:40
Period 2	
Question and answer quiz	:50
Period 3	
Pre-trip planning session	:50

EQUIPMENT — DuKane Projector
Sectional Aeronautical Charts
Navigation plotter for each student
Flight Computers for all students.
Airman's Information Manual

Suggested illustrations for overhead projectors:

1. Pre-Flight
2. Notices to Airmen
3. Airport Directory
4. Airport/Facility Directory
5. Magnetic North Pole
6. East Variation
7. West Variation (Instructors can use clear transparencies for drawing additional items for this section).

INSTRUCTOR'S ACTIONS — Serve as discussion leader following the filmstrip showing.

Assist students in planning a trip using all of the flight planning aid.

5971

Build question and answer session around overhead transparencies.

PRACTICE WINDS ALOFT FORECAST

STUDENT'S ACTIONS

Resolve any questions during the session following the showing of the filmstrip.

Plan a trip using all of the flight planning aids. (Omit radio frequencies and airport data.)

EVALUATION

Student demonstrations of ability to plan a trip using flight computer, navigation plotter, Airman's Information Manual and other manuals.

AVIATION EDUCATION

Private

LESSON — *Navigation (Section C)*

REFERENCES — *Private Pilot Manual*, Navigation, Section C, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.

OBJECTIVES — Knowing how to obtain radio frequencies and other airport data from charts and manuals.
Provide students an actual flight experience with a well-qualified pilot who will show how to plan a flight plan, fly a short cross-country trip, communicate with ground control and tower, compile a flight log and close flight plan upon arrival.

ELEMENTS
- Radio Frequencies and Airport Data
- Flight Plan
- Flying the Trip
- Pre-Takeoff
- Enroute
- Arrival
- After Landing

SCHEDULE

Period 1	
Introducing remarks	:10
Showing of filmstrip Navigation, Section C	:40
Period 2	
Discussion and questions	:50
Periods 3 & 4	
Trip to airport and flight	1:30

EQUIPMENT
- Sectional Charts
- Flight Plan Forms
- Navigation Logs
- Flight Computers
- Navigation Plotters
- Airplanes
- Airman's Information Manual

Suggested illustrations for overhead projector:

1. Teachers can use computer transparency, flight plan forms, navigation logs and plotters, etc.

INSTRUCTOR'S ACTIONS — Conduct question and answer session. Develop questions.

5973

Administer Navigation Programmed Learning System test.

Plan a trip to airport, in addition, arrange for airplanes and pilots to fly a short cross-country trip to a nearby airport.

STUDENT'S ACTIONS

Demonstrate ability to find radio frequency and airport data in Airman's Information Manual and navigation charts.

Fill out flight plan and know how to file it.

Assist pilot with navigation and check points during the trip, also, filing of flight plan.

FINDING GROUND SPEED AND TRUE HEADING

EVALUATION

Determine the amount of the subject retained by the students by administering test on Navigation at the end of Section C.

Evaluate student's ability to use sectional charts, airport data, etc., during actual flight if possible.

AVIATION EDUCATION

Private

LESSON *Radio Navigation (Section A)*

Private Pilot Manual, Radio Navigation, Section A, Sanderson Films, Inc.
Flight Instructor's Handbook, Federal Aviation Agency, 1964.

Bearings are magnetic at the station.
DME where shown indicates Distance Measuring Equipment.

Present advantages of the Omni Navigational Aid System.
Ways of determining position using the Omni radio equipment.
Methods of intercepting a radial.

Omni Navigation
Omni signal
Omni equipment
Flying inbound and outbound on a radial
Homing
Position Fixing
Intercepting a radial
Omni disadvantages

Period 1
Introductory remarks :10
Showing of filmstrip :40
Radio Navigation, Section A

Period 2
Questions and answer session :50
(Use pictures in filmstrip for this part.)

DuKane Projector
Blackboard
Sectional Aeronautical Charts
Table of VHF Reception Distances

Suggested illustrations for overhead projector:

1. Omni Station
2. Basic Indicators
3. Transparency of Omni Station with several radials and a miniature plane developed to be placed on overhead projector for the purpose of testing students. (Use illustrations in text, Pages A-7 and A-12.)

Serve as discussion leader following the showing of the filmstrip.

Demonstrate Omni equipment (Use overhead projector.) Present various

positions of the plane from Omni station and CDI indications.

Typical questions:

How many courses are available to a pilot using the Omni Navigational Aid System?

When the left-right needle is centered while on a course, will the wind drift the plane in either direction?

Are omni bearings true or magnetic bearings?

Where can a pilot obtain the information about a particular Omni Station (such information as the name of the station and its frequency?)

Name two types of Omni Stations.

What are the three basic indicators on the Omni equipment?

STUDENT'S ACTIONS

Explain the use of Omni as a radio navigation aid.

Determine the position of the airplane from the station.

Know how to locate himself when in doubt about his position on a flight.

Student *demonstration* of ability to intercept a radial.

Knowledge of VHF reception distances.

EVALUATION

While presenting this unit, the instructor should use the discussion method to determine the retention and knowledge of the subject matter on the part of the students. Students should be able to explain the basic concepts of the Omni equipment and how it operates.

5976

AVIATION EDUCATION

Private

LESSON

F. A. Regulations (Section A)

***Private Pilot Manual*, F. A. Regulations, Section A, Sanderson Films, Inc. *Flight Instructor's Handbook*, Federal Aviation Agency, 1964.**

To develop knowledge of Part 61 of the Federal Aviation Regulations, certification of pilots and flight instructors.

	61.3	Certificates and ratings required
	61.5	Application and issue
	61.7	Temporary certificate
	61.9	Duration of certificates
	61.11	Exchange of certificate
	61.13	Change of name
61.15	61.17	Aircraft ratings
	61.21	Prerequisites for flight test
61.23	61.25	Flight tests
	61.27	Retesting after failure
	61.39	Pilot logbooks
	61.43	Medical certificate
61.61	61.73	Student Pilots
61.81	61.101	Private Pilots

Period 1

Introductory remarks	:10
Show filmstrip	:40

F. A. Regulations, Section A

Period 2

Review session	:50

DuKane Projector
Blackboard
Arrange for resource person (FAA representative)

Introduce filmstrip

Conduct question and answer session.

Typical questions:

What is the minimum age at which a student pilot is authorized to pilot an airplane?

What are the requirements for solo flight?

What is the duration of a student pilot certificate?

At what age can a student pilot become eligible for a private pilot certificate?

5977

What class medical certificate is required for a private pilot?
In terms of minimum flight experience requirements for a private certificate, how many hours of dual instruction and solo flight time are required?
Where is acrobatic flight prohibited?
What are the right-of-way rules for an aircraft in distress?
Can a private pilot carry passengers for hire?

AVIATION EDUCATION

Private

LESSON	*F.A. Regulations (Section B)*
REFERENCES	*Private Pilot Manual,* F. A. Regulations, Section B, Sanderson Films, Inc. *Flight Instructor's Handbook,* Federal Aviation Agency, 1964.
OBJECTIVES	Understand definitions listed in Appendix 1 of F. A. Regulations, Section B, Sanderson Films Private Pilot Manual.
	Develop knowledge of all flight rules governing the operation of aircraft within the U. S. (Private pilot) This includes basic VFR minimums.
	Review of rules governing the maintenance of U.S. registered civil aircraft and rules for operating civil aircraft in a defense area, or into, within, or out of the U.S. through air ADIZ.
SCHEDULE	*Period 1*
	Introduction :05
	Showing of filmstrip :40 F. A. Regulations, Section B
	Period 2
	Question and answer session :50
	Period 3
	Examination :50
EQUIPMENT	DuKane Projector Blackboard
INSTRUCTOR'S ACTIONS	Arrange for a representative of the FAA to assist with discussion session. Administer an examination on Sections A & B of the Federal Aviation Regulations. (Instructor can use test questions from the Sanderson Programmed Learning System.)
STUDENT'S ACTIONS	*Read* aloud appropriate sections from F. A. Regulations, Section B. *Participate* in discussion. Demonstrate general knowledge of Federal Aviation Regulations.
EVALUATION	Ability to explain correctly F. A. Regulations to other students. Written examinations, Sections A & B.

5979

Training in Mail Room Occupations--A Means, Not An End.

Kentucky Research Coordinating Unit, Lexington.
Jefferson County Schools, Louisville, Ky.
MF AVAILABLE IN VT-ERIC SET.
PUB DATE - ND 150p.

DESCRIPTORS - *BUSINESS EDUCATION; *OFFICE OCCUPATIONS EDUCATION; *TEACHING GUIDES; *OFFICE MACHINES; *SECONDARY EDUCATION; RESOURCE MATERIALS; INSTRUCTIONAL MATERIALS; TEACHING TECHNIQUES; PROGRAM PLANNING; UNITS OF STUDY (SUBJECT FIELDS); RESEARCH COORDINATING UNITS; PILOT PROJECTS; ENTRY WORKERS
IDENTIFIERS - KENTUCKY

ABSTRACT - Based on the results of a high school pilot project, these instructional materials were developed to aid in training mail room employees. Recommended as a twelfth grade course, this guide includes teacher and student information on the: (1) Collator, Jogger, and Electric Stapler, (2) Mail Opener, (3) Folding Machine, (4) Inserting Machine, (5) Keyboard Embossing Machine, (6) Addresser-Printer, (7) Mailing Machine, and (8) Parcel Post Scale and Scales. Also included are nine instructional units covering such topics as the zip code, bulk rate mail, and automation. Additional resource materials for the teacher are appended. A description of the pilot project is included. (JS)

TRAINING IN MAIL ROOM OCCUPATIONS -
A Means, Not An End

BY

William Aiken, Director of
Vocational Education
Jefferson County Schools
Louisville, Kentucky

and

Clayton Omvig, Director
Research Coordinating Unit
Department of Vocational Education
College of Education
University of Kentucky
Lexington, Kentucky

What can the vocational department of a school do to meet the special needs of students who are in their senior year and have never been enrolled in, or exposed to, occupational training? Can these non-vocational students, less than a year away from graduation, be helped to receive entry level skill training that will open a door for them in the world of work? Jefferson County Schools, Louisville, Kentucky, in a cooperative project with the Kentucky Research Coordinating Unit for Vocational Education (KRCU), came up with a rather unique, one year training program in mailroom occupations which did much to answer the two aforementioned questions.

In the winter of 1968, the State Bureau of Vocational Education gave encouragement to the local schools of Kentucky to develop new vocational programs with a different approach, a new philosophy, and innovative methods to achieve the established goals of vocational education. Jefferson County was interested in participating and assistance was sought from the Research Coordinating Unit. This assistance took the form of consultation on program planning and supplemental funds needed to initiate the program.

Every comprehensive high school has a large number of seniors who have not been enrolled in any of the established vocational programs and who have no intention of going to college. Jefferson County Schools was no exception. Therefore, the over-riding goal which permeated the entire conceptual view in planning this project was what can be done in one year that will equip these students with: 1) a skill that would open a door in the job market, 2) a better image of themselves, 3) the ability to deal with the mechanics of job application, 4) a knowledge of the many opportunities that

actually exist for employment, and 5) an opportunity to achieve while in school.

The vehicle used to accomplish this goal was a simulated mail room facility not unlike those found in a large business. The greater Louisville area offered numerous opportunities for mailroom occupations, but no training in postal occupations was available to in-school youth. Therefore, this area of training was selected, Other areas of training might have been just as appropriate to the achievement of the program goals, for the main purpose of the project was not solely to train students for mail room occupations, but to implement the idea or philosophy that something could be done in one year for the students we have been missing in the regular vocational programs.

The general purposes of the mail room project were:

1. To teach operating skills on the machines in the laboratory, including the collator, jogger, mail opener, embossor, addresser-printer, folding machine, inserting machine, parcel post scales, other scales, and the mailing machine
2. To relate the machine skills learned to actual business situations
3. To develop within the students an awareness of job opportunities
4. To help students overcome the problems encountered in the transition from high school to work

The Students

The students with whom this project was concerned were those that vocational education had been missing, but the very ones which the Vocational Amendments of 1968 stressed should be served. They were not enrolled in

6057

vocational education; they were not achieving in their academic subjects, but they were not drop-outs. They were getting by, and that was all. Many were characterized by poor attitudes, poor academic performance and economic and social deprivation. They were twelth graders, almost ready to terminate their high school careers, but with no saleable skills, no intention of going on to college, and no orientation to other forms of post-secondary education. The intention was to develop a program, and later programs, that would equip these students with entry skills, and more important, to change attitudes and change the self-image that these students had developed.

A natural human tendency is to crave and enjoy success experiences. Many students in our nation's schools, such as the students described above have experienced little or no success in their academic courses. The image these students had of themselves was not good, and repeated D and F grades did little to change their self-concept.

Over the two year period during which the program has been operating, sixty students were selected and enrolled from the number which applied. These students were identified by the school's professional counseling staff as being disadvantaged socially, academically, or economically.

The Program

The pilot mail room training program was organized in 1968 as a part of the Division of Business and Office Education and was originally called Postal Occupations. During the summer of 1969, the Supervisor of Business and Office Education and the teacher who had taught the course

refined the curriculum which was developed during the first year and changed the name of the course to Office Services.

The mail room training program was housed in a simulated laboratory setting. Visits were made to large businesses and to the U.S. Postal Department in the Louisville area to ascertain the types of postal equipment which were applicable and arrangement of the equipment in the laboratory.

If properly organized and carried out, simulation can be a very effective technique in occupational training. But, a cooperative program which puts the student into a real job situation is generally preferred by vocational educators. The high school chosen as the pilot school for this new course, Eastern High School, Middletown, Kentucky, had no cooperative program. Therefore, a simulated program was developed. The plan was to combine the best aspects of both simulated and cooperative programs into the course activities. The project went beyond the "make believe" of simulation. The activities carried out in the training facility were not mythical. They were real - as real as any tasks performed in a cooperative program. The only difference was that they were done in the laboratory. Real mailing projects were brought into the school from the business world; this brought added meaning to the simulation. Instead of sending the students to the work, the work was brought to the students. The very heart of the program was in these work projects. The projects were volume mailings from large and small businesses, from universities, alumni associations, charity drives, churches, social and philantrophic organizations, and local schools. One mailing alone contained nearly 100,000 pieces of mail and over

one quarter million pieces of mail were handled during the first year of the program. These projects gave meaning to the skills the students were learning. They learned the value of accuracy and meeting time schedules. There was no room for error when a customer had to be satisfied or if the student's program stood to lose money if envelopes and letters were ruined or if the postage machine was incorrectly operated. These values, as well as the pride of achieving and experiencing success, were not simulation to these students.

The training followed a standard rotation system whereby each student received instruction as to the use, care, safety precautions, and operation of each machine in the laboratory. This instruction preceded the application of skills learned to the actual mailing projects.

The machines in the laboratory were not machines which were familiar to the students. Therefore, a certain amount of curiosity was immediately aroused by the presence of the machines, and the students looked forward to learning how to operate them.

Outlines on the operation of each machine were provided to the students and, because of the small class size (fifteen), the students could stand close to the machines and follow their instruction sheets while the instructor demonstrated machine operation. The students were responsible for knowing the information about each machine and kept notebooks with the various instruction sheets included.

Skill building on the machines closely followed the demonstration, with students being assigned in pairs. One member of the team operated the machine while the other, the assistant, helped the operator with machine set-up. The assistant then observed the operator in action. When the

operator had completed his job, the team changed places and the same process was repeated.

The teacher observed both students and gave credit for each job when completed. The teams then rotated to another machine and did an assigned job at that work station. This procedure was repeated until each student could efficiently operate all the machines in the laboratory and was consciously aware of mail flow activities.

In addition to the skill training component, the program contained an extensive amount of personal and group guidance. The students were taken on field trips to industry; they were provided with occupational information; and representatives from business, industry, and government came to talk to them and to observe them in their work. Attitudes and self-concept were two major problems these students faced, and the teacher had as a major goal the improvement of both.

Outcomes

Some of the project outcomes reported here are based entirely on subjective judgments made by the students, the teacher, and the project director. Other outcomes are concrete and measurable. It was felt that both would be worthy of reporting.

The students enrolled in this pilot program needed a different approach to education and they found it. They expressed excitement about such aspects of the program as:

1. the machines and learning to operate them
2. working on "real" projects from some of the largest businesses in their community

3. learning about opportunities they never dreamed existed, and more important, they began to see themselves as capable of "fitting in"
4. achieving good grades-a first experience for some
5. meeting important people from business, industry, and government who came to talk to them
6. being exposed to the business world through visits
7. having some personal attention and seeing someone concerned about them

Although not the sole purpose of the project, making the students employable at the entry level was a goal of the project. This goal was achieved. Of the sixty students who participated in the project over the two year period, all but five obtained employment in an occupation which was directly or closely related to the instruction. Types of employment included: mail room occupations, secretarial and clerical occupations in which mail handling was among the assigned duties, employment in the U. S. Postal Department, and parcel service occupations. Of the students who did not find gainful employment, marriage and military service accounted for three. Placement was excellent, considering the present unemployment rates for youth.

Attitudinal development and the improvement of the students' self-image were also among the project goals. These two concepts were difficult, if not impossible, to directly measure. But, indicators of success were observable. Considered as indicators were the students' grade point averages and attendance records, eleventh versus twelth grade. Favorable

teacher comments were also subjectively considered.

Although a statistical comparison of significance could not be made, the grade point averages achieved by these students appeared to increase substantially. A true comparison could not be made since the courses taken during the two years were different. As juniors, the average grade point earned by the postal occupations' students was 1.76. As seniors, while enrolled in the postal occupations' course, the average grade point rose to 2.14. Very likely, other factors also contributed to this increase, but the project staff was convinced that much of this increase was due to the student's involvement in the project.

Student attendance was another variable considered in the evaluation of the effectiveness of the course. Analysis of the students' records revealed a substantial drop in absenteeism on the part of the students included in the pilot course. As juniors, the total days of absenteeism for these students was 1078, or an average of 18.6 days per year, per student. As seniors, the total was 595, or 10 days per student. This represented nearly a 50% reduction in absenteeism. Personal comments made by the students may account for part of this decrease. The students indicated, "we like the course," "we like to do the work," "this class means something." They apparently wanted to attend school to take part in the work activities. This conclusion was further founded by analysis of when the students were absent as seniors. Half-day absence was more prevalent, and these half days were missed opposite the half day in which the course was offered.

All-in-all, the project was considered to be a success. After initial financial support from the Research Coordinating Unit, the course has now

been included as a regular part of the school curriculum. It has become self-sustaining, equipment-and postage-wise, through the collection of a small fee for each piece of mail handled. The equipment, after two years of extensive use, is still in perfect condition; the students take pride in the facility. What has been learned in the operation of this pilot project has been incorporated into the planning of other one year courses. This course will probably not be initiated in any other school in Jefferson County, for the intent was not to flood the market with postal employees, but to demonstrate that we can work effectively with seniors whom we previously missed.

Another result of the project was the development of a written curriculum and lesson plans for each unit that was taught in the course. The project was launched with no curriculum or lesson plans, just an idea. Hard work and dedication by a compassionate teacher resulted in ultimate success.

A limited supply of the lesson plans and curriculum materials developed in conjunction with this project are available from the Kentucky Research Coordinating Unit, 152 Taylor Education Building, University of Kentucky, Lexington, Kentucky 40506.

FOREWORD

The responsibility of any school system is to provide for the educational needs of all children. Many students enrolled in the twelfth grade of the Jefferson County Public Schools will be seeking employment immediately following graduation. The wide use of machines in performing present-day business services has opened a new field to these students. A course designed to familiarize them with the operation of business machines was added to the high school curriculum in 1968.

During the summer of 1969 the Supervisor of Business Education and Distributive Education and a teacher in this field developed Office Services. This publication is intended for use as a guide by teachers of the course dealing with business machines.

The cooperation of the State Department of Education and the Louisville Branch Office of Pitney-Bowes, Inc., has been invaluable in planning the course.

Sincere appreciation is expressed to those who participated in the development of this guide.

Richard VanHoose
Superintendent
Jefferson County Schools

INTRODUCTION

There are students enrolled in their twelfth year of study in public secondary schools who have given little thought to choosing a vocation, have developed few or no job skills, and have very little motivation to seek additional schooling or training after graduation.

Because of concern for these students, the Supervisor of Business Education in Jefferson County, Kentucky, conceived the idea of developing a program designed to help them and worked out the preliminary details with the Department of Vocational Education in Frankfort, Kentucky.

Eastern High School in Middletown, Kentucky, was chosen for the program which started in the fall of 1968. The class was called Postal Occupations during the first year. The second year the name was changed to Office Services.

A coordinating unit for research at the University of Kentucky provided eleven thousand dollars worth of equipment of a type that is often found in the office services department of a large company or the mailing facility of a business.

Pitney-Bowes is the manufacturer of all the equipment in the laboratory. The following machines are now being used.

Collator	Folding Machine
Jogger	Inserting Machine
Mail Opener	Parcel Post Scales
Embossing Machine	Scales
Addresser-Printer	Mailing Machine

0803 6078

The manufacturers have smaller and larger machines of each of the model in the laboratory; however, the middle model of each of the machines was selected as the best for learning skills. Films and field trips provide exposure to other models designed to perform the same basic function. This guide will refer to the specific machines used in the laboratory. In the future, it is possible that other machines may be added.

The class meets one hour each school day and one unit of credit is awarded upon completion of the school year. The size of the class is limited to a maximum of fifteen. The students must be approved by a school counselor or a teacher in the business department. Learning and enriching experiences that are of personal value to the student are coordinated with the operation of the machines and the building of skills which comes through the performance of actual jobs for local individuals and businesses.

Evaluation for the six-weeks grading periods is varied according to the jobs and activities carried on in the classroom during that period. This program is designed to help the students find themselves and to have the feeling that it is possible to succeed at something--their success being that they can perform jobs which require repetition and the use of their hands. Consequently, they are not penalized in any way for failure or for a poor background in academic subjects. This one fact, above all others, probably is responsible for the greatest motivation of the students.

Financially the class is self-sustaining. A service charge of one cent per piece of material processed is charged. The money received goes into a fund from which small miscellaneous supplies are purchased and transportation for field

trips provided. The student's Filing Practice Set and book[1] is paid for out of this fund, also. With this fund there will be no need in the future for an initial loan from the school office to put postage in the Mailing Machine.

The second year of this program has now been completed and those familiar with it judge it to be a success. As far as is known there is no other program similar to this one anywhere in the United States.

This guide provides the methods used and units developed for the program.

6081

IMPORTANCE OF JOBS IN THE LABORATORY

Suggested Procedure for Obtaining Jobs

After the students have learned to operate the machines successfully, real jobs from organizations and businesses are needed in order for the students to improve in speed and efficiency and to develop other desirable working traits.

Jobs done in the laboratory should be intermingled with other units presented during the year, according to the judgment of the teacher.

Initiative is important on the part of the teacher. Contacts need to be made inside and outside the school. First, a letter explaining the program and services available could be sent to the individuals who might use the services of the students. Follow-up should then be made with a personal appointment or telephone call. Any questions from the individual could be answered at this time.

It should be made easy for an individual to contact the teacher at school to schedule jobs that they will have at a later date or to inquire about jobs. Individuals should be given the school telephone number so that the teacher may be contacted either during her planning period (give the time) or they may be asked to call at their convenience, and leave their name and telephone number so the teacher may return their call during her planning period. This will be valuable in communication and planning between the teacher and individuals for whom the students do jobs.

6082

Sources of Jobs

There are sources of jobs in the school and the community. Teachers, counselors, secretaries, and other personnel at the school should be given information concerning jobs which can be performed in the laboratory. The following groups and organizations may provide such jobs.

Parent-Teacher Associations	Book company representatives
YMCA and YWCA	Local businessmen
Alumni Associations	Leaders of civic and charitable organizations

OBJECTIVES

Main Objective

To help students with no previous vocational curriculum experience become aware of job opportunities and to develop some skills to a job-entry level

General Objectives

To teach operating skills on the machines in the laboratory: Collator, Jogger, Mail Opener, Embosser, Addresser-Printer, Folding Machine, Inserting Machine, Parcel Post Scales, other scales, and Mailing Machine

To relate the machine skills learned to actual business situations

To provide enriching learning experiences that will encourage self-improvement

To develop an awareness of job opportunities

To help students with problems which they will encounter in the transition from high school to the first job

6084

ORIENTATION TO COURSE
(Two Class Periods)

I. Uniqueness of course

A. First in Kentucky

B. Name change from Postal Occupations to Office Services

C. Visitors to classes and laboratory

D. Difference from any course student has taken

E. Materials free to student because of service charge for work done by them in this class

II. Equipment

A. Funded by Research Coordinating Unit from University of Kentucky

B. Value--$11,000

C. Care

1. Dust

2. Keep covers on

3. Turn switches off after use

III. Student attitudes

A. Desire to operate machines efficiently

B. Desire to make self-improvements

C. Desire to learn about job opportunities

D. Willingness to work

IV. Content of course

A. Topics

1. Operation of machines

2. Volume mailings

3. Filing practice set

4. Enrichment units

6085
0808

B. Procedures

1. Classroom demonstration and practice

2. Guest speakers

3. Films

4. Filmstrips

5. Transparencies

V. Opportunities that could develop from course

A. Discovery of new interests and awareness of new jobs

B. Part-time jobs during school year

C. Jobs during holiday vacations from school

D. Jobs immediately after graduation

VI. Follow-through from course

A. Job applications and interviews

B. Civil Service examinations

C. Job placement

D. Easier transition from high school to job

A question and answer period should be provided with the students being given ample time to ask questions concerning the course, or other related questions.

The machines in the laboratory are not machines which are familiar to the students. Therefore, a certain amount of curiosity is immediately aroused by the presence of the machines. It should be briefly shown what each machine will do without going into any detail about the operation. The students will look forward to learning how to operate the machines.

Machines

Outlines for the instruction on each machine[1] follow the order in which the machines are taught to the students. The students stand near the machine for each demonstration. This is possible because of small classes. Duplicated sheets containing specific information relating to the machine in the laboratory are given to all students with words in all capitals to indicate parts of a machine which the student should be able to identify. Students are responsible for knowing all information on sheets given them and to assemble the sheets in a folder to be checked periodically by the teacher.

Skill building on the machines should follow this procedure. Students are assigned to teams of two. The student operating the machine is called the operator and the other member of the team is the assistant. The assistant helps the operator to get the machine set up for operation and then quietly observes the operator in action. When the operator has completed his job, he changes places with his assistant to help him and observe him.

The teacher observes both students and gives them credit for each job when completed. The teams rotate to another machine and do an assigned job on it until each student can operate all the machines in the laboratory efficiently.

---

COLLATOR-JOGGER

ELECTRIC STAPLER

89 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

COLLATOR, JOGGER, AND ELECTRIC STAPLER

Teacher Material

Description	Pitney-Bowes Model 60R16, 16 stations (or bins), electric semi-automatic, floor model
Use	To assemble booklets or brochures (Up to sixteen pages may be assembled at one time on this model.)
New Term	Aerate--to supply paper with air (This is necessary before putting paper into the Collator.)
Activity	Provide all students with a small stack of paper (approximately 50 sheets) and have them practice aerating (The same paper may be used many times.)

Machine Demonstration

I. Setting up the Collator and Jogger

A. Remove cover and place in a safe place

B. Lift FEED ARMS with FINGER-LIFT CONTROL

C. Load STATIONS--one TRAY at a time

1. Pull out TRAY from operating position
2. Make adjustment for size of paper
3. Check sheet SEPARATORS
4. Aerate paper and place in STATION
5. Return TRAY to operating position
6. Follow the previous five steps for each TRAY used

D. Check FEED ROLLERS in all STATIONS

1. Place rubber part of ROLLER facing down in STATIONS being used
2. Place metal part of ROLLER facing down in STATIONS not being used
3. Lower FEED ROLLERS by FINGER-LIFT CONTROL

E. Check STROKE ADJUSTMENT

F. Set COUNTER on zero

G. Place Jogger a convenient distance to the right

H. Turn MOTOR SWITCHES on to Jogger and Collator

II. Operating the Collator and Jogger

A. Start (A light touch of the FOOT SWITCH activates the FEED ARMS in each STATION which pushes out the top sheet of paper in each STATION being used.)

B. Inspect (Quickly train eyes to scan pages to make sure that no blank or misprinted pages are used.)

C. Grasp (With one motion gather all pages.)

D. Place assembled booklets in Jogger to vibrate the papers and make the pages of each booklet even (Consecutive booklets are placed in opposite directions, giving a criss-cross effect so that the booklets are easy to handle when stapling.)

III. Completing job responsibilities

A. Turn off MOTOR SWITCHES to Collator and Jogger

B. Remove all paper left in STATIONS of Collator

C. Return COUNTER to zero (Always inform teacher of number on COUNTER.)

D. Replace cover on Collator

E. Move booklets from Jogger to table and staple

IV. Stapling--Acco Model AVS Electric Stapler

A. Features

1. May staple up to 120 times per minute

2. Has stapling capacity of 20 sheets of bond paper and 25 sheets of onion skin paper

3. Uses any brand of standard staples

B. Operation

1. Learn correct method of refilling (Always unplug.)

2. Learn to adjust margin

Student Participation

1. Give each student an opportunity to sit down at the machine and collate several booklets for the "feel" of it with the remainder of the class observing (All Stations in the Collator will be filled from the machine demonstration.)

2. Give the students an opportunity to staple several times

6092

Supplementary Materials

1. Show pictures of other models of Collators and point out some of their features (Example--Rolomatic has 50 stations and collates, counts, stitches, and staggers completely automatically.)

2. Give students duplicated sheets containing specific information about the Collator in the laboratory (They are responsible for learning this information.)

Skill Building

The students should develop the following skills.

1. Be able to identify the parts of the Collator

2. Be able to refill the stapler and use it properly

3. Following the Rotation Plan and team assignment, collate the following

   a. Fifty booklets of 16 pages each
   b. Fifty booklets of 8 pages each
   c. Fifty booklets of 4 pages each

6093

COLLATOR, JOGGER AND ELECTRIC STAPLER

Name_____

Team_____

Student Material
(To be duplicated and given to students)

Description	Pitney-Bowes Model 60R16, 16 stations, semi-automatic, floor model
Use	To assemble booklets or brochures (Sixteen pages may be assembled at one time on this model.)
New Term	Aerate--to supply paper with air (This is necessary before putting paper into the Collator.)

Operating Procedures

I. Setting up the Collator and Jogger

A. Remove cover and place in safe place

B. Lift FEED ARMS with FINGER-LIFT CONTROL

C. Load STATIONS one TRAY at a time

1. Pull out TRAY from operating position

2. Make adjustment for size of paper

3. Check sheet SEPARATORS

4. Aerate paper and place in STATIONS

5. Return TRAY to operating position

6. Repeat the five steps for each TRAY used

D. Check FEED ROLLERS in all STATIONS

1. Place rubber part of roller face down in all STATIONS being used

2. Place metal part of roller face down in all STATIONS not being used

3. Lower FEED ROLLERS by FINGER-LIFT CONTROL

E. Check STROKE ADJUSTMENT

F. Set COUNTER on zero

G. Place Jogger a convenient distance to the right

H. Turn on MOTOR SWITCHES to Jogger and Collator

6094

II. Operating the Collator and Jogger

A. Start (A light touch of the FOOT SWITCH activates the FEED ARMS which push out the top sheet of paper each STATION being used.)

B. Inspect (Quickly train eyes to scan pages to make sure that no blank or misprinted pages are used.)

C. Grasp (With one motion gather all pages.)

D. Place assembled booklets in Jogger to vibrate the papers and get the pages of each booklet even (Consecutive booklets are placed in opposite directions, giving a criss-crossed effect so that the booklets are easy to handle when stapling.)

III. Completing job responsibilities

A. Turn off MOTOR SWITCHES to Collator and Jogger

B. Remove all paper left in STATIONS of Collator

C. Return COUNTER to zero (Always inform teacher of number on the COUNTER.)

D. Replace cover on machine

E. Move booklets from Jogger to table and staple

IV. Stapling--Acco Model AVS Electric Stapler

A. Features

1. May staple up to 120 times per minute

2. Has stapling capacity of 20 sheets of bond paper or 25 sheets of onion skin paper

3. Uses any brand of standard staples

B. Operation

1. Learn correct method of refilling (Always unplug.)

2. Learn to adjust margins

Skill Building

1. Know the parts of the Collator

2. Know how to refill and use properly

3. Collate (according to Rotation Plan)

a. Fifty booklets of 16 pages each
b. Fifty booklets of 8 pages
c. Fifty booklets of 4 pages

MAIL OPENER

MAIL OPENER

Teacher Material

Description	Pitney-Bowes Model LA; semi-automatic; largest model of three
Use	To open letter mail and stack it efficiently
New Term	Fanning envelopes--exposing them to air Jogging envelopes--giving them a slight shake on the table so that paper clips will not come in contact with the cutting knives
Activity	Provide each student with a small stack of envelopes to fan and jog

Machine Demonstration

I. Setting up the Mail Opener

A. Remove cover and place in a safe place

B. Set TRIM ADJUSTMENT according to the depth of cut desired

C. Adjust STACKER to catch envelopes and CHIP CATCHER to collect chips ejected

D. Fan and jog envelopes

E. Turn on MOTOR SWITCH to machine

II. Operating the Mail Opener

A. Place envelopes on LETTER FEED PLATE

B. Exert gentle downward pressure on right end of stack (Letters will feed from bottom of stack.)

III. Completing job responsibilities

A. Turn off MOTOR SWITCH

B. Remove CHIP CATCHER, place chips in the waste paper basket, and return to proper place

C. Replace cover on machine

D. Remove opened letters from STACKER

6097
8003

Student Participation

Give each student an opportunity to run his stack of envelopes through the Mail Opener several times to get the "feel" of it. To conserve envelopes, the same ones may be used over until the envelopes are about half their original size.

Supplementary Materials

Show pictures of the other two models of Mail Openers manufactured by Pitney-Bowes (Point out any differences in the picture and the model in the laboratory.)

Share with the students some case studies involving different types of companies and ways in which a Mail Opener is used in their business (Show picture of mail opener used in each case study. Use "10 case studies of Time and Money Savings made possible by Pitney-Bowes mail openers" (Series B) Free from Pitney-Bowes, Inc., Stamford, Connecticut.)

Give students duplicated sheet containing specific information about the Mail Opener (They are responsible for learning this information.)

Skill Building

The students should develop the following skills.

1. Be able to identify the parts

2. Be able to operate the mail opener efficiently (Have student spend a minimum of 15 consecutive minutes operating the mail opener. This is the easiest machine in the laboratory to operate so the student should concentrate on speed along with skill.)

MAIL OPENER

6099

FOLDING MACHINE

FOLDING MACHINE

Teacher Material

Description	Pitney-Bowes Model FH with AUTOMATIC FEED PLATE Range of speed approximately 6,000 8½" x 11" sheets per hour May be attached to Inserter Model 3300
Use	To fold sheets of paper various ways
New Terms	Shingle or shingling--to lay as to overlap (like shingles on the roof of a house) Leading--end of paper going into the Folding Machine first Trailing--end of paper going into the Folding Machine last
Activity	Provide each student with a small stack of paper (approximately 50 sheets) to aerate and then shingle it in preparation for the folding machine. The same paper may be used many times

Machine Demonstration

I. Setting up the Folding Machine

A. Remove cover and place in a safe place

B. Adjust FRONT and REAR PAPER GUIDES

1. Center paper

2. Position the FRONT PAPER GUIDE to correspond with the width of the paper, leaving about the thickness of a dime between the paper and GUIDE. Loosen screw to move GUIDE; tighten screw when the GUIDE is in correct position

3. Position REAR PAPER GUIDE up to the paper, leaving about the thickness of a dime between paper and GUIDE; using the same procedure as above

C. Set the SEPARATOR for thickness

1. Adjust nut under the FEED PLATE as necessary (Loosening the nut lightens the engagement, tightening the nut increases the engagement.)

2. Using one sheet of the paper that is to be folded, set SEPARATOR for the lightest possible pull, not permitting the feeding of doubles

D. Determine the fold settings

1. Set for standard fold on 8½" x 11" paper

   a. Use red lines on the calibrated charts
   b. Place paper with letterhead <u>trailing</u>

2. Set for accordion fold on 8½" x 11" paper

   a. Use red lines on the calibrated charts
   b. Place paper with letterhead <u>leading</u>

3. Set for single fold

   a. Depress the SINGLE FOLD DEFLECTOR
   b. Set the SECOND FOLD KNOB according to position of the crease

4. Set for double fold

   a. Fold a sample sheet by hand (Make by folding a sheet in half and then folding this in half again.)

   b. Measure the distance from the <u>leading</u> edge of the paper to the first crease using the SCALE on the SINGLE FOLD DEFLECTOR

   c. Set FIRST FOLD KNOB at the corresponding figure

   d. Repeat the procedure measuring from the first crease to the second crease and set the SECOND FOLD KNOB at the corresponding figure

5. Set for other folds

   a. Fold a sheet of paper by hand the way it should look after going through the machine

   b. Measure the distance from the <u>leading</u> edge of the paper to the first crease using the SCALE on the SINGLE FOLD DEFLECTOR

   c. Set FIRST FOLD KNOB at the corresponding figure

   d. Repeat the procedure measuring from the first crease to the second crease and set the SECOND FOLD KNOB at the corresponding figure

E. Check STACKER SPEED LEVER

1. Use upper position for high speed, normal feeding, and extra long paper

2. Use lower position for low speed and for intermittent feeding or small sheets

[redacted]

II. Operating the Folding Machine

A. Aerate and shingle paper

B. Place paper in FEED PLATE with letterhead leading or trailing according to fold being used.

C. Turn MOTOR SWITCH to ON

D. Stack automatically

E. Remove contents of the STACKER at reasonable intervals

F. Follow the above procedures until all material is folded

III. Completing job responsibilities

A. Turn MOTOR SWITCH to OFF

B. Remove <u>all</u> contents from STACKER

C. Replace cover on machine

D. Check all material folded and process according to instructions of the teacher

Student Participation

Let each student run a few pieces of paper through the machine, having each student set the machine for a different fold (Example: first student folds a few papers using the standard fold; the next student sets machine for an accordion fold). Proceed until all the students have had a chance to fold some papers

Supplementary Material

1. Explain to students that this FOLDING MACHINE may be attached to the Inserting Machine (The operator starts with unfolded sheets of paper. They come out of the machine folded and inserted into envelopes.)

2. Give students duplicated sheets containing specific information about the Folding Machine in the laboratory (They are responsible for learning this information.)

Skill Building

The students should develop the following skills.

1. Be able to identify the parts of the Folding Machine

2. Be able to set and operate efficiently the Folding Machine to make a standard fold, accordion fold, single fold, double fold, and other folds

6103

3. Position REAR PAPER GUIDE up to the paper, leaving about the thickness of a dime between paper and GUIDE, using the same procedure as above

C. Set the SEPARATOR for thickness

1. Adjust nut under the FEED PLATE as necessary (Loosening the nut lightens the engagement, tightening the nut increases the engagement.)

2. Using one sheet of the paper that is to be folded, set SEPARATOR for the lightest possible pull, not permitting the feeding of doubles.

6104

D. Determine the fold settings

1. Set for standard fold on 8½" x 11" paper

   a. Use red lines on the calibrated charts
   b. Place paper with letterhead trailing

2. Set for accordion fold on 8½" x 11" paper

   a. Use red lines on the calibrated charts
   b. Place paper letterhead leading

3. Set for single fold

   a. Depress the SINGLE FOLD DEFLECTOR
   b. Set the SECOND FOLD KNOB according to position of crease

4. Set for double fold

   a. Fold a sample sheet by hand (Made by folding a sheet in half and then folding this in half again.)
   b. Measure the distance from the leading edge of the paper to the first crease using the SCALE on the SINGLE FOLD DEFLECTOR
   c. Set FIRST FOLD KNOB at the corresponding figure
   d. Repeat the procedure measuring from the first crease to the second crease and set the SECOND FOLD KNOB at the corresponding figure

5. Set for other folds

   a. Fold a sheet of paper by hand the way it should look after going through the machine
   b. Measure the distance from the leading edge of the paper to the first crease using the SCALE on the SINGLE FOLD DEFLECTOR
   c. Set FIRST FOLD KNOB at the corresponding figure
   d. Repeat the procedure measuring from the first crease to the second crease and set the SECOND FOLD KNOB at the corresponding figure

E. Check STACKER SPEED LEVER

1. Use upper position for higher speed, normal feeding, and extra long paper

2. Use lower position for low speed and for intermittent feeding or small sheets

II. Operating the Folding Machine

A. Aerate and shingle paper

B. Place paper in the FEED PLATE with letterhead leading or trailing according to the fold being used

C. Turn MOTOR SWITCH to ON

6015

6105

D. Stack automatically

E. Remove contents of the STACKER at reasonable intervals

F. Follow the above procedures until all material is folded

III. Completing job responsibilities

A. Turn MOTOR SWITCH to OFF

B. Remove <u>all</u> contents from STACKER

C. Replace cover on machine

D. Check all material folded and process according to instructions of the teacher

Additional Information

The Folding Machine in the laboratory may be attached to the Inserting Machine. The Operator begins with unfolded sheets of paper and they come out of the machine folded and inserted into envelopes.

Skill Building

1. Know the parts of the Folding Machine

2. Following the Rotation Plan and team assignment, work at the Folding Machine until efficient in setting up and operating the machine to make the following folds.

   a. Standard
   b. Accordion
   c. Single
   d. Double
   e. Other

610

INSERTING MACHINE
INSERTING and FOLDING MACHINE
(Combined)

6107

INSERTING MACHINE

Teacher Material

Description	Pitney-Bowes Model 3300; most difficult machine in the laboratory to operate (The Folding Machine may be attached to this machine.)
Use	To stuff enclosures automatically, one at a time, into envelopes
New Term	Flapping envelopes--using a small stack of envelopes, inserting one flap under the other and then bending the flaps back
Activity	Provide each student with a small stack of envelopes (approximately 50) to practice flapping them

Machine Demonstration

I. Setting up the Inserting Maching

A. The FEEDER

1. SIDE GUIDES

a. Loosen the two LOCK KNOBS beneath the DECK
b. Place the enclosure between the SIDE GUIDES
c. Tighten the LOCK KNOBS after setting the GUIDES evenly according to the DECK MARKS and leaving the thickness of a dime between the enclosure and the GUIDES

2. SEPARATOR SHIELD

a. Examine the three-fingered STONE and the ADJUSTABLE SHIELD (Amount of STONE exposure should be the thickness of a dime. More STONE exposure is required when the paper is either heavy or rough-surfaced.)
b. Change the amount of STONE exposure by pushing or pulling the SHIELD HANDLE under the FEEDER

3. SEPARATOR GAP

a. Place one of the enclosures underneath the ROLLER up to--but not against--the STOP SWITCH ARM (If necessary, lower the STONE by turning the STONE ADJUSTMENT SCREW to the left.)
b. Turn the POWER and MOTOR SWITCHES to ON (This operates the FEED ROLLER. The POWER SWITCH remains on until job is completed.)
c. Raise the STONE by turning the STONE ADJUSTMENT SCREW clockwise until the ROLLER pulls the enclosure against STOP SWITCH ARM
d. Turn only the MOTOR SWITCH to OFF
e. Leave the enclosure there

6108 coia

B. RAM PICK-UP STATION

1. SIDE GUIDES

   a. Loosen both LOCK KNOBS on the SIDE GUIDES
   b. Set each SIDE GUIDE so that its DECK MARK is ¼" greater than the SIDE GUIDES on the FEEDER
   c. Tighten both LOCK KNOBS temporarily

2. GATE POSITION

   a. Measure the height of the enclosure
   b. Loosen the GATE KNOB and set its red pointer ¼" greater than the enclosure's height
   c. Tighten the GATE KNOB temporarily
   d. Turn the MOTOR SWITCH to ON
   e. Firmly hold the HANDWHEEL at the left end of the machine and press the FEED SWITCH, releasing the enclosure
   f. Turn only the MOTOR SWITCH OFF when the enclosure has stopped in the RAM PICK-UP STATION
   g. Loosen the GATE KNOB again
   h. Use the GATE KNOB to move the enclosure gently back toward the direction from which it came
   i. Tighten the GATE KNOB firmly as soon as the enclosure stops moving
   j. Turn only the MOTOR SWITCH to ON and OFF to move the enclosure into the STACKER
   k. Return enclosure to FEEDER TRAY

3. GATE TENSION

   a. Turn MOTOR SWITCH to ON
   b. Firmly hold the HANDWHEEL at the left end of the machine and press the FEED SWITCH, releasing the enclosure
   c. Turn the MOTOR SWITCH to OFF when the enclosure has stopped in the RAM PICK-UP STATION (If it slides or twists beyond the GATE, the GATE TENSION should be increased, but if its lead edge is crumpled, GATE TENSION should be lowered. If adjustment is needed, loosen the GATE TENSION ADJUSTING KNOB. Move to the right to increase tension and to the left to lower tension.)
   d. Loosen both SIDE GUIDE KNOBS and move each GUIDE in to the thickness of a dime from each end of the enclosure when the GATE TENSION checks correctly and the enclosure in RAM PICK-UP STATION lies straight
   e. Tighten both SIDE GUIDE KNOBS
   f. Turn the MOTOR SWITCH to ON and OFF to move the enclosure into the STACKER
   g. Return the enclosure to FEEDER TRAY

4. RAM PUSHER

   a. Turn MOTOR SWITCH to ON
   b. Firmly hold the HANDWHEEL at the left end of the machine and press the FEED SWITCH, releasing enclosure
   c. Let the HANDWHEEL slip slowly in your hand (The RAM PUSHER will move the enclosure to your left.)
   d. Turn the MOTOR SWITCH to OFF when the slotted SCREW in the RAM BLADE is to the left of the ENVELOPE LEDGE

6100 8010

e. Loosen this SCREW with a coin (penny or dime) and use it to position the RAM PUSHER (The RAM PUSHER must touch the enclosure's trail edge and the RAM BLADE tip is ahead of the enclosure by the thickness of a dime.)
f. Tighten the SCREW with a coin
g. Turn the MOTOR SWITCH to ON and OFF to move the enclosure into the STACKER
h. Return enclosure to the FEEDER TRAY

C. ENVELOPE-HOPPER STATION

1. SIDE GUIDE POSTS

a. Turn the SIDE GUIDE POSTS to slide them all the way out to the end of their DECK SLOTS
b. Lay an envelope between the SIDE GUIDE POSTS at equal DECK MARKS
c. Slide the SIDE GUIDE POSTS to within the thickness of a dime at each end of the envelope

2. FLAP GUIDE POSTS

a. Take an envelope and pull the flap out straight
b. Lay the envelope, flap out and throat down, against the LEDGE (Flap crease must be parallel and even with the edge of the LEDGE.)
c. Loosen the FLAP POST KNOBS and center each FLAP GUIDE POST between the tip of the flap and the end of the envelope holding the envelope crease and flap in the position described above
d. Move each FLAP GUIDE POST lightly against the flap, and tighten the FLAP GUIDE KNOBS

3. FENCE

a. Loosen the KNOBS at each end of the FENCE holding the envelope crease and flap in the position described above
b. Move the FENCE to the position where the back edge of the envelope can rest on the FENCE SHELF
c. Make sure the FENCE is close enough to confine the envelope, but not close enough to cause any squeeze (The thickness of a dime should be allowed.)
d. Tighten the KNOBS

D. Test run

1. Use one enclosure and one envelope to check adjustments

2. Turn MOTOR SWITCH to ON

3. Let the enclosure slide down the FEEDER TRAY until it hits the FEED ROLLER

4. Depress the FEED button (The enclosure should be stuffed into the envelope and the envelope dropped into the STACKER.)

5. Turn the MOTOR SWITCH to OFF

AIIA 6110

III. Completing job responsibilities

A. Turn the power and motor switches to OFF after the last enclosure is inserted

B. Remove unused envelopes

C. Remove stuffed envelopes

D. Replace cover on machine

E. Check inserted envelopes for accuracy

F. Take envelopes to Mailing Machine if postage is to be applied in the laboratory or count and box according to the instructions of the teacher

Student Participation

1. Give each student an opportunity to run a few enclosures through the machine while it is set up.

2. Have them remove the enclosures from the envelopes for future use.

Skill Building

Each student is to set up machine to insert at least 25 cards into small envelopes and reset machine to insert at least 25 letters into standard size envelopes. These two jobs will require making all the adjustments becuase of the different kinds of materials used. When completed the student is to remove the insertions from the envelopes so they may be used again.

The students should develop the following skills.

1. Be able to identify the parts of the Inserting Machine

2. Be able to set up and operate the Inserting Machine efficiently. (These two activities will require all adjustments to be made and be a good learning experience.)

   a. Insert letters into standard size envelopes
   b. Insert 4" x 6" cards into small envelopes (Remove insertions from the envelopes so they may be used again.)

6112

INSERTING MACHINE

Name_____

Team_____

Student Material
(To be duplicated and given to students)

Description	Pitney-Bowes Model 3300; most difficult machine in the laboratory to operate (The Folding Machine may be attached to this machine.)
Use	To stuff enclosures automatically, one at a time, into envelope
New Term	Flapping envelopes--using a small stack of envelopes inserting one flap under the other and then bending the flaps back

Operating Procedures

I. Setting up the Inserting Machine

A. The FEEDER

1. SIDE GUIDES

a. Loosen the two LOCK KNOBS beneath the DECK
b. Place the enclosure between the SIDE GUIDES
c. Tighten the LOCK KNOBS after setting the GUIDES evenly according to the DECK MARKS and leaving the thickness of a dime between the enclosure and the GUIDES

2. SEPARATOR SHIELD

a. Examine the three-fingered STONE and the ADJUSTABLE SHIELD (Amount of STONE exposure should be the thickness of a dime. More STONE exposure is required when the paper is either heavy or rough-surfaced.)
b. Change the amount of STONE exposure by pushing or pulling the SHIELD HANDLE under the FEEDER

3. SEPARATOR GAP

a. Place one of the enclosures underneath the ROLLER up to--but not against--the STOP SWITCH ARM (If necessary, lower the STONE by turning the STONE ADJUSTMENT SCREW to the left.)
b. Turn the POWER and MOTOR SWITCHES to ON (This operates the FEED ROLLER. The POWER SWITCH remains on until job is completed.)
c. Raise the STONE by turning the STONE ADJUSTMENT SCREW clockwise until the ROLLER pulls the enclosure against STOP SWITCH ARM (At this point, the FEED ROLLER will automatically stop.)
d. Turn only the MOTOR SWITCH to OFF
e. Leave the enclosure there

B. RAM PICK-UP STATION

1. SIDE GUIDES

a. Loosen both LOCK KNOBS on the SIDE GUIDES
b. Set each SIDE GUIDE so that its DECK MARK is ¼" greater than the SIDE GUIDES on the FEEDER
c. Tighten both LOCK KNOBS temporarily

2. GATE POSITION

a. Measure the height of the enclosure
b. Loosen the GATE KNOB and set its red pointer ¼" greater than the enclosure's height
c. Tighten the GATE KNOB temporarily
d. Turn the MOTOR SWITCH to ON
e. Firmly hold the HANDWHEEL at the left end of the machine and press the FEED SWITCH, releasing the enclosure
f. Turn only the MOTOR SWITCH to OFF when the enclosure has stopped in the RAM PICK-UP STATION
g. Loosen the GATE KNOB again
h. Use the GATE KNOB to move the enclosure gently back toward the direction from which it came.
i. Tighten the GATE KNOB firmly as soon as the enclosure stops moving
j. Turn only the MOTOR SWITCH on and off to move the enclosure into the STACKER
k. Return enclosure to FEEDER TRAY

3. GATE TENSION

a. Turn MOTOR SWITCH to ON
b. Firmly hold the HANDWHEEL at the left end of the machine and press the FEED SWITCH, releasing the enclosure
c. Turn the MOTOR SWITCH to OFF when the enclosure has stopped in the RAM PICK-UP STATION (If it slides or twists beyond the GATE, the GATE TENSION should be increased; but if its lead edge is crumpled, GATE TENSION should be lowered. If adjustment is needed, loosen the GATE TENSION ADJUSTING KNOB. Move to the right to increase tension and to the left to lower tension.)
d. Loosen both SIDE GUIDE KNOBS and move each GUIDE in to the thickness of a dime from each end of the enclosure when the GATE TENSION checks correctly and the enclosure in RAM PICK-UP STATION lies straight
e. Tighten both SIDE GUIDE KNOBS
f. Turn the MOTOR SWITCH to on and off to move the enclosure into the STACKER
g. Return the enclosure to FEEDER TRAY

4. RAM PUSHER

a. Turn MOTOR SWITCH to ON
b. Firmly hold the HANDWHEEL at the left end of the machine and press the FEED SWITCH, releasing the enclosure

611[illegible]

c. Let the HANDWHEEL slip slowly in your hand (The RAM PUSHER will move the enclosure to your left.)
d. Turn the MOTOR SWITCH to OFF when the slotted SCREW in the RAM BLADE is to the left of the ENVELOPE LEDGE
e. Loosen this SCREW with a coin (penney or dime) and use it to position the RAM PUSHER (The RAM PUSHER must touch the enclosure's trail edge and the RAM BLADE tip is ahead of the enclosure by the thickness of a dime
f. Tighten the SCREW with the coin
g. Turn the MOTOR SWITCH to ON and OFF to move the enclosure into the STACKER
h. Return enclosure to the FEEDER TRAY

C. ENVELOPE-HOPPER STATION

1. SIDE GUIDE POSTS

a. Turn the SIDE GUIDE POSTS to slide them all the way out to the end of their DECK SLOTS
b. Lay an envelope between the SIDE GUIDE POSTS at equal DECK MARKS
c. Slide the SIDE GUIDE POSTS to within the thickness of a dime at each end of the envelope

2. FLAP GUIDE POSTS

a. Take an envelope and pull the flap out straight
b. Lay the envelope, flap out and throat down, against the LEDGE (Flap crease must be parallel and even with the edge of the LEDGE.)
c. Loosen the FLAP POST KNOBS and center each FLAP GUIDE POST between the tip of the flap and the end of the envelope holding the envelope firmly in this position
d. Move each FLAP GUIDE POST lightly against the flap and tighten the FLAP GUIDE KNOBS

3. FENCE

a. Loosen the KNOBS at each end of the FENCE holding the envelope crease and flap in the position described above
b. Move the FENCE to the position where the back edge of the envelope can rest on the FENCE SHELF
c. Make sure the FENCE is close enough to confine the envelope, but not close enough to cause any squeeze (The thickness of a dime should be allowed.)
d. Tighten the KNOBS

D. Test run

1. Use one enclosure and one envelope to check adjustments

2. Turn MOTOR SWITCH to ON

3. Let the enclosure slide down the FEEDER TRAY until it hits the FEED ROLLER

4. Depress the FEED button (The enclosure should be stuffed into the envelope and the envelope dropped into the STACKER.)

5. Turn the MOTOR SWITCH to OFF

6. Examine the stuffed envelope to see if the enclosure is placed in the envelope correctly and if not, recheck adjustments and do another test run

7. Begin the job if the envelope is stuffed correctly

II. Operating the Inserting Machine

A. Envelopes

1. Flap the envelopes and bend flaps properly

2. Fan the envelopes

3. Place envelopes in the HOPPER throat down with creases aligned to the LEDGE with bottom edge of lowest envelope resting on the FENCE SHELF

4. Keep stack of envelopes in HOPPER at least one inch high

5. Add envelopes carefully so the evenness of the stack will not become distorted

B. Enclosures

1. Fan enclosures

2. Place a stack of enclosures at the top of the FEED TRAY

3. Lean enclosures slightly forward against the fingers of the left hand

4. Tilt the enclosures in the opposite direction on the FEED TRAY with the left hand

5. Let enclosures slide down the FEED TRAY

6. Guide the stack lightly until the top enclosure contacts the FEED ROLLER

7. To add move enclosures, lift the trailing edge of last enclosure of the old stack and let the new ones slide under

C. Continuous operation

1. Turn MOTOR SWITCH to ON

2. Press the FEED button (Continuous, automatic operation should begin.)

3. Add flapped envelopes before the stack drops below one inch high

611818

4. Add enclosures before stack is used up

5. Remove stuffed envelopes from STACKER at intervals

III. Completing job responsibilities

A. Turn the POWER and MOTOR SWITCHES off after the last enclosure is inserted

B. Remove unused envelopes

C. Remove stuffed envelopes

D. Replace cover on machine

E. Check inserted envelopes for accuracy

F. Take envelopes over to Mailing Machine if postage is to be applied in the laboratory or count and box according to the instructions of the teacher

Skill Building

1. Know the parts of the Inserting Machine

2. Know how to set up and operate efficiently the Inserting Machine following the Rotation Plan and team assignment

3. Do the following jobs

   a. Insert letters into standard size envelopes
   b. Insert 4" x 6" cards into small envelopes
   c. Remove the insertions from the envelopes so that they may be used again

6117

INSERTING AND FOLDING MACHINES COMBINED

Teacher Material

Description	Pitney-Bowes Inserter 3300 and Folder FH combined
Use	Automatically folds and stuffs enclosures in one continuous operation

Combining the Machines

I. Preparing the Inserting Machine by removing the FEEDER

A. Unplug FEEDER by removing plug from socket

B. Remove FEEDER MOUNTING BRACKET

1. Unscrew thumb screws

2. Push away from control panel until flexible SHAFT is free

II. Preparing the Folding Machine

A. Remove the FEED PLATE, GUIDE SPRINGS and STACKER TRAY

B. Remove the DEFLECTOR CLIPS and position the STACKER LEVER <u>down</u>

III. Combining the Machines

A. Place Folder on top of the sub-base and slide it <u>towards</u> the Inserter <u>between</u> the edges of the sub-base

B. When the Folder is about a finger width from the Inserter, press down on the Folder and continue to slide it towards the Inserter until the Folder is locked in place by the hook on the sub-base

C. Plug the Folder power plug into the Inserter

1. Depress POWER and MOTOR SWITCHES of the Inserter to ON

2. Depress MOTOR SWITCH of the Folder to ON

D. Attach the FEEDER on the Folder in place of the original FEED PLATE

E. Plug FEEDER plug into the receptacle on the CONTROL PANEL

F. Set the Folder for the proper fold size

G. Check the SINGLE FOLD DEFLECTOR to see if it is in the correct position

Class Participation

Give each team the opportunity to combine the Folding and Inserting Machines, following each step while the remainder of the class observes.

Skill Building

Following the Rotation Plan and team assignment the students should be able to set up and operate efficiently the combined machines.

1. Depress POWER and MOTOR SWITCHES of the Inserter to ON

2. Depress MOTOR SWITCH of the Folder to ON

D. Attach the FEEDER on the Folder in place of the original FEED PLATE

E. Plug FEEDER plug into the receptacle on the CONTROL PANEL

F. Set the Folder for the proper fold size

G. Check the SINGLE FOLD DEFLECTOR to see if it is in the correct position

Skill Building

Know how to set up and operate efficiently the two machines combined

6120

KEYBOARD

EMBOSSING MACHINE

Note: A unit on the Zip Code must precede the teaching of the Embossing Machine.

KEYBOARD EMBOSSING MACHINE

Description	Pitney-Bowes Model 795
Use	Emboss metal PLATES to be used for printing purposes
New Terms	Emboss--raise from a surface
	Blank-out--flatten embossed surface of date PLATE
	Tab--an insert used on data PLATE (various colors available)
	Sight Strip-- special strip of paper which will fit on the back PLATE to provide information (various colors available)

Machine Demonstration

I. Setting up Embossing Machine

A. Remove cover and put in a safe place

B. Using the LINE SPACING KNOB, move the PLATE HOLDER toward you to its forward stop (In this position the LINE INDICATOR will be set at one.)

C. Insert a blank PLATE into the PLATE HOLDER with the reading side up and the straight edge toward the operator

D. Pull the PLATE RELEASE LATCH toward you and, at the same time, depress the forward edge of the PLATE (The PLATE should lock snugly in the PLATE HOLDER.)

E. Observe COLUMN INDICATOR and position CARRIAGE to the desired embossing position (Line 2, column #1)

II. Operating the Embossing Machine

A. Depress KEY to emboss the desired character (As the embossing stroke is completed, CARRIAGE automatically advances one space (column) to right. The next KEY can be depressed only after the previous embossing cycle is completed. When two KEYS are engaged at approximately the same time, a stoppage may occur. When this happens, depress the CLEAR KEY ⊗ to relieve the stoppage and then resume embossing.)

B. Continue embossing until the line is complete and then depress CARRIAGE RETURN KEY ⊕ to reposition the plate to its left margin and to advance plate to the next line (The LINE INDICATOR should now be positioned at 3.)

C. Complete the next line and the embossing on the remainder of the plate in the manner described

[redacted]

D. Proofread PLATE always (If an error is observed, the incorrect character(s) may be removed by blanking-out.)

1. Visually position the PLATE to proper line and column (The COLUMN INDICATOR should be aligned with the character to be removed.)

2. Depress BLANKING KEY (red) one time to blank out each character to be removed

3. Reemboss by backspacing to space blanked out on the PLATE and operate the machine in the normal manner

4. Emboss a new PLATE if error requires a large area of PLATE to be blanked out

III. Completing job responsibilities

A. Turn MOTOR SWTICH to OFF

B. Remove PLATE

C. Replace cover on machine

Student Participation

Give each student the opportunity to sit down at the Embossing Machine, insert a PLATE, position it, type his own name, and remove the PLATE. The same PLATE may be used for embossing until it is filled.

Supplementary Materials for Data Plates and Student Participation

1. Tabs

a. Show examples
b. Tell why used (Tabs indicate essential information to the businessman. Different colors or tab positions indicate different information.)
c. Have students insert tabs on a plate and remove them
d. Show pictures of different kinds of tabs available

2. Sight strips

a. Show examples
b. Tell why used (Sight-strips identify a plate in the Addresser-Printer. Many times the same material is not sent to all patrons.)
c. Explain how to type

(1) Points going upward
(2) Use variable line spacer
(3) Type first information as on first line of embossed PLATE
(4) Show how to cut sight strip and insert into PLATE
(5) Have students cut and insert a SIGHT STRIP into PLATE

3. Give out duplicated sheets containing specific information about the Embossing Machine in the laboratory (The students are responsible for learning this information.)

Skill Building

The student should develop the following skills.

1. Learn parts of the Embossing Machine

2. Compile five addresses--complete with name, street address, city, state and correct Zip Code

3. Following the Rotation Plan and team assignments, use these addresses to emboss five plates, type SIGHT STRIP for each, and insert into correct PLATE

6124

KEYBOARD EMBOSSING MACHINE

Name_____

Team_____

Student Material
(To be duplicated and given to students)

Description	Pitney-Bowes Model 795
Use	Emboss metal PLATES to be used for printing purposes
New Terms	Emboss--raise from a surface
	Blank-out--flatten embossed surface of PLATE
	Tab--an insert used on PLATE (various colors available)
	Sight Strip--special strip of paper which will fit on the back of a PLATE to provide information (various colors available)

Operating Procedures

I. Setting up the Embossing Machine

A. Remove cover and put in a safe place

B. Using the LINE SPACING KNOB, move the PLATE HOLDER toward you to its forward stop (In this position the LINE INDICATOR will be set at one.)

C. Insert a blank PLATE into the PLATE HOLDER with the reading side up and the straight edge toward the operator

D. Pull the PLATE RELEASE LATCH toward you and, at the same time, depress the forward edge of the PLATE (The plate should lock snugly in the PLATE HOLDER.)

E. Observe COLUMN INDICATOR and position CARRIAGE to the desired embossing position (Line 2, column 1)

II. Operating the Embossing Machine

A. Depress KEY to emboss the desired character (As the embossing stroke is completed, CARRIAGE automatically advances one space (column) to right. The next KEY can be depressed only after the previous embossing cycle is completed. When two KEYS are engaged at approximately the same time, a stoppage may occur. When this happens, depress the CLEAR KEY ⊗ to relieve the stoppage and then resume embossing.)

B. Continue embossing until the line is complete and then depress CARRIAGE RETURN KEY ⊖ to reposition the plate to its left margin and to advance plate to the next line (The LINE INDICATOR should be positioned at 3.)

6125

C. Complete the next line and the embossing on the remainder of the plate in the manner described

D. Proofread PLATE always (If an error is observed, the incorrect character(s) may be removed by blanking out.)

1. Visually position the PLATE to proper line and column (The COLUMN INDICATOR should be aligned with the character to be removed.)

2. Depress BLANKING KEY (red) one time to blank out each character to be removed

3. Reemboss by backspacing to space blanked out on the PLATE and operate the machine in the normal manner

4. Emboss a new PLATE if error requires a large area of PLATE to be blanked out

III. Completing of job responsibilities

A. Turn MOTOR SWITCH to OFF

B. Remove PLATE

C. Replace cover on machine

Skill Building

1. Know parts of Embossing Machine (See Glossary below.)

2. Compile five addresses complete with name, street, address, city, state, and correct zip code

3. Following the Rotation Plan and team assignment use the complete addresses in doing the following

a. Emboss five PLATES, proofread, and make any corrections
b. Type five SIGHT STRIPS correctly and insert in back of PLATE

Glossary

Name	What It Is and What It Does
1. Line Indicator	Identifies the addresser plate line in position to be embossed
2. Line Spacing Knob	Facilitates the manual alignment or setting of the addresser plate in relation to the plate holder scale (Knob may be rotated in either direction until plate positioning is achieved.)
3. Power Control Knob	Switches the machine ON or OFF

4.	Keyboard	The keyboard is almost identical in appearance and function to the keyboard on a standard typewriter
5.	Power ON Indicator	When illuminated, indicates that the power is ON
6.	Column Indicator	Identifies the vertical column on the addresser plate in position to be embossed
7.	Carriage	Houses the plate holder and the mechanism to control both forward/rear and left/right positioning of the addresser plate
8.	Plate Holder	Adjustable device permitting forward and reverse movement of plate for embossing on succeeding lines (Has handle to facilitate release of plate from plate frame.)

9. Model 795/796 Standard Keyboard

   a. The carriage release key moves the carriage toward its left stop position (right-hand margin of addresser plate). When the optional stop-type tabulator is installed, the key can be used to stop the carriage at predetermined positions to speed embossing operations.
   b. The blanking key is used to blank-out (remove) embossed characters from an addresser plate.
   c. The clear key is used to free a stoppage which may be caused when two keys are engaged at the same time. The key can be used for both upper and lower case characters.
   d. The back space key positions the carriage one space (column) to the right.
   e. The shift keys are used when upper case (capital) letters are desired and to select the top character on a key having two symbols, such as the key. The use of the shift key is required to emboss the asterisk.
   f. The space bar positions the carriage one space in direction of embossing.
   g. The shift lock key locks the shift mechanism so that it is not necessary to hold either shift key depressed during long runs of upper case embossing.
   h. The carriage return key returns the carriage to the extreme right stop position (left-hand margin of addresser plate) and automatically advances the addresser plate one line. The key must be held down until <u>after</u> the plate holder has advanced to the next line.

6127

ADDRESSER-PRINTER

ADDRESSER-PRINTER

Teacher Material

Description	Pitney-Bowes Model 730 with push button controls
Use	Prints information from embossed plates

Machine Demonstration

I. Setting up the Addresser-Printer

A. Remove cover and put in a safe place

B. Check REPEATER CONTROL--should be on one (If more than one print per plate is desired, check below for procedures.)

C. Load plates in the PLATE FEED HOPPER

1. Raise type side of plates <u>up</u>

2. Place notched edges of the plates to the rear

3. Place PLATE WEIGHT on top of plates

D. Advance first plate into SIGHT STATION by depressing the SKIP button

E. Locate print position

1. Draw a <u>vertical</u> <u>line</u> on the paper where the <u>left</u> edge of the print should appear

2. Draw a <u>horizontal</u> <u>line</u> where the <u>top</u> of the printing should appear

3. Put the paper in the PRINT STATION against the MAGNETIC FORM GUIDES wherever they happen to be and print one plate by pushing the CONSEC. button.

4. Compare the location of the print to the pencil lines and adjust the MAGNETIC FORM GUIDES accordingly.

5. Print the same plate by pushing the REPEAT button and check to see if the print location is accurate

6. If the print location is correct, begin the job.

7. If print location is still not correct, repeat items 4 and 5 above

II. Operating the Addresser-Printer

A. Put paper in PRINT STATION against MAGNETIC FORM GUIDES and press the REPEAT button to print the first plate

6129

6130

B. Continue printing by selecting the correct button from the PRINT CONTROL PANEL

1. Depress CONSEC. when you see the plate you wish to print in the SIGHT STATION

2. Depress SKIP if you wish to skip over a plate without printing it

3. Depress REPEAT after you have made your first print, if you want to make more than one print (Make as many repeat prints as you need.)

C. Use REPEATER CONTROL for 2, 3, or an infinite number of prints from one plate

1. Load plates as you normally do

2. Set REPEATER CONTROL LEVER to desired setting

a. To print each plate 2 or 3 times

(1) Set REPEATER CONTROL LEVER at position 2 or 3 respectively
(2) Turn REPEATER TIMING KNOB counterclockwise so that the point on the knob matches the white dot on the DECK
(3) Depress SKIP button to advance first place into PRINT STATION
(4) Insert form to be printed into PRINT STATION
(5) Depress CONSEC. button and to get first print of desired number

b. To print each plate 4 or an infinite number of times

(1) Set REPEATER CONTROL LEVER at position 1
(2) Depress SKIP button to advance first plate into PRINT STATION
(3) Set REPEAT CONTROL at ∞
(4) Insert form to be printed into PRINT STATION
(5) Depress CONSEC. button for desired number of repeats

III. Completing of job responsibilities

A. Eject the last plate using the SKIP button

B. Turn MOTOR SWITCH to OFF

C. Unload the PLATE RECEIVER

D. Replace cover on machine

E. Check and proof printed matter

1. Make sure you have correct number of prints per plate

2. Make sure you have all the plates and that they are in the order received from the patron

6130

Student Participation

Give each student an opportunity to address several envelopes to get the "feel" of the machine. Have different sizes of envelopes and paper so the MAGNETIC FORM GUIDES will have to be moved. The remainder of the class will observe.

Supplementary Materials

1. Show students pictures of other Addresser-Printers.

2. Give students duplicated sheets containing specific information about the Addresser-Printer in the laboratory (The students are responsible for learning this information.)

Skill Building

The students should develop the following skills.

1. Be able to identify the parts of the Addresser-Printer

2. Be able to set up and operate the Addresser-Printer efficiently

3. Following the Rotation Plan and team assignment, set the machine and do the following jobs using the five plates you embossed

   a. Address five small envelopes
   b. Address five standard envelopes
   c. Address five invoices for window envelopes

6131

ADDRESSER-PRINTER

Name_____

Team_____

Student Material
(To be duplicated and given to the students)

Description	Pitney-Bowes Model 730 with push button controls
Use	Prints information from embossed plates

Operating Procedures

I. Setting up the Addresser-Printer

A. Remove cover and put in a safe place

B. Check REPEATER CONTROL--should be on one (If more than 1 print per plate is desired, check below for procedures.)

C. Load plates in the PLATE FEED HOPPER

1. Raise type side of plates <u>up</u>

2. Place notched edges of the plates to the rear

3. Place PLATE WEIGHT on top of plates

D. Advance first plate into SIGHT STATION by depressing the SKIP button

E. Locate print position

1. Draw a <u>vertical line</u> on the paper where the <u>left</u> edge of the print should appear

2. Draw a <u>horizontal line</u> where the <u>top</u> of the printing should appear

3. Put the paper in the PRINT STATION against the MAGNETIC FORM GUIDES wherever they happen to be and print one plate by pushing the CONSEC. button

4. Compare the location of the print to the pencil lines and adjust the MAGNETIC FORM GUIDES accordingly

5. Print the same plate by pushing the REPEAT button and check to see if you now have the print location desired

6. If the print location is correct, begin the job

7. If the print location is still not correct, repeat Items 4 and 5 above

II. Operating the Addresser-Printer

A. Put paper in PRINT STATION against MAGNETIC FORM GUIDES and press the REPEAT button to print the first plate

8132

B. Continue printing by selecting the correct button from the PRINT CONTROL PANEL

1. Depress CONSEC. when you see the plate you wish to print in the SIGHT STATION

2. Depress SKIP if you wish to skip over a plate without printing it

3. Depress REPEAT after you have made your first print, if you want to make more than one print (Make as many repeat prints as you need.)

C. Use REPEATER CONTROL for 2, 3, or an infinite number of prints from one plate

1. Load plates as you normally do

2. Set REPEATER CONTROL LEVER to desired setting

a. To print each plate 2 or 3 times

(1) Set REPEATER CONTROL LEVER at position 2 or 3 respectively
(2) Turn REPEATER TIMING KNOB counterclockwise so that the point on the knob matches the white dot on DECK
(3) Depress SKIP button to move plate into SIGHT STATION
(4) Insert form to be printed into PRINT STATION
(5) Depress CONSEC. button to get first print of desired number

b. To print each plate 4 or an infinite number of times

(1) Set REPEATER CONTROL LEVER at position 1
(2) Depress SKIP button to advance first plate into PRINT STATION
(3) Set REPEAT CONTROL at ∞
(4) Insert form to be printed into PRINT STATION
(5) Depress CONSEC. button for desired number of repeats

III. Completing of job responsibilities

A. Eject the last plate using the SKIP button

B. Turn MOTOR SWITCH to OFF

C. Unload the PLATE RECEIVER

D. Replace cover on machine

E. Check and proof printed matter

1. Make sure you have correct number of prints per plate

2. Make sure you have all the plates and that they are in the order received from the patron

Skill Building

1. Know the parts of the Addresser-Printer

2. Know how to set up and operate the Addresser-Printer efficiently

3. Following the Rotation Plan and team assignment set the machine and do the following jobs using the five plates you embossed

[illegible] Address five small envelopes
[illegible] Address five standard envelopes
c. Address five invoices for window envelopes

MAILING MACHINE

6134

MAILING MACHINE

Teacher Material

Description	Pitney-Bowes Model 5600 with Pitney-Bowes Meter 5309 which automatically feeds and prints stamps with a machine feed rate of 170 letters per minute
Use	Seals and stamps envelopes and imprints postage on tape for packages that cannot be run through the machine

Machine Demonstration

I. Setting up the Mailing Machine

A. For printing and sealing

1. Move OPERATING LEVER to Operate

2. Check SEPARATOR and adjust to allow feeding of the bottom letter while holding back the remainder of the stack

3. Set the FRONT GUIDE by placing the leading edge of letter between it and the block on the FENCE at the left of the SEPARATOR

4. Move the LETTER PROP left or right by squeezing together the handle and plate at left of LETTER PROP and sliding it in track (The trailing edge of the bottom letter should be against the center of the supporting surface of the LETTER PROP.)

5. Position the STACKER at the right according to the length of the envelopes (It may be removed for convenience during tape runs.)

6. Set date on METER

   a. Raise the DATER COVER
   b. Move the plastic wheels so that the date to be printed is aligned with the DATE INDEX

7. Turn LETTER FEED SWITCH to ON and check machine adjustments by running a sample envelope through the machine

8. Turn LETTER FEED SWITCH to OFF

9. Use screw driver to remove SAFETY PLATE if date and other adjustments are correct

10. Move SETTING LEVERS at the top of the machine to required amount of postage

11. Look in INDICATOR WINDOW to make sure the machine is set for the correct amount

6135
6136

B. For printing only--Run envelopes the same as for printing and sealing, but with flaps closed

C. For sealing only--Center the OPERATING LEVER between REMOVE and OPERATE and run the machine the same as for printing and sealing

II. Operating the Mailing Machine

A. Fan and jog envelopes and make sure that each flap is extending over that of the preceding envelope

B. Turn the LETTER FEED SWITCH to ON

C. Continue to add to the stack of envelopes while the machine automatically feeds and prints stamps

III. Completing job responsibilities

A. Turn LETTER FEED SWITCH to OFF

B. Return SETTING LEVERS to zero

C. Replace SAFETY PLATE and replace screw with screw driver

D. When the last mail for the day has gone through the machine, record in DAILY RECORD OF METER REGISTER READINGS

1. Record the amount of the ASCENDING REGISTER on the METER in Column A (The Ascending Register is the total of all postage used.)

2. Record the amount of the DESCENDING REGISTER in Column B (The DESCENDING REGISTER shows the balance of postage on hand.)

3. Total Column A and B in Column C. Column C must always agree with the last entry made by the postal employee at the time of the last setting of METER

4. Place OPERATING LEVER to LOCK and lock with key

E. Place cover on machine

F. Check all envelopes to make sure postage is on each

G. Bundle according to instructions using pressure-pensive labels furnished by the Post Office for "Local" and "Out of Town"

IV. Additional Meter Information

A. Specifications

1. Setting capacity--$9999.99

2. Meter Stamp--Minimum 1¢, Maximum $9.99 (Meter automatically ceases to operate when DESCENDING REGISTER is below $2.00)

6136

B. To remove meter

1. Move OPERATING LEVER to REMOVE

2. Lift the METER straight up

C. To install METER

1. Keep OPERATING LEVER at REMOVE

2. Grasp the METER HANDLE and guide the METER to the left rear corner above the METER TABLE

D. To acquire additional postage in METER

1. Remove METER as explained

2. Place METER in carrying CASE

3. Obtain check made out to the Postmaster for the amount of postage desired

4. METER, DAILY RECORD OF METER REGISTER READINGS, and check must be presented to employee at the Post Office

5. Install METER as explained

6. Place OPERATING LEVER to LOCK and lock machine with key

E. For Tape Operation only

1. Position TAPE DEFLECTOR for wet or dry tape

2. Remove SAFETY PLATE

3. Look in INDICATOR WINDOW to make sure you have set the correct amount of postage

4. Depress TAPE TRIP LEVER (The LETTER FEED SWITCH does not have to be on for tape operation.)

5. Show class sample tape with "00" in the amount for postage

V. Postal regulations governing metered mail

A. Bundle 5 or more letter-type pieces of metered mail with the addresses facing in one direction

B. Bundle Special Delivery and Air Mail separately

C. Deliver to the Post Office on the date shown on the meter stamp

613713

Student Participation

1. Give each student the opportunity to run a few envelopes through the Mailing Machine. They will seal and look like the real postage except in the amount space will be "00"

2. Let each student depress the TAPE TRIP LEVER and remove a dry tape for his own

3. Give students duplicated sheets containing specific information about the mailing machine in the laboratory. They are responsible for learning this information

Supplementary Material

1. Show samples of different metered mail--some with advertisements

2. Show where brand initials and meter numbers are on samples

Skill Building

The student should develop the following skills.

1. Be able to identify parts of the Mailing Machine

2. Know how to set up the Mailing Machine for the following operations

   a. Printing and sealing
   b. Printing only
   c. Sealing only
   d. Tape operation

3. Be able to remove and install the METER, and record entries in the DAILY RECORD OF METER REGISTER READINGS

615610

Team_____

Student Material
(To be duplicated and given to students)

Description	Pitney-Bowes Model 5600 with Pitney-Bowes Meter 5309 which automatically feeds and prints stamps with a machine feed rate of 170 letters per minute
Use	Seals and stamps envelopes and imprints postage on tape for packages that cannot be run through the machine

Operating Procedures

I. Setting up the Mailing Machine

A. For <u>printing and sealing</u>

1. Move OPERATING LEVER to <u>Operate</u>

2. Check SEPARATOR and adjust to allow feeding of the <u>bottom</u> letter while holding back the remainder of the stack

3. Set the FRONT GUIDE by placing the <u>leading</u> edge of letter between it and the block on the FENCE at the <u>left</u> of the SEPARATOR

4. Move the LETTER PROP left or right by squeezing together the handle and plate at <u>left</u> of LETTER PROP and sliding it in track. (The <u>trailing</u> edge of the <u>bottom</u> letter should be against the center of the supporting surface of the LETTER PROP.)

5. Position the STACKER at the <u>right</u> according to the length of envelopes (It may be removed for convenience during tape runs.)

6. Set date on METER

   a. Raise the DATER COVER
   b. Move the plastic wheels so that the date to be printed is aligned with the DATE INDEX

7. Turn LETTER FEED SWITCH to ON and check machine adjustments by running a sample envelope through the machine

8. Turn LETTER FEED SWITCH to OFF

9. Use screw driver to remove SAFETY PLATE if date and other adjustments are correct

10. Move SETTING LEVERS at the <u>top</u> of the machine to required amount of postage

11. Look in INDICATOR WINDOW to make sure the machine is set for the correct amount

6139 0019

B. For printing only--Run the envelopes the same as for printing and sealing, but with flaps closed

C. For sealing only--Center the OPERATING LEVER between REMOVE and OPERATE and run the machine the same as for printing and sealing

II. Operating the Mailing Machine

A. Fan and jog envelopes and make sure that each flap is extending over that of the preceding envelope

B. Turn the LETTER FEED SWITCH to ON

C. Continue to add to the stack of envelopes while the machine automatically feeds and prints stamps

III. Completing job responsibilities

A. Turn LETTER FEED SWITCH off

B. Return SETTING LEVERS to zero

C. Replace SAFETY PLATE and replace screw with screw driver

D. When the last mail for the day has gone through the machine, record in DAILY RECORD OF METER REGISTER READINGS

1. Record the amount of the ASCENDING REGISTER on the METER in Column A (ASCENDING REGISTER is the total of all postage used.)

2. Record the amount of the DESCENDING REGISTER in Column B (The DESCENDING REGISTER shows the balance of postage on hand.)

3. Total Columns A and B in Column C. Column C must always agree with the last entry made by the postal employee at the time of the last setting of METER

4. Place OPERATING LEVER to LOCK and lock with key

E. Place cover on machine

F. Check all envelopes to make sure postage is on each

G. Bundle according to instructions using pressure sensitive labels marked "Local" and "Out of Town" obtained from the Post Office

IV. Additional METER information

A. Specifications

1. Setting capacity--$9999.99

2. Meter Stamp--Minimum 1¢, Maximum $9.99 (Meter automatically ceases to operate when DESCENDING REGISTER is below $2.00.)

B. To remove METER

1. Move OPERATING LEVER to REMOVE

2. Lift the METER straight up

C. To install METER

1. Keep OPERATING LEVER at REMOVE

2. Grasp the METER HANDLE and guide the METER to the left rear corner above the METER TABLE

D. To acquire additional postage in METER

1. Remove METER as explained

2. Place METER in carrying CASE

4. METER, DAILY RECORD OF METER REGISTER READINGS, and check must be presented to employee at the Post Office

5. Install METER as explained

6. Place OPERATING LEVER to LOCK and lock machine with key

E. For TAPE OPERATION only

1. Position TAPE DEFLECTOR for wet or dry tape

2. Remove SAFETY PLATE

3. Select amount of postage

4. Look in INDICATOR WINDOW to make sure you have set the correct amount

5. Depress TAPE TRIP LEVER (The LETTER FEED SWITCH does not have to be on for tape operation.)

V. Postal regulations governing metered mail

A. Bundle 5 or more letter-type pieces of metered mail with the addresses facing in one direction

B. Bundle Special Delivery and Air Mail separately

C. Deliver to the Post Office on the date shown on the meter stamp

6141S&P

Skill Building

1. Know the parts of the Mailing Machine

2. Know how to set up and operate efficiently the Mailing Machine for the following operations

   a. Printing and sealing
   b. Printing only
   c. Sealing only
   d. Tape operation

3. Know how to remove and install the METER, and record entries in the DAILY RECORD OF METER REGISTER READINGS

PARCEL POST SCALE

AND

SCALES

Note: A unit on the classes of mail and services offered by the Post Office must precede the teaching of the two scales in the laboratory.

PARCEL POST SCALE

Teacher Material

Description	Pitney-Bowes Model 3700
Use	To determine the amount of postage for parcels
New Term	Oscillation--the rocking back and forth of a scale drum after a parcel has been placed on the PLATFORM

Machine Demonstration

I. Setting up the Parcel Post Scale

A. Remove cover from machine and place in a safe place

B. Level by manipulating the two ADJUSTABLE FEET in the front of the BASE until the BUBBLE in the BULLS-EYE LEVEL is centralized

II. Operating the Scale

A. Place parcel on the PLATFORM

B. Determine zone

1. Obtain OFFICIAL ZONE CHART from your local Post Office and place on wall or bulletin board by Scales

2. Use the prefix (first three digits) of the Zip Code of the Post Office to which the parcel is addressed and refer to the chart for the zone

3. Depress ZONE SHUTTER of the correct zone (The ZONE SHUTTER will automatically return to closed position when a second shutter is depressed or when the parcel is removed from the PLATFORM.)

C. Determine the amount of postage in two-ounce graduations using STRIP RATE CHART (SURFACE RATE will appear in the white column and AIR PARCEL POST RATE will appear in the blue column.)

D. Go to Mailing Machine, and acquire tape showing correct amount of postage

E. Attach tape to parcel

III. Completing job responsibilities

A. Remove parcel from scales

B. Place cover on scales

6144

Student Participation

1. Let all the students determine an amount of postage while the remainder of the class observes

2. Have several packages wrapped, each weighing a different amount

3. Give each student a different Zip Code for his parcel

4. Have the student refer to the OFFICIAL ZONE CHART, determine the zone, depress the correct ZONE SHUTTER, and tell the amount of postage necessary for SURFACE RATE and AIR PARCEL POST RATE

Supplementary Material

1. Show the students maps that were previously used to determine the zone. Compare the use of the map with the use of the OFFICIAL ZONE CHART which is much easier

2. Give students duplicated sheets containing specific information about the Parcel Post Scales in our laboratory (They are responsible for learning this information.)

Skill Building

Following the Rotation Plan and team assignment, the student is to spend the amount of time necessary to learn how to perform the following correctly.

1. Identify parts of Parcel Post Scales

2. LEVEL Scales

3. Determine zone

4. Determine correct amount of postage for a parcel

8618
0145

PARCEL POST SCALE

Student Material
(To be duplicated and given to students)

Description	Pitney-Bowes Model 3700
Use	To determine the amount of postage for parcels
New Term	Oscillation--the rocking back and forth of a scale drum after a parcel has been placed on the PLATFORM

Operating Procedures

I. Setting up the Parcel Post Scales

A. Remove cover from machine and place in a safe place

B. Level by manipulating the two ADJUSTABLE FEET in the front of the BASE until the BUBBLE in the BULLS-EYE LEVEL is centralized

II. Operating the scales

A. Place parcel on the PLATFORM

B. Determine zone

1. Use OFFICIAL ZONE CHART posted near the Scales

2. Use the PREFIX (first three digits) of the Zip Code of the Post Office to which the parcel is addressed and refer to the chart for the zone

3. Depress ZONE SHUTTER of the correct zone (The ZONE SHUTTER will automatically return to closed position when a second shutter is depressed or when the parcel is removed from the PLATFORM.)

C. Determine the amount of postage, using STRIP RATE CHART in two-ounce graduation (SURFACE RATE will appear in the white column and AIR PARCEL POST RATE will appear in the blue column.)

D. Go to Mailing Machine and acquire tape showing correct amount of postage

E. Attach tape to parcel

III. Completing job responsibilities

A. Remove parcel from PLATFORM

B. Place cover on scales

Skill Building

Following the Rotation Plan and team assignment spend the necessary amount of time to learn how to perform the following correctly.

1. Identify parts of Parcel Post Scales

2. LEVEL Scales

3. Determine zone

4. Determine correct amount of postage for a parcel

SCALES

Teacher Material

Description	Pitney-Bowes Model S-510 with "throw-over poise"
Use	To determine the amount of postage through 10 pounds

Machine Demonstration

I. Setting up the Scale

A. Remove cover and place in a safe place

B. Level by manipulating the ADJUSTABLE FEET in the BASE until the BUBBLE in the BULLS-EYE LEVEL is centralized

II. Operating the Scale

A. Place letter or parcel mail on PLATFORM

B. If the INDICATOR WIRE goes beyond 5 pounds, change the "THROW-OVER POISE" to the 5-10 pound range (Separate sections of the scale CHART apply to each range.)

1. Read in white background from 0-5 pound range

2. Read in green background from 5-10 pound range

C. Determine the class of mail and zone desired

D. Visually follow across the CHART to the INDICATOR WIRE

1. If the INDICATOR WIRE falls on the line, the lower postage rate applies

2. When the INDICATOR WIRE exposes any portion of the line, the next higher rate applies

III. Completing job responsibilities

A. Remove letter or parcel from Scale

B. Replace cover on Scale

Student Participation

Give all the students the opportunity to determine the amount of postage needed for various samples of first, second, and third class mail while the remainder of the class observes

6148

Supplementary Material

Give duplicated sheets containing specific information about the Scales in the laboratory. The students are responsible for learning this information

Skill Building

Following the Rotation Plan and team assignment, the student is to spend the amount of time necessary to perform the following correctly.

1. Identify parts of the Scales

2. LEVEL Scales

3. Determine correct amount of postage for different classes of mail

3. Determine correct amount of postage for different classes of mail

6150

INSTRUCTIONAL UNITS

INTRODUCTION TO UNITS

The units that follow were prepared exclusively for the students who are a part of this program and may not be adaptable to other courses.

These units can be alternated during the year with jobs performed in the laboratory and may be used in any order with the exception of the units on Zip Code and Mail Classification. Zip Code should precede presentation of the Embossing Machine and Mail Classification should precede the Scales.

In this program the teacher and schedule <u>must</u> be flexible. In each situation the jobs done for organizations and businesses will vary. Consequently, the teacher may expand or reduce a unit and may find it desirable to change the order of presentation.

Because of the small number of students per class, the teacher will get to know the students well and may discover new needs. Therefore, any unit or units that would be beneficial or enriching to the students in the program at a given time may be added.

Current newspaper or periodical articles that identify with units in this course should be shared with the students. This will not only help them to be better informed, but also, will help them to realize that what they are studying is relevant.

An evaluation of each unit should follow any method the teacher feels would be most indictative of what the students have learned. This will probably vary with the different units.

6152

ZIP CODE

Objectives

To help the students understand the importance of the Zip Code and what it is

To teach the students the correct placement of the state and the Zip Code on the embossed plate

Time Two or three class periods, depending on the amount of drill given on locating Zip Codes

Presentation

Introduce Mr. Zip

Show transparency Mailing TM-1 (Zip stands for Zone Improvement Program which made its public appearance in mid-1963.)

Mention publicity and methods of advertising; show examples of advertising

Evaluate job of publicizing and advertising, since most Americans are now aware of the Zip Code

Discuss objectives for Zip Code

To increase the speed, accuracy and quality of all mail service

To hold down postal operating costs

Show film, "A Straight Line--The Story of the Zip Code."

This is a 25-minute color film which may be obtained from the Post Office Department.

Contact the local postmaster or write to Motion Picture Branch, Room 2507
U. S. Post Office Department
Washington, D. C. 20260

Discuss film

Give definition

Zip Code is a five-digit numeric address symbol that is quickly and easily identifiable by both postal employees and optical scanning equipment. (Use transparency Mailing TM-3)

0	6	9	04
AREA	STATE	CITY	LOCAL ZONE

The first digit identifies one of the 10 general geographic areas around the United States.

The second digit designates a state within the indicated geographic area . . . a portion of a densely populated state . . . or two sparsely populated states.

6158

The third digit pinpoints a large city or a postal sectional center.

The fourth and fifth digits indicate a specific delivery zone--part of a multicoded city or a smaller town.[1]

Explain use of National Zip Code Directory

Have several copies of the National Zip Code Directory in the classroom

Use the National Zip Code Directory and transparencies Mailing TM-8 and Mailing TM-9 to explain how to locate a Zip Code whether in the state list of post offices or in an appendix

Introduce city Zip Code directories

If the area is large enough to have a city Zip Code directory, obtain one from the post office and show the students how to locate a Zip Code in it (Several will be needed in the laboratory for use throughout the year.)

If there is no city directory for the area, obtain one from a city that is near-by so that the students will be familiar with one

Call the local post office to locate the Zip Codes of new streets that are not listed

Give the students a list of addresses and have them locate the correct Zip Code for each (Throughout the year probably some jobs done in the laboratory will require the students to locate Zip Codes.)

Show students how to emboss an address on a metal plate

Single space the address

Begin embossing on line two of the plate

Place the city, state, and Zip Code on the last line of the address

Show transparency with two-letter state abbreviations, Mailing TM-5

Use two-letter state abbreviations, typed in capitals with no period afterwards

Post a copy of the abbreviations by the Embossing Machine for reference (These abbreviations have been approved by the post office to be used with Zip Code. They may be read by the Optical Character Reader.)

Space two times after the state abbreviation and type the Zip Code

After the demonstration of the Embossing Machine, each student will use this information as he embosses plates.

6155

CLASSES OF MAIL, POSTAL SERVICES AND PRIVILEGES

Objectives

To help the students to identify the different classes of mail

To give the students practice in using postal services and privileges

To teach students the proper way of packaging and wrapping

To acquaint the students with the outlook for employment in post office occupations

Time Two or three class periods (will be longer if field trip is taken)

Presentation

Share with the students a brief historical development of postal services (Excellent information may be obtained from most encyclopedias, along with some good illustrations.)

The information and materials which follow were prepared by Mrs. Mavis C. Sparks, Specialist in Business and Office Education, University of Kentucky, in her unit, "Handling the Mail," Office Practices, January, 1968, and is used with her permission.

(Show transparencies while presenting the material prepared by Mrs. Sparks.)

Types of postal services

a. Domestic mail
   - -- Mail within, among, and between the U. S. and its territories and possessions; Army, Air Force and Navy post offices; and the United Nations
   - -- Includes first class and airmail, air parcel post, second class, third class, and parcel post
   - -- Weight limit, 70 pounds
   - -- Minimum size applicable to all classes, 3 by 4½ inches
   - -- Sending facilitated by zip coding (see "Mailing Transparency Masters" Mailing TM-1 and -3
b. Special services
   - -- Protection and individual treatment of pieces of mailing granted special consideration by payment of extra postage
   - -- Include special delivery, special handling, registered mail, certified mail, collect on delivery, and insured mail
c. Foreign mail
   - -- Mail outside the U. S. and its territories and possessions
   - -- Rates on surface mail and airmail to Canada and Mexico same as for domestic mail within U. S.
   - -- Other rates and weights were revised January 7, 1968
d. Other services
   - -- Mailing supplies sold
   - -- Tracing mail
   - -- Recalling mail

6156

Classes of domestic mail

a. First-class mail (See "Mailing Transparency Master" No. 10.)
   -- Includes
      1) Handwritten or typed letters and photocopies or carbon copies
      2) Bills, checks, punched cards, forms, etc., in partly written form
      3) Typewritten reports and documents
      4) Matter sealed against inspection
      5) Postal cards and post cards (single and double)
      6) Business reply cards and envelopes
      7) Airmail up to 8 oz. (sealed and unsealed)
   -- Will be forwarded or returned at no extra charge
   -- See "Special services" section for service applicable
   -- Rates applicable January 7, 1968 (See "Mailing Transparency Master" No. 10.)
   -- Permits sealing of:
      1) Parcels and envelopes wider than five inches or longer than 11½ inches
      2) Merchandise, books, or catalogs in envelopes smaller than 5 by 11½ inches (if contents are indicated on the outside)
      3) Require additional postage for forwarding
b. Second-class mail
   -- Applies to newspapers and periodicals
   -- Is granted to publishers and news agencies by application, payment of required fees, and compliance with regulations
   -- Rates
      1) Lower than third class and parcel post
      2) Transient rate charged when necessary to forward out of town
      3) Rates applicable January 7, 1968 (See "Mailing Transparency Master" No. 11.)
c. Third-class mail (See "Mailing Transparency Master" No. 12.)
   -- Includes
      1) Circulars and advertisements
      2) Unsealed greeting cards without written-in messages
      3) Books and catalogs having 24 or more pages
      4) Hotel keys and identification devices mailed without cover
      5) Other matter that cannot be classified as first or second class mail that weighs up to 16 oz.
d. Fourth-class mail (parcel post)
   -- Used for sending merchandise, books, printed matter, and all other mailable matter not first, second, or third class that weighs 16 oz. or over
   -- Limits weight and size according to delivery zone
   -- May be sent sealed or unsealed (sealing implies consent to postal inspection)
   -- Requires additional postage to forward; if undeliverable, may be returned to sender for postage due
   -- Rates determined by weight and distance transported; zones and rates applicable January 7, 1968. (See "Mailing Transparency Master" No. 14.)
e. Mixed classes of mail or combination mailing
   -- The practice of sending two classes of mail together as a single mailing so that they will arrive at the same time
   -- Postage paid on the two classes at their respective rates; sending by the lower class method
   -- "First-Class Mail Enclosed" must be typed, written, or stamped below the postage and above the address.
      "Mailing Transparency Master" No. 15.

6157

Special mailing privileges

a. Controlled circulation
   -- Applies to publications of 24 or more pages, circulated free or mainly free
   -- May not be forwarded, but can be returned to sender when so requested and address is known
   -- Rates
b. Official mail
   -- Allows government offices and personnel to send official mail without placing postage on envelopes or packages
   -- Charges estimated periodically and the Post Office Department reimbursed in a lump sum
   -- Requires stamps for special services, such as special delivery and airmail
c. Free mail
   -- Mail sent without postage by the general public
   -- Includes
      1) Matter for copyright
      2) Census mail, immigration and naturalization service mail, and absentee ballot envelopes from members of the Armed Forces
d. Franked mail
   -- Requires a real or facsimile signature of the sender in place of the stamp and the words PUBLIC DOCUMENT--FREE on the address side
   -- Used by the Vice President, members and members-elect of Congress, Resident Commissioners, and the Secretary of the Senate
   -- Privileges cease shortly after expiration of term of office
e. Penalty mail
   -- Used for official government correspondence
   -- Name comes from the note in stamp position: Penalty for Private Use to Avoid Payment of Postage $300
f. Mail for the blind
   -- Some free; other at nominal rates

Special mailing services (See "Mailing Transparency Master" No. 16.)

a. Special handling
   -- Applies only to parcel post
   -- Provides the most careful handling and transportation available
   -- Does not provide special delivery to the addressee
   -- Fee, in addition to regular postage, varies according to weight; no extra charge for forwarding
b. Special delivery
   -- Gives first-class mail promptness plus immediate delivery from the post office to the addressee
   -- Applies to all classes of mail
   -- Requires repayment of full fee if necessary to forward, unless request is made at time of mailing
c. Registered mail
   -- Applies to all classes
   -- Requires tight sealing by a method other than transparent tape
   -- Provides reimbursement for the full value of the article up to $10,000 if no commercial or other insurance is carried
   -- Moves from post office to post office in a locked pouch and is checked and accounted for at each post office and at delivery

61580

d. Insured mail
   -- Applies to third and fourth class mail
   -- Reimburses up to $200 if article is lost or stolen
e. Certified mail
   -- Provides the sender with a receipt by which a piece of mail may be traced
   -- May provide restricted delivery and return receipts
      1) Assures delivery to addressee only when mail is registered, certified, or insured for more than $10
      2) Gives legal evidence that the addressee actually received the piece of mail
   -- Gives the letter an appearance of importance and urgency
   -- Provides evidence of mailing
f. Collect on delivery (C.O.D.)
   -- Obtained by paying a fee plus the regular postage
   -- Rate varies with amount to be collected, weight of package, and distance
   -- Maximum amount collectible on one package--$200
   -- Available only on bona fide order or agreements made between the addressee and the mailer
g. Certificate of mailing
   -- Gives proof that the mail was put in the post office

Other services

a. Mailing supplies sold
   -- Stamps
      1) Available in sheet, coil, or booklet form
      2) Can be exchanged at full value when incorrect denomination is purchased or when damaged
   -- Precancelled stamps and envelopes
      1) Save cancelling time at the post office
      2) Can be used only by persons and companies who have been given a permit
      3) Can be used only at post office where purchased
   -- Stamped envelopes and cards
      1) May be purchased individually or in quantity lots
      2) May include return request and return address when ordered in quantity lots
      3) Postal cards available in single or double form (airmail postal cards, single form only)
      4) Exchange on unserviceable and spoiled envelopes and cards given in stamps, stamped envelopes, or postal cards (not cash)
b. Tracing mail
   -- Requires a written request to the post office
   -- Very difficult to trace mail that is not insured, registered, or certified
c. Recalling mail
   -- Requires filing a Senders' Application for Withdrawal of Mail and paying for all expenses incurred: telegrams, phone calls, return postage, etc.
   -- Will notify sender if mail has already been delivered, but will not inform addressee of recall request

Packaging and wrapping (See "Mailing Transparency Masters" Nos. 24 through 27.)

a. Use a container strong enough to retain and protect the contents during the normal course of mailing.
   -- For breakable items: boxes or cartons of fiberboard, kraftboard, chipboard (for small items), fiber mailing tubes with metal ends, metal, and wood
   -- For unbreakable goods not likely to be damaged by the weight of other mail: heavy wrapping paper, burlap or similar cloth
b. Use cushioning materials to protect the items from outside impact and from damaging one another.
   -- Always keep the container full unless the package contains specially designed padding.
   -- Use cellulose materials, cotton, clothing, shredded paper, or tissue paper for packing lighter items.
   -- Cushion heavy articles with excelsior, flexible corrugated fiberboard, or felt.
   -- Do not pack heavy and lightweight items in the same compartment.
   -- Pack heavy items so they will remain in a fixed position.
   -- Cushion fragile articles individually.
c. Use outside wrapping paper at least equal in quality and strength to a grocery bag.
   -- May omit outside paper wrappers if the box used constitutes an adequate shipping container.
   -- Do not use thin paper bags of two or more thicknesses of thin wrapping paper.
d. Fasten or close with strong twine or rope, tape, staples, or glue.
   -- Tape should be durable enough to withstand 60 pounds minimum pressure or should be the reinforced type.
   -- Staples may need to be reinforced by tape, twine, or glue.
   -- Glue should cover at least 50 percent of the area of contact when it is used and should hold firmly.
e. Mark or label packages appropriately.
   -- Mark <u>Fragile</u> when containing articles of delicate nature, such as glass, chinaware, electrical appliances, jewelry, musical instruments and radios.
   -- Mark <u>Perishable</u> when containing products which decay quickly, such as fresh meats, fresh fruits, and vegetables.
   -- Use <u>Rush</u> or <u>Do Not Delay</u> special delivery and special handling packages only.
   -- Use <u>Do Not Blend</u> or <u>Do Not Fold or Crush</u> only when content is fully protected by stiffening material.
   -- Cover or completely mark out old markings or labels when reusing a carton for mailing.
f. Weighing and determining amount of postage (Se "Mailing Transparency Master" No. 28.)
   -- Read postage scales accurately.
   -- Apply appropriate rate and zone chart for class of mail involved.

Supplementary Suggestions

Show films, If the Mail Stopped (28 minutes) and River of Mail (10 minutes), in color, free. Contact your local postmaster or write to
Motion Picture Branch, Room 2507
United States Post Office Department
Washington, D. C. 20260

Have students package and wrap parcels in the laboratory and determine correct amount of postage for each. (Near the holidays perhaps the students could wrap parcels for mailing for teachers and others.)

Take the students on a field trip to the post office. If in an area where there are branch post offices, be sure to go to the main post office on the field trip. It will prove to be more interesting because of the size and volume of mail and the amount and size of machinery.

Discuss jobs related to the post office. Have a copy of the Occupational Outlook Handbook in the classroom. Show the students the section on post office occupations and share with them briefly some of the information. Keep the book where the students may refer to it when they desire. (Occupational Outlook Handbook may be ordered from the Government Printing Office, Washington, D.C. 20402. Separate reprints may be ordered for post office occupations.)

BULK RATE MAIL

Objectives

To help the students to understand the meaning of bulk rate mail

To teach the students to sort, bundle, and label bulk rate mail properly

Time One class period (Preferably this would be the day before the students would work on an actual job in the laboratory using this information.)

Presentation

Explain that the bulk rate is applicable to mailings of separately addressed identical pieces in quantities of at least 50 pounds or 200 pieces and that each piece may weigh up to but not including 16 ounces and all pieces in the mailing must be identical in size, weight, and number of enclosures.*

A $30 bulk rate mailing fee is charged for each calendar year.

A permit may be obtained at the post office.

Prepaid postage must be by one of the following:

Permit imprints
Meter stamps
Precanceled stamps
(Show example of each and identify.)

Sort, bundle, and label

Explain the procedure according to the information attached (How to Prepare Second and Third Class Mailings, POD Publication 21, April, 1969, can be obtained from The Louisville Post Office.)

Select suitable envelopes that the students addressed earlier in the year while using the Addresser-Printer (These envelopes may be used to demonstrate the correct procedure.)

Have other materials for the students to use while learning to prepare bulk rate mail

Obtain, if possible, several jobs from organizations and businesses that send out a bulk rate mailing periodically (This will provide use of their acquired knowledge about bulk rate mail throughout the year. Possible sources for jobs are a PTA that sends out newsletters or a civic organization that sends out a bulletin or newsletter.)

---

*United States Post Office Information Sheets concerning Bulk Rate Mail follow the unit.

Explain use of form 3602

This form must be prepared in duplicate and presented with the mailing.

A copy should be obtained from the post office and the students shown how it would be filled out according to the envelopes that they have been working with while learning to sort, bundle, and label.

Give information concerning postage of bulk rate mail

Postage must be paid prior to or at the time of the mailing.

Deposits may be made in advance to cover mailings.

Details concerning the specifics of obtaining a permit and the specifications required by the holder of the permit have been omitted. The supervisor or an individual in a higher position would probably be the one to purchase the permit and make sure that the mail met the necessary specifications.[1] However, employees in the mail room would probably have the responsibility of sorting, bundling, and labeling the bulk rate mail.

---

[1]United States Post Office Department, "Mailing Permits"--Excerpts from Chapter I, Postal Manual, POD Publication 13 (Washington, D. C. 20260: United States Postal Department, July, 1966.)

UNITED STATE POST OFFICE
Louisville, Kentucky 40201

The bulk rate is applicable to mailings of separately addressed identical pieces in quantities of at least 50 pounds or 200 pieces. Each piece may weigh up to but not including 16 ounces and all pieces in the mailing must be identical in size, weight, and number of enclosures.

A bulk mailing fee of $30 is required for each calendar year.

The rate for circulars, miscellaneous printed matter, and merchandise is 22¢ per pound with a minimum charge of 3.8¢ per piece (2.76 ounces or less). The rate for books and catalogs having 24 or more bound pages (with at least 22 printed) is 16¢ per pound, with a minimum of 3.8¢ per piece (3.8 ounces or less). If your total bulk mailings at all post offices exceed 250,000 pieces in the calendar year (last six months of 1969), the minimum charge per piece is 4¢ (2.90 ounces or less for circs., etc., 4.00 ounces or less for books, etc.).

Postage must be prepaid by one of the following methods:

1. Permit Imprints ($15 application fee required)
2. Meter Stamps ($15 permit may be needed)
3. Precanceled Stamps

A permit to use any of these methods may be obtained in the office of Postal Information, Room 105, Main Post Office.

PERMIT IMPRINTS

Permit Imprints may be made by printing press, handstamp, lithography, mimeograph, multigraph, addressograph, or similar device. They may not be typewritten or handdrawn. The imprint must be legible and must be of a color that contrasts sufficiently with the paper to make the imprint readable.

Bulk Rate
U. S. Postage
PAID
Louisville, Ky.
Permit No. 0

OR

Bulk Rate
U. S. Postage
PAID
Permit No. 0

Postage in full on the entire quantity must be paid prior to or at the time or mailing. Advance deposits to cover a number of mailings may be made at Window No. 18 in the main office lobby, (hours 8:00 AM to 4:30 PM, Monday thru Friday), or check may be mailed to "Postmaster, Louisville, Kentucky 40201". If deposits are made by check a bank guarantee of the account will be required.

The mail must be presented at the Weighing Section, Door No. 1, rear platform, main post office (hours 8:30 AM to 5:00 PM, Saturday, 8:00 AM to noon). Each mailing must be accompanied with a statement, Form 3602, prepared by typewriter, ink, or indelible pencil, bearing hand-written signature in ink or indelible pencil. One receipt may be obtained by presenting a duplicate copy.

6165

Mail bearing permit imprints must not be sidtributed otherwise than through the mail. It must not be used as enclosures.

WITH METER STAMPS

When postage is paid with meter stamps the words "Bulk Rate" or the abbreviation "Blk. Rt." Must be included. If meter will not print correct amount (such as 3.8¢) then the next lower value which can be recorded by meter (such as 3¢) should be printed together with an inscription showing additional amount paid, as for example, "Add'l .8¢ Pd." The additional amount due under this arrangement must be paid by advance deposit, as is done with permit imprint mail. This means that an imprint type permit (a permit to mail without stamps affixed) must be obtained. In these instances a separate statement of mailing (Form 3602) must be filed (in addition to Form 3602-PC) showing amount of additional postage paid.

When meter stamps are placed directly on the mail, omit the date. If tapes are used the month and year must be shown.

Metered mail partly paid by advance deposit must be mailed at the Weighing Section, Main Post Office. If fully paid with meter stamps it may be mailed at any branch or station of the Louisville post office; each mailing accompanied by a statement of mailing on Form 3602-PC.

WITH PRECANCELED STAMPS

When postage is paid by means of precanceled stamps the identifying words "Bulk Rate" must be printedor handstamped in the upper right corner of the address portion. The stamp should be placed adjacent to this marking, or precanceled stamps may be used to hold together the edges of matter mailed without envelopes.

The mail may be presented at the Weighing Section, Main Post Office, or at any branch or station of the Louisville post office. Each mailing must be accompanied by a statement of mailing on Form 3602-PC.

NONPROFIT ORGANIZATIONS

Authorized nonprofit religious, educational, scientific, philanthropic, agricultural, labor, veteran and fraternal organizations or associations may mail at the special minimum rate 1.6¢

Application (Form 3624) to mail as a nonprofit organization must be approved by the postmaster. Nonprofit organizations mailing at special bulk rates must print the words "Nonprofit Organization" or "Nonprofit Org." as part of or adjacent to the postage.

UNITED STATES POST OFFICE
LOUISVILLE, KENTUCKY 40201

HOW TO PREPARE SECOND-CLASS & THIRD-CLASS BULK RATE MAIL

1. ZIP Code each piece.

2. Face all addresses same way.

EACH PIECE MUST CARRY ZIP CODE

3. Sort by ZIP Codes.

4. When there are 10 or more pieces (6 or more for second-class) as described below they must be tied together with twine both lengthwise and crosswise.

BUNDLES

3rd CLASS (10 or More Pieces)
2nd CLASS (6 or More Pieces)

5 DIGIT | CITY | SCF (Same First 3 Digits) | STATE | MIXED STATES

BUNDLE AS FOLLOWS:

LABEL
Do not label

a. Pieces with same five-digit ZIP Code.

b. Pieces with same first three digits of ZIP Code (multi ZIP Coded cities) — "Mixed City" (Leave top address exposed)

Tuck ends in to secure

c. Pieces with same first three digits of ZIP Code (post offices in same Sectional Center Facility). — "Mixed SCF" (Leave top address exposed)

d. Pieces for same State. — State "(Name)" (Cover address)

e. Pieces remaining. — "Mixed States" (Cover address)

5. When there is a sufficient volume (enough to fill a No. 2 sack 1/3 full) the mail must be sacked and labeled. The weight per sack must not exceed 80 pounds.

SACKS (⅓ SACK OR MORE)

Approx. 1 ft. of mail

5 DIGIT | CITY | SCF | STATE | MIXED STATES

Sample Sack Labels →	Danville KY 40422 Circs Jay Co Louisville KY.	Chicago IL 606 Circs Jay Co Louisville KY	SCF Dayton OH 453 Circs Jay Co Louisville KY	Nashville TN TERM 370 TN Circs Jay Co Louisville KY	DIS Louisville KY 400 Mixed States Circs Jay Co Louisville KY

Letter size mail is labeled "Circs" (Circulars) - Other mail "Ord P" (Ordinary Papers). Sack labels must show the name of the mailer.

Sectional Center Facilities and Multi-Coded cities are listed in the National ZIP Code Directory. Separate lists are available upon request. Further information on any of the above matter may be obtained from the Weighing [illegible] Main Post Office - Phone 582-5526.

Postmaster

UNITED PARCEL SERVICE

Objectives

To develop an awareness of a firm which specializes in the field of small package delivery

To develop an understanding of how UPS operates

To provide information about UPS employment opportunities

Time Three class periods

Presentation

Introduction

Define parcel

Show the class a picture of a parcelman with his vehicle (This may be obtained from the local United Parcel Service office, along with the brochure, "The ABC's of UPS Service.")

Inform students that this company delivers over one million packages a day and ask them to identify this company

Give brief history

1907--a messenger service operating from a basement office with six boys and six bikes was started in Seattle by James E. Casey.

1919--became known as United Parcel Service: United to signify consolidation--Parcel to identify its medium--and Service as a pledge.[1]

Presently offers service to a large portion of the United States

Show the film, "The Parcelman," a 27 minute color film which gives a good overview of the work and organization of UPS (This film may be obtained from the local UPS representative.)

Discuss film

Explain how UPS operates

Note similarities to United States Post Office

Discuss differences from the post office

---

[1]Pitney-Bowes UPS Parcel Register System, p. 1.

6168

Show advantages of UPS

Rates competitive with parcel post rates

Parcelman automatically calls daily to pick up parcels.

Deliveries are made directly to customers.

Handles C.O.D.--cash or check may be requested

Parcelman makes up to three attempts to deliver a package on consecutive delivery days, if necessary, with no extra charge for this service.

Each parcel automatically covered up to $100 for loss or damage at no additional charge with additional coverage for a fee

Shipper may request delivery information.

Compare methods of record-keeping for the shipper (See Transparency UPS-Pickup Record 26411 and 23568.)

By hand

List each individual parcel in the pick-up book including the name, address, and Zip Code of the recipient plus the weight of the parcel

Count the number of packages shipped

Handstamp each parcel

By Parcel Register System

Show the students pictures of UPS Scales and UPS Meters made by Pitney-Bowes (Brochures and pictures of this equipment may be obtained from the local Pitney-Bowes office. Other companies also manufacture UPS Parcel Register Systems. The sale of this equipment is dependent upon the fact that the prospects use the service of another company.)

Make clear that there is no need to list each parcel unless C.O.D. or extra valuation shipment, then use only identifying number

Explain that the machine counts each package automatically and prints a tape for each parcel that shows the shipper number, date, and shipping cost and that there is no need to handstamp

Show students a sample package which has previously been received through UPS and let them examine the tape and the information printed on it

Supplementary Suggestions

Invite a representative from the local United Parcel Service office to come to class and provide answers to questions the students may have about UPS and also, have him explain job opportunities with UPS, qualifications needed, and company benefits

If there is an UPS Operating Center in the area, take the students on a field trip to see it in operation

CIVIL SERVICE

Objectives

To develop an awareness of opportunities for employment by the federal government

To provide an understanding of the procedure for obtaining information concerning the Civil Service examinations

Time Three class periods

Presentation

Introduction to Civil Service

Includes most jobs in state and federal government agencies in the executive branch who are appointed rather than elected

Largest single employer in the United States

Usually covers only those workers included in the Merit System

Selects the best qualified person as demonstrated on a competitive examination

Guarantees an individual that he will keep his job on the basis of good performance instead of allegiance to a political party

Workers in all parts of the United States, territories, possessions, and some other lands hired and assigned by Interagency Board of U. S. Civil Service Examiners

The address and telephone number of the Interagency Board of the Civil Service Commission is listed in the telephone directory under United States Government--Civil Service Commission

Less than 10 employees out of every 100 live in Washington, D. C.

Examinations

Required of applicants

Announced for specific types of positions where there is a need to fill these positions

Sources of information about examinations and announcements

Post Office

Federal Job Information Center

State Employment Services Offices

SF13 6171

Applications available from Interagency Board office in response to call or written request

Notice sent to the applicant by Interagency Board giving the time, place, and date of the examination, some sample questions, and a longer application than the first one--(for those positions requiring a written test)

After first application has been received and processed, examinations according to types of jobs may be written, oral, or a performance test, such as operating a machine, typing, or stenography. (Some examinations do not require a written or performance test. Applicants may be required to show experience or training in a particular field of work or potential to learn or perform in a skill. Some examinations may require only high school graduation in order to qualify.)

Information concerning the jobs, experience or tests required, and how to apply given in examination announcements (Before applying, applicants should read the announcement carefully.)

Examination scores

All applicants notified of their scores by mail

Passing scores

Names of persons who score 70 or better placed on a list of eligibles in order of score, those with highest scores being considered first

Extra points given to veterans; disabled veterans, or their wives; widows of veterans; and dependent mothers of deceased or disabled veterans

Even though one passes, he may reapply at any time while the examination is still open if improvement of score is desired.

One who fails may retake the examination if applications are still being received.

Additional requirements

Minimum age 18, usually, but for most jobs 16 if high school graduate

High school graduate preferred

American citizen

Good physical condition

Must physically be able to perform duties of position

World's largest employer of handicapped people

1718 6172

Benefits

No discrimination against sex, race, or religion

Promotion and transfer privileges

Vacation (earned at the rate of 13 days a year for first 3 years--20 days for next 12 years, and after 15 years 26 days a year)

Paid holidays

Sick leave allowance which can be accumulated without limit until needed (earned at the rate of 13 days a year)

Retirement plan which may be as early as 55 with 30 years of service or as late as 70

Compensation

According to duties and responsibilities under several different pay plans

Extra pay for overtime work

Allowances if the employee must travel or buy uniforms for his job

Supplementary Suggestions

Have students list types of jobs under Civil Service with which they are familiar; add to list as the course progresses

Arrange a display of sample announcements of examinations for several positions, sample applications, and sample examination questions; let the students examine them and ask questions (These samples may be obtained from the nearest Interagency Board office and it is possible to be placed on their mailing list to receive announcements in the future and keep students up-to-date on examinations being given.)

Have books about Civil Service available for the students to examine (Some recommended ones are Intensive Clerical and Civil Service Training by Robert Fisher, South-Western Publishing Company, Cincinnati, 1968; and those printed by the Civil Service Commission. A price list may be obtained from the Superintendent of Documents, U.S. Government Printing Office, Washington, D. C. 20402.)

Provide each student with the Civil Service Commission brochure, "Working for the U. S. A." (These may be ordered from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402.)

Invite a representative of the Interagency Board to come and speak with the classes (This will make federal employment more personal to them.) Have the speaker from the Interagency include information about student summer employment in his presentation; allow time for the students to ask questions

Share with students current periodical or newspaper articles concerning the Civil Service Commission or Interagency Board

AUTOMATION

Objectives

To develop a basic awareness that automation exists

To help the students understand that our daily lives are influenced by automated equipment

Introduction of unit

Films

This Is Automation is a thirty-minute color film produced by General Electric in which both simple and complex examples of automation range from the manufacture of cookies to the manufacture of cars.

The Information Machine is a ten-minute color film suitable for high school students and gives an amusing account of the development of the computer beginning with primitive man.

Bulletin board

Mount actual punched cards, punched tapes, program sheets, pictures of computers, recent periodical and newspaper articles about automation, and current articles about opportunities for employment in automation

Request the students to bring any current articles on automation that they encounter and add them to the bulletin board

Encourage students to bring items which would be evidence of automation in the community and add them to the bulletin board. (Examples of items would be punched clothing tags, utility bill stubs, receipts with magnetic ink numbers, and other items.)

Magnetic ink characters and numbers used to code deposit slips (Show class actual examples of a check and a deposit slip with magnetic ink characters and numbers)

Processing of loans

Doctors

Automatic answering service

Recording heartbeats

Diagnosis of disease

Medical research

Education

Attendance records

Class scheduling (An explanation may be given of how this and the previous item are done by computer in the Jefferson County School System.)

Budget maintenance

Test scoring

Grade cards

Government

National

Election results

Income tax records

Inventories of defense supplies (Students may add to this list.)

State

State taxes

Processing of car licenses and operating licenses

Local

Tax offices

Post office

City records

Real estate agents

Customer description of house he desires to purchase--price, size, style, basement, and other details

Information matched by computer with houses on the present market having this description

Service companies--billing and address changes

Telephone company

Gas company

Water company

Electric company

6177 STIB

Weather forecaster

Predicting weather conditions

Charting hurricanes

Brochures--Two brochures containing basic information on the computer and data processing are available. Both are approximately twenty pages in length, have clever illustrations, and are written on about a ninth grade level.

"Electronic Data Processing Written for the Layman--What Is Data Processing?" published by National Cash Register

"You and the Computer," a student guide, published by General Electric

Require students to read the brochures

Discuss content of the brochure in class

Conclusion of Unit

Take students to the school office and make arrangements for the secretary to explain in detail how the teletype machine is used to record on tape their attendance records

Evaluate this unit by having the students write several paragraphs giving specific examples of automation as it relates to daily living.

6178

YOU AND YOUR JOB

General Objectives

To teach methods of finding a job

To teach proper methods of getting the desired job

To teach ways to keep a job

Teacher Information

The book, You and Your Job[1], should be furnished each student. (Funds for these books should be available from service charges collected on jobs done in the laboratory.) The presentation that follows will be suggestions to use with the chapters in the book.

The teacher should keep in mind that:

a. New ways of making things, new things to make, and new patterns of living are continuously causing changes in the kinds of jobs available.
b. An individual is likely to engage in more than one occupation (perhaps several) during his lifetime.
c. Experience carries much less weight now than it did 20 years ago, and education is increasingly becoming more important.
d. An individual may need to be prepared for more than one job.
e. Consideration must be given to changing ideas of the student if his final choice is to be worthwhile.
f. Interest is as decisive as ability in determining career directions and satisfaction.
g. There are many roads to a occupational goal.
h. The student must make his own choice and realize that the decision is his.
i. His choice now may be only tentative. His experiences at this time may not be adequate for him to make any job choice at all. If the student does make a selection at this time, future events may create new interests.[2]

Additional Materials and Suggestions for Use with Chapter 1, You and Your Job

Study want ads

Use transparencies, Job Finding TM 3, 4 and 5, and explain the "employment wanted" ad and the kinds of "help wanted" ads shown on the transparencies

Give each student an ad section from the local newspaper and have the students locate an ad of each kind discussed (These ad sections may be saved for later use.)

Employment offices

Give the students the address of the nearest government employment office

Invite a representative of a local commercial employment agency to visit the class (He will be able to share current employment information about the local area and explain the workings of his company. He may challenge the students, and perhaps will encourage them in their endeavors.)

Additional Material and Suggestions for Use with Chapter 2, You and Your Job

Explain the importance of working and the classification of occupations and their interdependence

Distribute copies of excerpt from the unit, "Career in Business and Office Occupations" by Mrs. Mavis C. Sparks, September, 1967 (See Appendix)

If possible, have the following books and brochures in the classroom (Good material for the students to inspect)

The Encyclopedia of Careers & Vocational Guidance
Volume I Planning Your Careers
Volume II Careers & Occupations
William E. Hopke, Editor-in-Chief
Doubleday & Company, Inc., Garden City, N.Y., 1967
in cooperation with J. G. Ferguson Publishing Company, Chicago

Occupational Outlook Handbook, U.S. Department of Labor, Bureau of Labor Statistics, Government Printing Office, Washington, D. C., 1968-1969

Free brochures from General Motors, Public Relations Staff, Detroit, Michigan 48202

Can I Make the Production Team?

Can I Be an Office Worker?

In Planning Your Future, Look First at the Retail Automobile Business

Survey books in the school library that deal with careers, check these books out of the library, and have a display in the classroom

The importance of working[1]

a. By 1975 the U.S. civilian work force will be about 95 million persons working in over 24,000 different occupations.
b. The basic reasons why people must work include providing the necessities--food, clothing, and shelter. Beyond this, people work to provide themselves and their families with the finer things of life.
c. An individual may also work for other reasons unique to himself.

The classification of occupations and their interdependence

a. The major occupational groups into which jobs may be classified[2]
   -- Semiskilled workers (13 million in 1964). Engage in assembling goods in factories; driving trucks, buses, cabs; and operating machinery.
   -- Clerical workers (11 million in 1964). Operate computers and office machines, keep records, and type.
   -- Skilled workers (9 million in 1964). Include carpenters, tool and die makers, instrument makers, all-around machinists, electricians and typesetters.
   -- Professional and technical (8½ million). Include such highly trained personnel as teachers, engineers, physicians, lawyers, and clergymen.
   -- Proprietors and managers (about 7½ million). People who are in business for themselves or manage the operations of commercial, industrial, or public employers.
   -- Service workers. Men and women who maintain law and order, assist profesional nurses in hospitals, give haircuts and beauty treatments, serve food and beverages, and see to it that the public is satisfactorily accommodated in hotels, restaurants, airplanes, ships, and trains.
   -- Sales workers (4½ million). Found in retail stores, wholesale firms, insurance companies, real-estate agencies, and selling wares door to door.
   -- Unskilled workers (3½ million, excluding those in farming and mining). Those who move, life, and carry materials and tools.
   -- Private household workers (5.3 million). Maids, governesses, laundresses, caretakers, butlers.
   -- Farmers and farm managers (2.3 million). Have the help of over 2 million farm laborers and foremen.
b. The places where work is done[3] (Any skill may be sought by a wide variety of employers.)
   -- Manufacturing. New products for industrial and consumer markets and the rapid growth of the defense-space market have spearheaded these industries to employ 17 million, the largest group.
   -- Trade. This major industry group employed 12 million in 1964 in wholesale and retail outlets in large and small cities due to the increasing needs of our urban society.
   -- Government. Employment in government work has grown faster than any other industry. The increases have been greatest in education, health and hospitals, sanitation, and police services. State and local governments account for three-fourths of the employees.

---

[1]From Mavis C. Sparks unit "Careers in Business and Office Occupations," December, 1967.

[2]Occupational Outlook Handbook (Washington, D.C.: U.S. Government Printing Office, 1966), pp. 10-11.

[3]Ibid., p. 11.

-- Service and miscellaneous. There have been rapid employment increases in these industries due to rapidly growing needs for maintenance and repairs, domestic service, laundry, hotel service, and other services.
-- Agriculture--Employment has decreased in this industry, which once employed more than half all workers, due to decrease in the number of farms; mechanization; and improved fertilizers, feeds, and pesticides.
-- Transportation and public utilities. A tremendous jump in air and bus travel has offset the declines in the railroad industry. Employment in this industry has dropped 5 percent since 1947.
-- Construction. This industry has an employment increase of 57 percent for the period 1947 to 1964. The nation's growing need for homes, offices, stores, highways, bridges, dams, and other physical facilities brought this about.
-- Finance, insurance, and real estate. Employs 2.9 million.
-- Mining. Employment has fallen off because of labor-saving technological changes and a shift to sources of power other than coal.

Opportunities for work in business[4]

a. Clerical and sales occupations. Those concerned with preparing, transcribing, transferring, systematizing, and preserving written communications and records; collecting accounts; distributing information; and influencing customers in favor of a commodity or service.
   -- Stenography, typing, filing, and related occupations. Concerned with making, classifying, and filing records, including written communications.
      1) Secretaries. Cary out minor administrative and general office duties, in addition to taking and transcribing dictation.
      2) Stenographers. Take shorthand or speedwriting notes by hand or machine and transcribe them.
      3) Typists. Record data by means of a typewriter.
      4) Correspondence clerks. Compose correspondence and related items to obtain or give information.
      5) Personnel clerks. Assist job seekers in filling out application forms; supply information regarding company hiring policies or requirements; investigate applicant's work history to determine suitability for employment; and compile and keep current employment records, such as recruitment, training, promotion, attendance, retirement, and discharge of employees.
      6) File clerks. Classify, sort, and file correspondence, records, and other data.
      7) Duplicating machine operators. Make copies of data by means of machines, such as the Dual-Lith, Multilith, Masterlith, Mimeograph, Dupligraph, Multigraph, Compotype, Graphotype, and Xerox. May duplicate braille printed pages on chemically treated plastic paper.
      8) Miscellaneous office machine operators and stenography, typing, filing, and related occupations.

---

[4] Dictionary of Occupational Titles, Volume II (Washington, D.C.: U.S. Government Printing Office, 1965), pp. 5-8, 46-49, 51-65.

-- Computing and account-recording occupations. Concerned with systematizing information about transactions and activities into accounts and quantitative records, and paying and receiving money.

1) Bookkeepers. Compute, classify, and record numerical data to keep sets of financial records complete. Does not include machine operators.
2) Cashiers. Receive and disburse money in establishments other than banks, using adding machines, cash registers, and change makers.
3) Tellers. Disburse and receive money in a bank and record transactions.
4) Automatic data-processing-equipment operators. Those concerned with electronic and electromechanical machines that record, store, process, and transcribe data from punchcards, paper tape, magnetic tape, or other sources; solve mathematical, engineering, or technical problems; keep records; or supply information.
5) Billing machine operators. Operate billing machines with or without computing devices to keep accounts and prepare statements, bills, and invoices.
6) Bookkeeping machine operators. Operate bookkeeping machines to copy and post data, make computations, and/or compile records of transactions.
7) Computing-machine operators. Operate adding or calculating machines to perform arithmetic operations.
8) Account-recording-machine operators. Operate machines to keep quantitative records and accounts.
9) Computing and account-recording occupations, not elsewhere classified.

-- Material and production recording occupations. Concerned with receiving, storing, issuing, shipping, and accounting for stores of material or material in use. Includes assigning locations and space to items, verifying quantity, identification, condition, and value; the physical handling of items, including binning, picking, stacking, and counting; preparing or committing stocks for shipment; inventorying stock; replenishing depleted items; filling orders, issuing tools, equipment, or materials to workers.

1) Production clerks. Route parts for fabricating operations or repairs; schedule work and deliver parts to avoid over-production; compile records and reports on number and types of units produced; and schedule shipment of parts.
2) Shipping and receiving clerks. Assemble, pack, address, stamp, load, and ship merchandise or material; or receive, unpack, verify, and record incoming merchandise or materials.
3) Stock clerks and related occupations. Receive, store, ship, and issue supplies, materials, and equipment in a stockroom or warehouse environment. May take inventories, keep records, and requisition stock.
4) Weighers. Weigh materials or products for the purpose of keeping clerical records.
5) Other

-- Information and message distribution occupations. Concerned with distribution of information and messages by mail, telephone, telegraph, and in person.

1) Messengers, errand boys, and office boys and girls. Run errands; sort and deliver letters, packages, and messages; furnish workers with clerical supplies; and perform similar routine tasks in an office.
2) Mail clerks. Prepare incoming and outgoing mail for distribution. Time stamp, read, and sort incoming mail; and seal and stamp outgoing mail or packages.
3) Post office clerks. Sell postage stamps, postal cards, postal savings certificates, and U.S. Savings Bonds; write money orders; register and insure mail; compute mailing costs; sort outgoing mail; and record daily transactions.
4) Mail carriers. Sort mail and deliver it to private homes and business establishments along an established route.
5) Mail-preparing and mail-handling-machine operators. Operate machines to emboss names, addresses, and other matter on metal plates for use in addressing machines, and similar information on items, such as envelopes, accounting forms, and advertising literature; to address, fold, stuff, seal, and stamp mail; and to address envelopes.
6) Telephone operators. Operate the telephone switchboard to relay incoming and interoffice calls, make connections with outside lines for outgoing calls, establish connections between subscribers, supply information, and calculate long distance charges.
7) Telephone operators. Operate telegraph equipment to transmit and receive signals or messages. Transmit train-delay reports, train orders, etc.
8) Receptionists and information clerks. Answer the telephone and information requests from patrons and inquiries from company employees or from visitors coming into an establishment regarding such matters as activities carried on in an establishment; location of offices and employees within firm, other firms, hotels, stores, and places of interest; and transit service. Keep a record of call callers and nature of their business, make appointments and interview people to secure such information as hospital admittance data.
9) Other occupations in this category.

-- Miscellaneous clerical occupations. Concerned with public contact, such as examining and adjusting claims and records, collecting and tracing accounts, and quoting prices.

1) Collectors. Collect payments on installments or overdue accounts; trace addresses of customers changing residence without notification; and collect money from coin boxes.
2) Adjusters. Investigate and determine the validity of customers' claims or complaints concerning merchandise or service, and arrive at a settlement.
3) Hotel clerks, n.e.c. Register guests, rent rooms, check keys and valuables, distribute mail, and supply information.

4) Direct service clerks, n.e.c. Perform sales service work, involving personal contact with customer, such as furnishing prices on items of merchandise over the telephone; examining returned merchandise to determine if it is represented on sales slip, and crediting customer's account or authorizing cash refund; returning found articles to owners; storing and issuing merchandise to customer on demand.

5) Other miscellaneous occupations in this category.

-- Salesmen of services. Sell real estate, insurance securities, business and financial services, radio and television broadcasting services, hotel services, maintenance and repair services, utilities, and printing and advertising, etc.

-- Salesmen and salespersons of commodities. Sell horticulture and nursery products; agriculture products; foodstuffs, beverages, and tobacco; textiles, textile products, and apparel; leather and leather products; paper and paper products; chemicals and drug preparations; fuel and petroleum products; plastic products; rubber products; stone, clay, and glass products; metal and metal products; house-furnishings; hotel and restaurant equipment and supplies; industrial, construction, mining, and drilling equipment and supplies; farm and garden equipment and supplies, household appliance and electrical machinery, equipment, and supplies.

b. Professional, technical, and managerial occupations (those concerned with the theoretical or practical aspects of such fields of human endeavor as art, science, engineering, education, medicine, law, business relations, and administrative, managerial, and technical work. Most require substantial educational preparation at the university, junior college, or technical level.)

-- Occupations in administrative specializations. Concerned with specialized administrative and managerial functions which are common to many types of organizations. Demand a knowledge of a particular function rather than a knowledge of the operations of an organization. Includes occupations which involve the more routine nonclerical duties or a combination of clerical and administrative work.

1) Accountants and auditors. Examine, analyze, and interpret accounting records for the purpose of giving advice or preparing statements and installing or advising on systems of recording costs or other financial and budgetary data.

2) Budget and management analysis occupations. Study the policies, organizational structures, and administrative practices of such organizations as governmental units, industrial firms, and nonprofit groups; and review periodic budgets submitted by operations personnel. Prepare reports summarizing findings and recommending to line management changes in policy, organization, and administration. Consolidate the budget estimates of several organizational units and prepare a unitary budget itemizing such proposed expenditure as salaries and wages, overhead, and production costs, for consideration and action by upper echelon of management.

3) Purchasing management occupations. Negotiate and contract for the purchase of equipment, products, and supplies for industrial plants, utilities, governmental units, or similar establishments, and purchase merchandise for resale; determine quality to be purchased, costs, delivery dates, contract conditions, sources of supply, and taking inventories.

4) Sales and distribution management occupations. Manage sales and marketing for a manufacturer, retail or wholesale house, jobber, or other establishment. Do market research and analysis; establish and manage a sales organization; and evaluate sales statistics and reports.
5) Advertising management occupations. Influence public consumption or opinion, either as an employee of the organization served or as a member of an agency under contract; manage advertising programs and campaigns; and, in advertising agencies, manage customers' accounts.
6) Public relations management occupations. Promote or create good will for individuals, groups, or organizations by writing or selecting favorable publicity material and releasing it through various communications media, preparing and arranging for displays, making speeches, and performing related publicity efforts.
7) Personnel and training administration occupations. Formulate policies relating to the personnel administration of an organization and conduct programs of recruitment, selection, training, promotion, welfare, safety, compensation, recreation and separation of employees.
8) Inspectors and investigators, managerial and public service. Examine people, animals, plantlife, products, and establishments, in the capacity of city, county, Federal, or private inspector or investigator, for enforcement of health, safety, and other regulatory laws.

-- Other managers and officials.
1) Wholesale and retail trade managers and officials. Concerned with selling merchandise to retailers; to industrial, commercial, institutional or professional users; or to other wholesalers; or acting as agents in buying merchandise for or selling merchandise to such persons or companies.
2) Finance, insurance, and real estate managers and officials. Include managerial occupations concerned with banks and trust companies, credit agencies other than banks, investment companies, brokers and dealers in securities and commodity contracts, and security and commodity exchanges; all types of insurance, and insurance agents and brokers; owners, leasors, leasees, buyers, sellers, agents, and developers of real estate.
3) Service industry managers and officials. Found in hotels and other lodging places; establishments providing personal, business, repair, and amusement services; medical, legal, engineering, and other professional services; nonprofit membership organizations, and other miscellaneous service.
4) Others, agents and appraisers, etc.

-- Occupations in education. Include teaching of commercial subjects at the college, junior college, business school, vocational school, company training school, high school, and junior high school levels, and school administrative positions.

-- Occupations in writing. Opportunities in writing business and financial news for newspapers and magazines, textbooks and related material for schools and colleges, and writing for technical publications within and outside the company.

Clerical occupations predominately held by women[5]

a. With over nine-tenths women
   -- Receptionists
   -- Secretaries
   -- Stenographers
   -- Telephone operators
   -- Typists

Clerical occupations with over four-fifths or more men[6]

a. Agents
b. Baggagemen
c. Collectors, bill and account
d. Dispatchers and starters
e. Express messengers and railway mail clerks
f. Mail carriers
g. Messengers
h. Telegraph messengers

Job families

a. Definition. A group of related occupations having similarities in fundamental work activities; machines used; and experience, training, skills, and personal qualities required of the worker. Varying levels of ability may exist in the jobs which compose the family.
b. Business and office job families
   -- Stenography, typing, filing, and related occupations
   -- Computing and account-recording occupations
   -- Material and production recording occupations
   -- Information and message distribution occupations
   -- Sales
   -- Teaching commercial subjects
   -- Management positions

A STUDY OF_____WORK

(MY CHOSEN FIELD OF WORK)

Picture of Person Engaged in

Chosen Occupation

Job Description:

by

_____
Name

_____
Subject

_____
Teacher

_____
School

_____
Address

_____
Date

5189

WORK

A. Nature of the Work

-- Activities, duties, and responsibilities

-- Machines and tools used, and in what way

-- Special skills used

-- Unusual characteristics of duties

-- Expected changes in the nature of the work due to new machines, products, and processes

B. Place of the Position in the Administrative Structure
(An organization chart may be used here.)

-- Relation to other jobs

-- Relation to the organization as a whole

-- Related positions

C. Status in the World of Work and Employment Outlook

-- History of the occupation

-- Importance of the occupation

-- Importance and relation to society

-- Number of and future need for workers in the U.S., the state, the county

-- Turnover and places where demand for workers in this occupation is greatest

-- Typical place of employment

6190 fera

D. Personal Requirements for Doing the Work

-- Mental (verbal comprehension, reasoning, number ability, space ability, or mechanical comprehension required)

-- Personality (sociable, energetic, persuasive, careful with details, persistent, etc.)

-- Physical (height, weight, general health status, energy level, personal appearance, posture, voice, and manner of speaking, etc.)

-- Interests (outdoor, mechanical, computational, scientific, persuasive, artistic, literary, musical, social service, clerical)

E. Education and Training Required

-- Kind and level of education necessary (professional, technical, or general; graduate study, college degree, vocational school, high school, grade school; special skills and level of attainment to meet minimum qualifications)

-- In-service training on the job

-- Schools in the area which provide the type of training needed

-- How to gain admission to the type(s) of training needed

-- Limitation on number admitted to special training

-- Length of training in school and on the job

-- Probable cost

F. Methods of Entering the Occupation

-- Certificate, license, or diploma required

-- Types of formal examinations and/or proficiency tests which must be passed (where, when, how, and by whom given)

-- Sources of information concerning openings (special agencies that may assist [illegible]etting a job, etc.)

-- Required memberships in unions and/or professional societies

G. Possible Restrictions on Eligibility (age, sex, height or weight, physical handicaps, personal appearance, other)

H. Working Conditions

-- Hours of work (regular or irregular; overtime)

-- Indoor or outdoor (if outdoor, describe nature)

-- Travel (frequency and distance)

-- Health and accident hazards (noise or quiet; dust, dirt, oil, grease; odors; temperature extremes or sudden changes; dangers)

-- Work pace (busy seasons, constant rush, work against time, work under tension, slow pace and routine work, required output)

-- Changing procedures and creative demands

-- Work with others; alone; in the midst of activity

-- Closeness of supervision and supervisory responsibilities

I. Income, Advancement, and Security

-- Salary (beginning, yearly, monthly; at the end of first year; after five years)

-- Possibilities for promotion (related jobs to which transfer could be made, as a promotion or as a substitute for present job; difference in training or skills required; how to gain entrance)

-- Security offered (probational or tryout period, tenure, seniority, permanency of occupation)

-- Sick leave and vacation policy

-- Retirement (age, types of plans or provisions for, and pay)

-- Special benefits (insurance, hospitalization, company discounts, family recreation areas, etc.)

J. Organizations (Business, Civic, and Professional) to Which One Engaged in This Occupation Can Belong (name, purpose, activities, time and frequency of meetings, local chapter president, dues)

K. Advantages and Disadvantages of the Occupation (not mentioned previously)

L. What I Am Doing to Prepare Myself for This Occupation

M. Why I Think I Will Be Successful in This Occupation

N. Alternate Job Choices

O. Sources of Information Used (Check sources given below. Add extra pages if necessary)

-- Interviews (counselors; school officials; teachers; officers of trade, industrial, professional, and labor organizations; persons working in the occupation)

-- Libraries (college, high school, public, business department)

-- Current magazines

-- School catalogs

-- Material published by the Department of Labor, the state employment service, and/or community organizations

-- Personal visits to offices or plants where acutal work activities were observed

-- Radio and television programs

-- Motion pictures viewed

-- Tryout experiences (part-time or summer work experience)

P. Interview Form for You to Use When Talking with a Person Employed in Your Chosen Occupation

An interview with a _____
(Job title)

_____

_____

Suggestions for Use with Chapter 3, You and Your Job

Assemble as many sources of local summer employment as possible and share this information with the students

Have students add sources of local summer employment of which the teacher could have been unaware

Compile a list of sources of summer employment that are out of the local area (Students and teacher should work on this jointly.)

Suggestions for use with Chapter 5, You and Your Job

Have students select an ad from the ad sections available in the classroom (This ad should be about a job that fits in with the occupation that each student has studied. Students should have the teacher's approval of their chosen ad before they proceed.)

After a rough draft of the Letter of Application and Personal Data Sheet has been completed, check it and make any suggestions for improvement

Have students type the Letter of Application and Personal Data Sheet on typing paper as if actually being sent to a company

Additional Materials for Use with Chapter 6, You and Your Job

Obtain as many samples of application blanks as possible

Point out differences in these blanks

Suggestions for Use with Chapter 7, You and Your Job

Invite an individual who interviews employees for his company, professionally, to speak with the classes

Have some students interview each other (This will have to be well planned so that the student playing the role of the interviewer will know about the occupation for which he is interviewing the other student. This could be recorded and played back.)

After the students have written the thank-you letter, have them type the letter correctly, as it would look if they were going to mail it

ED096196

Suggestions for Use with Chapter 8, You and Your Job

Help the students to understand the forms necessary for employment by using transparencies, Job Finding TM 18, 19, 20 and 21 (See Appendix.)

Social Security Card

Employee's Withholding Exemption Certificate and information concerning who qualifies as a dependent

Pay check stub

Obtain the unit, Personal Development and Human Relations, prepared by Mrs. Mavis C. Sparks from the Instructional Materials Laboratory, University of Kentucky, Lexington, Kentucky 40506 (Parts of this unit that will be the most benefical to the students may be used.)

68196197

WHO QUALIFIES AS YOUR DEPENDENTS?

1. Persons who receive more than half of their support from you during the year.

2. Persons who have less than $600 gross income of their own during the year.

3. Persons who are not claimed as exemptions by your husband (wife).

4. Persons who are citizens or residents of the U.S., or are residents of Canada, Mexico, the Republic of Panama or the Canal Zone.

5. Persons who have your home as their principal place of residence and have been members of your household for the entire year.

or

Any person who is related to you as

a. Son, daughter, grandchild, stepson

b. Father, mother, grandparent, stepfather, stepmother, father-in-law, mother-in-law

c. Brother, sister, stepbrother, stepsister, half brother, half sister, brother-in-law, sister-in-law

d. Uncle, aunt, nephew, niece (if related by blood)

Job Finding TM20

0198

ADDITIONAL ACTIVITIES

Speakers and guests from the work world can bring enthusiasm and valuable information to students in the classroom; field trips can provide enriching learning experiences.

Classroom Speakers

Always prepare students before the day that the speaker is to come so that some thought can be given to questions concerning his occupation or company that the students would like to have him answer. Make sure to request each speaker to leave some time after his presentation for a question-answer period or some dialogue between him and the students.

Invite an individual who started to work immediately upon graduation from high school and who has done well in his chosen occupation. Have him share his "success story" with the classes. This will be genuine proof of success and should provide a challenge to the students. Schedule this guest near the beginning of the school year. Later in the year it may be desirable to invite another individual, provided he is another excellent example of success.

Have the School Representative of the local telephone company come to talk with the class about telephone manners and usage. In almost all occupations an individual talks on the telephone to some extent. Ask the School Representative to record the voices of some members of the class and play them back. Discuss their telephone usage. The representative will have special equipment to do this. South Central Bell Telephone Company provides, upon request, a brochure, Lecture-Demonstrations, Booklets, Films, Teaching Aids, and Tours, offering additional services.

The Recruiting Supervisor from the local telephone company will come to inform the students about the kinds of jobs available in the telephone business. Most students will be unaware of all but the most common ones, such as, telephone operator and lineman. Usually this individual does some interviewing for the company and can give excellent suggestions about the necessary qualifications, interviews, and applications.

A personnel manager of any large business or industry in the area can provide the students with information concerning the different kinds of jobs available in his organization, qualifications required for the jobs, and desirable work habits. If more than one large company or industry is in the area, the personnel manager can be scheduled at intervals during the year.

The local Pitney-Bowes office can acquire their latest films on equipment. Invite a representative to show several of these films to the students. These films expose students to newer and larger machines than are in the laboratory. After showing the films, the representative may talk with the students about the kinds of jobs available with Pitney-Bowes, and necessary qualifications and training.

Field Trip

Preparation is also necessary before field trips are taken. The day before the trip, try to generate interest and enthusiasm. Point out to students anything which should be given special attention during the trip. The day after the field trip have a follow-up discussion.

Arrange a field trip to Pitney-Bowes later in the year to see their display of equipment. Employees of Pitney-Bowes will demonstrate the operation of the machines. Students find this informative and interesting.

Supplementary Work

Since the volume of work may not be uniform throughout the year, the teacher may need short-term activities for use when there are no jobs available.

The number and the volume of jobs may vary from year to year. The following short-term activities may be used when time permits.

Interaction Briefs. This is a topic in each issue of Today's Education (National Education Association Journal). Three have been used and were very interesting to the students: "An Experiment in Communication (September, 1969); "An Experiment in Cooperation" (October, 1969); and "Looking at Leadership" (January, 1970). It is likely that in the future additional ones will be printed that will be applicable to any classroom.

Cross Media Kit on Consumer Education. This kit includes a sound filmstrip, Getting Credit; transparency masters; lesson plans; worksheets; and a teacher's manual. It is quite possible that the A-V Librarian has it or may get it from the NEA Publications Division.

Consumer Finance. A teacher's kit which contains all the material needed for a one-week teaching unit on comsumer finance may be ordered from
Educational Services Division
National Consumer Finance Association
1000 Sixteenth Street, N. W.
Washington, D. C. 20036

Filing. This may be developed by the individual teacher or "Gregg Quick Filing Practice Set" may be used.

Caring for Your Money. This unit could include budgeting, process of opening a bank account, proper way to write checks, bank reconciliation and banking services.

APPENDICES

TIPS FOR USING THE TRANSPARENCY MASTERS[1]

Making Transparencies from the Masters

To make transparencies from the following pages in only a few seconds, just run the master in contact with a transparency film on top of the master (with the notch in the upper right hand corner) through a dry photo copy machine. Color may be added by using special transparency films, special colored pencils, or special marking pens.

Additional masters may be made by using a typewriter and a Number 2 pencil. Multilith copies and illustrations printed in permanent or carbonbase ink will also copy.

Using the Transparencies Effectively in Classroom Presentations

The transparencies should be used to promote more vivid understanding of the content being presented. They should help clarify points and should be selected carefully so that they will contribute to the smooth flow of instruction rather than being thrown in as a gimmick.

The following suggestions will enable the teacher to gain more satisfactory results from using the transparency as a teaching tool:

1. Use a pointer at the transparency to direct attention to a detail; the pointer will show on the screen.

2. Use a grease pencil or a china-marking pencil to add details or mark points while the transparency is being projected for discussion. The marks may be wiped off later with a soft dry cloth or a piece of paper. (A white grease pencil will not show on the hands or face.)

3. Control the rate of presentation by covering the transparency with a piece of paper and exposing each point of information as you are ready to discuss it. Presenting one line or column at a time is helpful.

4. Use overlays to break complex ideas and present them in the proper order.

5. When writing on transparencies, eliminate glare by using a sheet of paper to cover the transparency below the writing surface. Light around a transparency may also be eliminated by taping paper on the base of the projector (if frames are not used).

6. Insure exact alignment of overlays by placing small crosses on the overlays at the points where they should be matched with the basic transparency to provide a margin against which overlays may rest as a guide to placement.

---

EMPLOYEE'S WITHHOLDING EXEMPTION CERTIFICATE

Type or print full name _____ Social Security Number _____

Home address _____ City _____ State _____ ZIP code _____

EMPLOYEE: File this form with your employer. Otherwise, he must withhold U.S. income tax from your wages without exemption.

EMPLOYER: Keep this certificate with your records. If the employee is believed to have claimed too many exemptions, the District Director should be so advised.

HOW TO CLAIM YOUR WITHHOLDING EXEMPTIONS

1. If SINGLE (or if married and wish withholding as single person), write "1." If you claim no exemptions, write "0" . . . _____
2. If MARRIED, one exemption each is allowable for husband and wife if not claimed on another certificate.
   (a) If you claim both of these exemptions, write "2"; (b) If you claim one of these exemptions, write "1"; (c) If you claim neither of these exemptions, write "0" . . . _____
3. Exemptions for age and blindness (applicable only to you and your wife but not to dependents):
   (a) If you or your wife will be 65 years of age or older at the end of the year, and you claim this exemption, write "1"; if both will be 65 or older, and you claim both of these exemptions, write "2" . . . _____
   (b) If you or your wife are blind, and you claim this exemption, write "1"; if both are blind, and you claim both of these exemptions, write "2" . . . _____
4. If you claim exemptions for one or more dependents, write the number of such exemptions. (Do not claim exemption for a dependent unless you are qualified under Instruction 4 on other side.). . . . _____
5. If you claim additional withholding allowances for itemized deductions fill out and attach Schedule A (Form W-4), and enter the number of allowances claimed (if claimed file new Form W-4 each year) . . . _____
6. Add the exemptions and allowances (if any) which you have claimed above and write total . . . [ ]
7. Additional withholding per pay period under agreement with employer. (See Instruction 1.) . . . $

I CERTIFY that the number of withholding exemptions claimed on this certificate does not exceed the number to which I am entitled. 648—10—79061-1

(Date) _____, 19____ (Signed) _____

1. This form helps the employer determine how much Federal income tax to withhold from the employee's wages.

2. Only the correct number of exemptions should be claimed.

3. An employee may claim fewer exemptions than he actually has, but not more. Claiming fewer exemptions results in more tax being deducted from the pay check.

4. A new certificate should be filed when the number of exemptions changes. It <u>must</u> be filed within 10 days when the number <u>decreases</u>.

Course Outline for Introduction to the World of Work (Seventh Grade).

Alabama State Dept. of Education, Montgomery. Agricultural Education Service.
MF AVAILABLE IN VT-ERIC SET.
Vocational Agricultural Education, Field Office, 101 Petrie Hall, Auburn, Alabama 36830 (free to State Supervisors and Head Teacher Educators only).
PUB DATE - 70 35p.

DESCRIPTORS - *TEACHING GUIDES; CURRICULUM GUIDES; PREVOCATIONAL EDUCATION; *OCCUPATIONAL INFORMATION; OCCUPATIONAL CHOICE; OCCUPATIONAL ASPIRATION; *COURSE CONTENT; GRADE 7; UNITS OF STUDY (SUBJECT FIELDS); UNIT PLAN; *INDUSTRIAL ARTS
IDENTIFIERS - *OCCUPATIONAL EXPLORATION

ABSTRACT - Prepared by the Alabama State Department of Education, this course outline is designed as an introduction to occupations for seventh grade students. The 26 units, presented for each month of the school year, provide topical outlines and references for (1) job descriptions including opportunities and general skill requirements, (2) some study of life science, and (3) study and practice of simple hand tools and elementary skills with wood, leather, plastic, electricity, and other simple arts and crafts. An introductory section provides a description, purposes, and objectives of the course. A bibliography and a Widening Occupational Roles Kit are included. (FM)

INTRODUCTION TO THE WORLD OF WORK
(Seventh Grade)

Description of Course

This course is an introduction to occupations in the world of work. Some study of life science, including the knowledge and skills required of the occupations in the state and the nation, is presented. Simple hand shop tools and elementary basic skills are studied and practiced with wood, leather, plastic, electricity and other simple arts and crafts. This is an exploratory course of occupational job descriptions including opportunities and general skill requirements in the world of work. The quality and richness of this course will depend largely upon the ingenuity and initiative of each teacher.

Purposes of Course

1. Create favorable attitudes to the world of work in relation to the home, community, state, and nation.

    a. Install pride in workmanship
    b. Encourage dignity of work

2. Develop an awareness of students to the world of work in the home, community, state, and nation.

3. Development of simple motor skills.

Objectives of Course

1. To develop pride in workmanship.

2. To develop an appreciation for the dignity of work.

3. To develop a comprehension of occupational classification levels.

4. To develop a comprehension of occupational cluster categories.

5. To develop the ability to evaluate personal assets and liabilities as related to occupational opportunities.

6. To develop the ability of students to realistically select occupational goals from available alternatives.

7. To develop simple motor skills.

    a. To develop the ability of students to associate tools with intended purposes.

    b. To develop a safety attitude.

    c. To develop the ability to follow instructions.

a. Some other manual occupations	
(1) Assemblers	
(2) Automobile painters	
(3) Automobile trimmers and installation men (upholsterers)	
(4) Blacksmiths	
(5) Boilermaking occupations	
(6) Dispensing opticians and optical mechanics	
(7) Electroplaters	
(8) Furniture upholsterers	
(9) Gasoline service station attendants	
(10) Inspectors (manufacturing)	
(11) Jewelers and jewelry repairmen	
(12) Motion picture projectionists	
(13) Photographic laboratory occupations	
(14) Power truck operators	
(15) Production painters	
(16) Shoe repairmen	
(17) Stationary engineers	
(18) Stationary fireman (boiler)	
(19) Welders and oxygen and arc cutters	
2. Some major industries and their occupations	
a. Manufacturing	
(1) Aircraft, missile, and spacecraft manufacturing	
(2) Aluminum industry	
(3) Apparel industry	
(4) Atomic energy field	
(5) Baking industry	
(6) Electronics manufacturing

ABSTRACT - This unit outline, which was prepared by the Alabama State Department of Education for eighth grade students, covers the work opportunities and requirements in elementary agribusiness science and industry. The 23 units, presented for each month of the school year, provide for laboratory experiences in occupational arts and crafts, including the identification, use, and care of hand tools, hardware, woods, leather, metals and other materials. Each unit consists of a content outline, suggested activities, and references. Appended are audio-visual aids, a bibliography, and an occupational kit. (FM)

EXPLORING THE WORLD OF WORK

Purpose of the Course

This is an exploratory course of the work opportunities and requirements in elementary agribusiness science and industry. This course in occupational arts and crafts includes the identification, use and care of hand tools, hardware, woods, leather, metals and other materials. Students are given a general picture of agriculture and industry and receive elementary laboratory experiences in the many areas of the World of Work. The course includes instruction on professional occupations in addition to jobs in agribusiness and basic industry.

Course Objectives

1. To give students a general picture of agriculture and industry and a knowledge of the job opportunities available in these fields.

2. To assist students in gaining some knowledge of the many areas of the world of work.

3. To assist students in developing leadership abilities through FFA activities.

4. To introduce students to simple arts and crafts to assist them in determineing interests and abilities in these areas.

EXPLORING THE WORLD OF WORK

(Eighth Grade)

SEPTEMBER

Units	References and Teacher Comments
I. Orientation and General Information	
A. Purpose and value of course	
B. Department policies and goals	
C. References and supplies	
D. Introduction to youth organizations (FFA)	
1. FFA is a definite part of the course. Students should take advantage of the leadership development opportunities this part of the course affords.	
2. Organization	Official FFA Manual "Parliamentary Procedure for FFA Chapters"
a. History	
b. Aims	
c. Purposes	
d. Membership	
e. Degrees	
f. Advantage of membership	
3. Leadership	"Your Opportunities in Vocational Agriculture"
a. How to be a good FFA member	
b. Conducting effective meetings	
c. Parliamentary procedure	
d. Duties and responsibilities of members	
e. Characteristics of leadership	
4. Suggested learning activities	
a. Conduct a tour of facilities	
b. Have students make brief reports on some phase of FFA	
c. Practice opening and closing ceremonies with class	
d. Review contest application forms with students	
e. Invite the FFA president to discuss the work of organization	
f. Others	

Exploring the World of Work, cont'd
(Eighth Grade)

SEPTEMBER cont'd

Units	References and Teacher Comments
II. Our World of Work	
A. Changes in our economy	
1. Better living 2. Automation and shorter work week	
B. Importance of training for a job	
1. Why some jobs pay more 2. Jobs you are interested in	
C. The industrial world	
1. Where the jobs are 2. Kinds of industries in the world of work	
D. The occupational world	"Our World of Work" (Pages 14-48) "Exploring the World of Jobs"
1. Variety of occupations 2. White collar workers 3. Professional occupations 4. Managerial jobs 5. Clerical 6. Sales 7. The craftsman 8. Agricultural occupations 9. Service occupations	
E. Suggested learning activities	
1. Make a list of ten occupations that did not exist in 1900 2. Assign students to study the Industrial Revolution and write narrative description 3. Show filmstrip: "Preparing for Jobs in the 70's", Guidance Associates, Inc. Pleasantville, New York 10570	
F. Others

Units	References and Teacher Comments
III. Jobs in Your Future	
A. Review student's interests and abilities	"Jobs in Your Future" (Pages 6-38)
1. Who are you?	"Occupational Outlook Handbook"
2. What will you be doing ten years from now?	
B. What can you do?	
C. What can you do now?	
1. Three laws about jobs	
2. Why you should stay in school	
3. Education and jobs in your future	
D. Job interest fields	
1. Literary work	
2. Scientific work	
3. Mechanical work	
4. Clerical work	
5. Persuasive work	
6. Outdoor work	
7. Service work	
8. Artistic work	
E. Suggested learning activities	
1. List and discuss occupations under the eight interest fields	
2. Complete exercises in "Jobs in Your Future"	
3. Use "Widening Occupational Roles Kit", if available	
4. Bring local newspaper to class and study advertisements and want-ad section. Observe what job openings are listed. What training, salary and opportunities for promotion would apply to these jobs.	
5. Use flash cards to identify the hand tools that will be used later in the arts and crafts part of this course.

OCTOBER

Units	References and Teacher Comments
I. Wood Crafts	
A. Uses of forest products	
B. Trees - description and location	
C. Figuring board measure	
D. Safety	"Exploring the Industries"
E. Measuring and laying out	
F. Gauging width and thickness	
G. Sawing across or with the grain	"General Shop"
H. Assembling and adjusting planes, spoke shaves, and cabinet scrapers	
I. Boring and drilling holes	
J. Fastening with screws	
K. Driving and pulling nails	
L. Cutting and trimming with the chisel	
M. Sharpening tools	
N. Sanding for finishing	
O. Gluing and clamping	
P. Wood finishing	
1. Paint and enamel	
2. Stain	
3. Woodfiller	
4. Shellac	
5. Varnish	
6. Applying a penetrating finish	
7. Rubbing varnish surfaces	
8. Care of brushes	
Q. Suggested learning activities	
1. Figure a bill of materials	
2. Measuring and sawing wood	
3. Use hammer, plane, and chisel	
4. Sand, assemble and finish a wood project in worktext or textbook	
5. Complete exercises in worktext	
6. Examination	
7. Perform the following exercises:	
a. Mix paint ready for use	
b. Prepare a board surface for painting	
c. Apply paint to wood surfaces	
d. Discuss common paint failures	
e. Prepare board and apply varnish finish	

Exploring the World of Work, cont'd

1. Order free kit: "How Steel is Made" includes bottled sample of raw materials and color filmstrip, Chicago Film Distribution Center, U. S. Steel Corp., 208 South LaSalle Street, Chicago, Illinois 60690	
2. Students complete problems in work-text	
3. Show film "Precision Tool Making and Machining" Modern Talking Pictures Service	
4. Use hacksaw, cold chisel, file, and center punch	
5. Students do exercises in drilling threading and tapping	
III. <u>Sheet Metal</u>	"Exploring the Industries"
A. Introduction	
B. Measuring and laying out	"General Shop"
C. Cutting	

Exploring the World of Work, cont'd
(Eighth Grade)

FEBRUARY cont'd

Units	References and Teacher Comments
D. Folding and forming E. Common joints 1. Lap seam 2. Folded seam 3. Grooved folded seam 4. Burred edge seam 5. Double seam F. Soldering 1. Definition of soldering 2. Soldering materials 3. Soldering tools 4. Tinning a soldering copper 5. Soldering a joint G. Suggested learning activities 1. Students complete problems in worktext 2. Student complete one of suggested metal projects in worktext 3. Examination 4. Make one of the following items: a. Dustpan b. Feed scoop c. Funnel d. Sugar scoop e. Tool box	

Exploring the World of Work, cont'd
(Eighth Grade)

MARCH

Units	References and Teacher Comments
I. Careers in Electricity	
A. History and trend B. Jobs in electricity and electronics	"Exploring the Industries"
1. Electrical technician 2. Electrical testing specialist 3. Engineers 4. Electronics technician 5. Linesman 6. Electrician 7. Others	"Occupational Outlook Handbook"
C. Working conditions	
1. Type of work 2. Where work is done 3. What workers like about occupation 4. What workers dislike about occupation 5. Advantages of careers in electricity 6. Disadvantages	
D. Suggested learning activities	
1. Show film "Your Future in Electronics" RCA Institute, Inc., 350 W. 4th St., New York, N. Y. 2. Show film "The Electronics Technician" Modern Talking Service, 501 N. College St., Charlotte, N. C. 28202 3. Invite resource person from Ala. Power Co. or Electricial Co-op to discuss electrical occupations 4. Show film "The Electrical Worker" Modern Talking Picture Service 5. Use "Widening Occupational Roles Kit" if available for individual and group study. Science Research associates, Inc.	
II. Electricity	
A. Safety B. Sources of electricity	"Exploring the Industries"

Exploring the World of Work, cont'd
(Eighth Grade)

MARCH cont'd

Units	References and Teacher Comments
1. Dry cell 2. Wet cell 3. Generators	"General Shop"
C. Conductors and insulators	
D. Magnetism in our lives	
1. Permanent magnetism 2. Electromagnetism	
E. Elementary applied electricity	
1. Current 2. Resistance 3. Voltage 4. Series connection 5. Parallel connection 6. Ohm's law	
F. Splices	
1. Western union 2. Tap 3. Pigtail 4. Extension cord	
G. Cord repairs	
1. Underwriter's knot 2. Fastening plug	
H. Soldering	
I. Wiring diamgrams	
J. Electrical maintenance	
K. Fuses	
L. Suggested learning activities	
1. Complete problems in worktext 2. Divide class into groups and construct one of suggested electrical projects in worktext - doorbell, dry cell, buzzer or motor 3. Students practice making splices and cord repair 4. Examination	

Exploring the World of Work, cont'd
(Eighth Grade)

MARCH cont'd

Units	References and Teacher Comments
5. Record wire sizes of different kinds of wire 6. Make a Western Union or end splice 7. Make a knotted tap splice 8. Make a hook on the end of a wire 9. Make an underwriting knot 10. Attach plug and socket to a cord 11. Attach appliance plug to a cord 12. Make an extension cord for home use 13. Assemble lamp project	
III. <u>Careers in Mechanics</u> A. History and trend B. Jobs in mechanics 1. Auto mechanics 2. Small engine mechanic 3. Tractor and machinery mechanic 4. Diesel mechanic 5. Millwright 6. Others C. Working conditions 1. Type of work 2. Where work is done 3. What workers like about occupation 4. What workers dislike about occupation 5. Advantages of careers in mechanics 6. Disadvantages D. Suggested learning activities 1. Show film "The Motor Mechanics" Modern Talking Picture Service 2. Visit or arrange a representative from a vocational school to discuss mechanics occupations 3. Discuss sections on mechanics in "Occupational Outlook Handbook"	"Occupational Outlook Handbook" (Pages 398-431)

Exploring the World of Work, cont'd
(Eighth Grade)

APRIL

Units	References and Teacher Comments
I. Mechanics of Machines	"Power Goes to Work"
A. Types of simple machines	"General Shop"
1. Lever	
2. Pulley	
3. Wheel and axle	
4. Inclined plane	
5. Wedge	
6. Screw	
B. Definition of mechanical advantage	
C. Definition of work	
D. Ways of putting power to work	
E. Tools, wrenches, gauges, and fasteners	
1. Threaded metal fasteners	
2. Tools for assembling	
3. Bolts, nuts, and screws	
4. Hints for using wrenches	
5. Gauges	
F. Suggested learning activities	
1. Show film "ABC's of Hand Tools-Part I and II" (General Motors)	
2. Demonstrate use of simple machine machines	
II. Engines	
A. Steam	"General Shop"
B. Internal - combustion	"Small Engines, Vol. I"
1. How small gasoline engine works	
2. Importance of proper care and operation	
3. Safety in operating power mowers	
4. Selecting power mowers	
5. Servicing small engines (Demonstration by teacher)	
a. Cleaning	
b. Servicing air cleaners	
c. Servicing fuel strainers	

Exploring the World of Work, cont'd
(Eighth Grade)

APRIL cont'd

Units	References and Teacher Comments
d. Lubricanting e. Refueling f. Servicing spark plugs g. Checking and adjusting carburetors	
C. Diesel	
D. Suggested learning activities	"Occupational Outlook Handbook" (Pages 318-362)
1. Show film "Where Mileage Begins" General Motors Corporation	
2. Disassemble a small four-stroke engine (demonstration by teacher)	"Exploring the Industries"
3. Build a model engine (hobby store type)	"General Shop"
4. Service a power mower	
III. <u>Careers in Building Trades</u>	
A. History and trend	
B. Jobs in building trades	
1. Carpenters 2. Painters 3. Plumbers and pipe fitters 4. Bricklayer 5. Electrician 6. Roofer 7. Cement masons 8. Plasterers 9. Others	
C. Working conditions	
1. Type of work 2. Where work is done 3. What workers like about occupation 4. What workers dislike about occupation 5. Advantages of careers in building 6. Disadvantages	
D. Suggested learning activities	
1. Use "Widening Occupations Roles Kit (WORK)" if available for individual and group study, Science Research Associates	

Exploring the World of Work, cont'd

MAY

Units	References and Teacher Comments
I. Personal Development	"Personal Development for Successful Employment"
A. Developing good health habits	
1. Importance	"Your Opportunities in Vocational Agriculture"
2. Proper eating habits	
3. Proper rest	
4. Exercise	
5. Cleanliness	
B. Selecting and buying clothes	
C. Caring for clothes	
D. Developing desirable social characteristics	
1. Manners	
2. Courtesy	
3. Getting along with people	
E. Improving personal appearance	
F. Respect of law and authority	
G. Suggested learning activities	
1. Role playing:	
a. Manners	
b. Table manners	
c. Courtesy	
d. Personal appearance	
2. Invite a law enforcement authority to discuss respect of law, authority, and property	
3.	
II. Tomorrow's Jobs	"Occupational Outlook Handbook" (Pages 13-27)
A. Our labor force	
B. How most people make their living	
C. Future manpower requirements	
1. In the professions	
2. Clerical occupations	
3. Managerial occupations	
4. Sales occupations	
5. Service occupations	
6. Skilled occupations	
7. Semi-skilled occupations	
8. Others

(Eighth Grade)

Widening Occupational Roles Kit*

WORK is an occupational study system designed to give students in grades six through nine a chance to broaden their knowledge of the world of work. Source: Science Research Associates, 259 East Erie Street, Chicago, Illinois. Price: $141.75

WORK includes:

400 Junior Occupational Briefs
5 Junior Guidance Booklets
35 Student Workbooks
1 Teacher's Manual
5 Color Filmstrips

Audio-Visual Aids

1. Guidance Associates, Inc., Pleasantville, N. Y. 10570. Filmstrip: "Preparing for Jobs in the 70's."

2. Wilson Corporation, 555 West 166th Street, South Holland, Illinois 60473. Records: "Exploring the World of Work," set of six, 12" LP records.

3. Association Films, Inc., 347 Madison Avenue, New York, N. Y. Film: "The Big Question - Choosing Your Career."

4. Modern Talking Pictures Service, Inc., 501 N. College Street, Charlotte, N. C. 28202. Films: "The Draftsman - Surveyor." "Precision Tool Making and Machining," "The Electronics Technician," "The Electrical Worker," "The Motor Mechanic." Filmstrip: "Sexual Reproduction in Plants."

5. General Motors Corporation, Public Relations Staff, Film Library General Motors Building, Detroit, Michigan 48202. "Engineers in the Making," "ABC's of Hand Tools, Part I & II," and "Where Mileage Begins."

6. Coronet Instructional Films, 65 East South Water Street, Chicago Illinois 60601. Film: "Careers in the Building Trades."

7. RCA Institute, Inc., 350 West 4th Street, New York, New York, Film: "Your Future in Electronics."

8. Chicago Film Distribution Center, U. S. Steel Corporation, 208 South LaSalle Street, Chicago, Illinois 60690. Kit: "How Steel is Made." Includes bottled sample of raw materials and color filmstrip. Free

9. Vo-Ag Film Libriary, Auburn University. Film: "Dynamic Careers Through Agriculture."

10. New Holland Film Library, Memphis, Tennessee. Film: "A Step Ahead."

11. Bureau of Labor Statistics, U. S. Department of Labor, 341 - 9th Avenue, New York, N. Y. 10001. Slide Set: "Looking Ahead to a Career."

---

*WORK would be a valuable addition to the school library or guidance service making it available to all departments.

**Junior Occupational Briefs can be ordered individually or as a complete set. Price: $89.50

IDENTIFIERS - *AGRIBUSINESS

ABSTRACT - Prepared for an orientation of 9th grade students interested in agribusiness, this course outline was developed by the Agriculture Education Service of a State Department of Education. The outline contains units of instruction keyed to each month of the school year, and each unit includes an introduction, reference list, suggested learning activities, and a provision for additional teacher comments. The units are also keyed to occupational objectives in agribusiness and basic trades. (LM)

COURSE OUTLINE
FOR
VOCATIONAL ORIENTATION
(Ninth Grade)

SEPTEMBER

Units	References and Teacher Comments
I. Orientation & General Information	
A. Introduction to course	
1. Purpose of course 2. Department goals and policies 3. Dues, forms, etc. 4. Setting up student notebook 5. Plans for the year 6. Tour of facilities 7. Others	
B. Supervised work experience program	"Your Opportunities in Vocational Agriculture"
1. Determining the type program 2. Setting individual goals 3. Starting supervised programs 4. Production projects 5. Improvement projects 6. Supplementary practices 7. Financing supervised programs 8. Keeping records 9. Placement for work experience 10. Others	"Supervised Practice Program Record Book" "Suggested Teaching Outline for Life Science & General Shop"

OCCUPATIONAL OBJECTIVES IN AGRIBUSINESS

1. Agricultural Production
2. Agricultural Supplies
3. Agricultural Mechanics
4. Agricultural Products
5. Ornamental Horticulture
6. Agricultural Resources
7. Forestry
8. Pre-Professional (Other)

OCCUPATIONAL OBJECTIVES IN BASIC TRADES

1. Metal Work
2. Wood Work
3. Trowel Trades
4. Construction
5. Mechanics
6. Electricity
7. Other

SEPTEMBER cont'd

Units	References and Teacher Comments
11. Suggested learning activities	
a. Determine whether the following are productive, improvement, or supplementary practices	
(1) Sow and litter (2) Corn (3) Broilers (4) Watermelons (5) Pasture improvement (6) Spraying peach trees (7) Castrating pigs (8) Others	
b. Give students a list of transactions to practice entering in a "dummy" record book	
c. Have students make a list of possible places in community for work experience	
d. Others	
C. Youth Organizations (FFA)	"Official FFA Manual"
1. Organization	"Suggested Teaching Outlines for Life Sciences and General Shop"
a. Histroy b. Aims c. Purposes d. Membership e. Degrees	"Parliamentary Procedure for FFA Chapters"
2. Leadership	"Now You're Talking"
a. Public speaking b. Conducting effective meetings c. Parliamentary procedure d. Duties and responsibilities of members e. Characteristics of leadership	
3. Contests and awards	"Alabama FFA Contests and Awards"
a. Awards program b. Individual and group contests c. Others	
4. Suggested learning activities	
a. Have students make brief reports on some phase of FFA b. Practice opening and closing ceremonies with class c. Review contest application forms with students d. Others

OCTOBER

Units	References and Teacher Comments
I. Shop Management and Safety	
A. Advantages of shop work B. Arrangement of tools and equipment C. Housekeeping in the shop D. Student behavior in the shop E. Safety precautions F. Safety devices G. Suggested learning activities	"Suggested Teaching Outline for Life Science & General Shop" "General Shop Guide for Vo-Ag Students" "Farm Mechanics Text and Handbook"
1. Students study and complete pages 1-11 in "General Shop Guide for Vo-Ag Students" 2. Demonstrate safety devices 3. Develop housekeeping chart 4. Tour shop with students 5. Others	
II. Introduction to Sketching, Drawing, and Planning	
A. Importance of planning and drawing B. Job opportunities in this field C. Type training required for employment D. Where training may be obtained E. Working conditions and pay expected F. Instructional areas	"General Shop Guide for Vo-Ag Students" "Exploring the Industries" "Farm Mechanics Text and Handbook" "The Farm Shop" "General Shop, 3rd Edition"
1. Drawing equipment 2. Lettering and freehand drawing 3. Determining angles 4. Angle layout 5. Alphabet of lines 6. Placing dimensions 7. Reading the architect's scale 8. Learning to draw to scale 9. Isometric drawing principles	
G. Suggested learning activities	
1. Study and complete pages 83-97 in "General Shop Guide for Vo-Ag Students" 2. Visit an architect's office to observe type work done and equipment used 3. Have students draw a plan for a proposed shop project 4. Others	

92

OCTOBER cont'd

Units	References and Teacher Comments
III. Introduction to Mechanics	
A. Job opportunities in mechanics	"Occupational Outlook Handbook"
1. Automobiles 2. Trucks 3. Diesel 4. Tractors 5. Small motors	"Auto Mechanics Fundamentals" (Chapter 7, 22) "Small Engines, Care-Operation-Maintenance and Repair-Vol. I"
B. Description and nature of work C. Working conditions D. Training requirements E. Where training may be obtained F. How to enter and advance G. Instructional area	
1. Engine classification, parts identification	
a. Cycle classification	
(1) Four-stroke cycle (2) Two-stroke cycle	
b. Valve location classification	
(1) L-head (2) F-head (3) I-head (4) T-head	
c. Combustion chamber design d. Cylinder classification	
(1) In-line engine (2) V-type engine (3) Horizontal-opposed engine (4) Slant or inclined	
e. Fuel classification f. Engine mountings	
H. Suggested learning activities	
1. Study and answer questions on page 179, "Auto Mechanics Fundamentals" 2. Perform the following exercises on a small gasoline engine	

OCTOBER cont'd

Units	References and Teacher Comments
a. Identify types of small engines b. Clean small engines c. Service carburetor air cleaner d. Service fuel strainer e. Service crankcase breather f. Lubricate small engine g. Refuel small engine (1) Select the fuel (2) Tools and materials needed (3) Prepare fuel for two-cycle engine (4) Filling the fuel tank (5) Storing fuel h. Service spark plugs (1) Types of spark plugs (2) Importance of proper maintenance (3) Inspecting and servicing spark plugs (4) Installing the spark plug i. Check and adjust carburetor (1) Principles of operation (2) Tools and materials needed (3) Adjust high speed and idle valve j. Check compression k. Starting engines l. Operating engines m. Storing engines	

NOVEMBER

Units	References and Teacher Comments
I. Introduction to Woodworking Industry	
A. History of this industry	"Farm Mechanics Text and Handbook"
B. Opportunities for employment	
C. Chances for promotion	
D. Working conditions	"The Farm Shop"
E. Wages expected	
F. Qualifications and training needed	"General Shop Guide for Vo-Ag Students" (Pages 12-50)
G. How to enter a job in woodworking industry	
H. Identification and use of hand tools used in woodworking industry	"General Shop, 3rd Edition"
1. Marking and measuring tools	
2. Boring and drilling tools	"Tool Study and Identification Kit"
3. Smoothing and cutting tools	
4. Clamping devices	
5. Hammers and wood malls	
6. Saws	
7. Screwdrivers and files	
8. Painting and glazing	
9. Levels	
I. Power tool study	
1. Identification, safe use, and adjustment of power woodworking tools	Note: Students study and complete pages 51-82 in "General Shop Guide for Vo-Ag Students"
a. Circular saw (tilting arbor)	
b. Bandsaw	
c. Jig saw	
d. Drill press	
e. Portable electric drill	
f. Grinder	
g. Disk sander	
h. Portable belt sander	
J. Identification--wood and hardware	Note: Students study and complete pages 98-108 in "General Shop Guide for Vo-Ag Students"
1. Selection and characteristics of wood	
2. Qualities of wood	
3. Joint identification	
4. Size and kind of nails	"Hardware Study and Identification Kit"
5. Size and kind of screws	
6. Identification of common hardware	
7. Others	

NOVEMBER cont'd

Units	References and Teacher Comments
K. Suggested learning activities	
1. Visit a woodworking shop to observe type of work done and tools used	
2. Each student learn to adjust and use hand and power tools	
3. Each student build wood projects such as	
a. Tool box b. Nail box c. Miter box d. Footstool e. Lawn chair f. Gunrack g. Bookcase h. Sawhorse i. Kitchen stool j. Flower box k. Doghouse l. Others	Note: See pages 109-124 in "General Shop Guide for Vo-Ag Students"
4. Others	

DECEMBER

Units	References and Teacher Comments
I. Orientation to Agribusiness	
A. Agribusiness--Our Greatest Business	"Careers in Agribusiness and Industry" (Chapters 1, 2, 3)
1. What is agribusiness	
2. Agribusiness--a two-way street	
3. How big agribusiness is	"Handbook of Agricultural Occupations"
4. Overall view of agribusiness	
5. Agribusiness has a place for you	
6. Kinds of positions	
7. General view of opportunities in agribusiness	
8. What agribusiness graduates do, and whom they work for	
9. Salary you might expect	
10. Type person employers look for in a college graduate	
12. A look at the "merchandise" of agribusiness	
13. Amount farmers buy from agribusiness	
14. Suggested learning activities	
a. Briefly discuss chapters 1, 2, 3 in "Careers in Agribusiness and Industry"	
b. Have students list all agribusiness opportunities in their school area, county, or neighboring counties	
c. Visit an agribusiness establishment (store or farm)	
d. Others	
II. Introduction to Agricultural Production	
A. Opportunities in agricultural production	"An Introduction to Business & Industry"
1. Self-employment as owner or tenant	"Suggested Teaching Outlines for Life Science and General Shop"
2. Paid on-farm employee	
3. Possibilities in livestock production	
a. Scope of operation needed	"Agriculture in Our Lives"
b. Labor and capital needed	
c. Marketing facilities	
4. Possibilities in crop production	"Exploring Agriculture"
a. Scope of operation needed	
b. Labor and capital needed	
c. Marketing facilities	

DECEMBER cont'd

Units	References and Teacher Comments
5. Possibilities in horticulture production a. Scope of operation needed b. Labor and capital required c. Marketing facilities available 6. Other possibilities B. Qualities needed for success in farming 1. Business acumen 2. Practical scientist 3. Laborer 4. Skilled mechanic C. Suggested learning activities 1. Visit local farming operation to observe land, equipment, labor, etc. 2. Invite successful farmer to talk to class 3. Have each student list land, equipment, livestock, buildings, etc., for a proposed farm and make estimate of total cost or investment	

JANUARY

Units	References and Teacher Comments
I. Introduction to Agricultural Production (Cont'd from December)	
A. Principles of crop production	"Agriculture in Our Lives"
1. Principles of plant growth	
a. Seeds and their function b. Plant reproduction, pollination, fertilization c. Germination of seed d. How plants make their food e. Water and its relationship to plant growth f. Temperature and its relationship to plant growth g. Causes of plant diseases h. Families of common plants i. Cultivation practices for various crops j. Suggested learning activities	"Crop Production in the South" "Suggested Teaching Outline for Life Science and General Shop" "1961 Yearbook of Agriculture--Seeds"
(1) Have students make "rag-doll" germination seed test (2) Identify parts of seed (3) Plant seed in window boxes, etc., to observe growth (4) Others	
2. Plant food and fertilizer	"Plant Food & Fertilizers"
a. How plants feed and grow b. Fertilizer elements needed for plant growth c. Effects of fertilizers on the soil d. What the major plant food elements do to a plant e. Trace minerals and their effect on plants and animals f. Mathematical calculations of plant food needs g. Value of soil testing h. Methods of applying fertilizer i. Suggested learning activities	"Agriculture in Our Lives" "Crop Production in the South"
(1) Determine what 8-8-8 represents on fertilizer bag	

JANUARY cont'd

Units	Reference and Teacher Comments
(2) Observe plants that are deficient in different plant foods	
(3) Take soil samples and send to soil testing laboratory	
(4) Visit farm supply store to observe different types of fertilizer available	
(5) Others	
B. Principles of livestock production	"Agriculture in Our Lives"
1. Introduction	
2. Value of farm animals	"Stockman's Handbook"
3. Farm animal classification	
4. Importance of domesticated animals	"Livestock and Poultry Production"
5. Breeds of dairy cattle, beef cattle, hogs, sheep, and poultry	
6. Livestock terms and definitions	"Suggested Teaching Outline for Life Science and General Shop"
7. Animal nutrition	
a. Why good feeding is important	
b. How animals use their feed	
c. Nutrients necessary for proper nourishment	
8. Animal breeding	
a. How animals were domesticated and improved	
b. Crossbreeds	
c. Hybrids	
d. Selection and judging	
e. Gestation periods	
9. Suggested learning activities	
a. Visit local farms to observe different breeds of livestock	
b. Show films and filmstrips on breeds	
c. Have students complete a "livestock term chart"	
d. Others	
II. Leadership (FFA)	
A. Developing public speaking skills	"Now You're Talking"
1. Selecting a topic	
2. Collecting material for speech	
3. Writing the speech	
4. Presenting speech before an audience	
5. Others	

FEBRUARY

Units	References and Teacher Comments
I. Introduction to Construction Industry	
A. Employment opportunities in building trades	"Occupational Outlook Handbook"
1. Asbestos and insulating workers	
2. Bricklayers	
3. Carpenters	
4. Cement masons	
5. Construction laborers and hod carriers	
6. Electricians (construction)	
7. Elevator constructors	
8. Floor covering installers	
9. Glaziers	
10. Lathers	
11. Marble setters, tile setters, and terrazzo workers	
12. Operating engineers (construction machinery operators)	
13. Painters and paperhangers	
14. Plasterers	
15. Plumbers and pipefitters	
16. Roofers	
17. Sheet metal workers	
18. Stonemasons	
19. Structural-, ornamental-, and reinforcing-iron workers, riggers, and machine movers	
B. Qualifications and training needed	
C. Where training may be obtained	
D. Working conditions	
E. How to enter and advance	
F. Waters expected	
G. Instructional units	
1. Figuring bills of materials	"Farm Mechanics Text and Handbook" (Chapter 6)
a. Bill of material	
b. Unit of measure in selling lumber	
c. Board foot and running foot	
d. Method used in writing dimensions	
e. Allowing extra materials for dressed lumber and for waste	
f. Calculating cost of lumber	
g. Shingles, lath, and molding	

FEBRUARY cont'd

Units	References and Teacher Comments
2. Suggested learning activities	
a. Study and answer questions	
b. Have each student classify, select and care for lumber properly	
c. Take field trip to building supply store to observe materials available	
d. Each student figure bill of material for a small shed or building	
e. Others

Electricity--Electronics. Syllabus in Technical Subjects, (Tentative).

New York State Education Dept., Albany. Bureau of Secondary Curriculum Development.
MF AVAILABLE IN VT-ERIC SET.
PUB DATE - 69 66p.

DESCRIPTORS - *CURRICULUM GUIDES; *TRADE AND INDUSTRIAL EDUCATION; *ELECTRICITY; *ELECTRONICS; *ELECTRONIC TECHNICIANS; TEACHING GUIDES; DRAFTING; ELECTRIC CIRCUITS; VOCATIONAL EDUCATION; TECHNICAL OCCUPATIONS; BIBLIOGRAPHIES

ABSTRACT - Developed by the Bureau of Secondary Curriculum Development of the New York State Education Department in cooperation with an advisory committee, this tentative curriculum guide is for instructor use in teaching technical electricity and electronics over a 2 or 3-year period. Topics are: (1) Electricity, which consists of 20 units, including circuits, measurements, conductors, magnetism, DC motors and generators, transformers, batteries, and relays, (2) electronics, which consists of 11 units, including electron theory and devices, communications, and circuiting, (3) Electrical Construction, which consists of four units, and (4) Electrical-Electronic Drafting, which consists of 13 units, including lettering, schematic layout procedures, and block diagram. Each unit is outlined with suggestions for teacher presentations. A bibliography is included, and an introductory section provides objectives, suggestions for the teacher, course descriptions, scheduling suggestions, and diploma requirements. (GEB)

FOREWORD

The material presented in this publication for *Technical Electricity and* and expansion of the syllabus in Technical Subjects Electricity and Electroni

A curriculum advisory committee composed of Neil Lash, Technical and Tra County BOCES; Arthur Lefgren, George Westinghouse Vocational and Technical Hi Nagi, Hudson Valley Community College; and James Quinn, Brooklyn Technical Hi for the reorganization of the syllabus.

Serving on a curriculum writing committee were Neil Lash; Rocco Lapenta, High School, Yonkers; Stanley Odre, Hutchingson Central Technical High School Brooklyn Technical High School, New York, The committee prepared content and for this revised syllabus in Technical Electricity-Electronics.

The project was initiated by Nelson J. Murbach, former Chief of the Bure Education, and C. Thomas Olivo, former Director of the Division of Industrial and recommendations were provided by Alfred Davies and Harold Wassmer, Associ Coordination of the curriculum project was provided by Earl Hay, Supervisor o

This material is being distributed to all schools in New York State offe nical Electricity and Electronics with the hope that personnel involved will material, evaluate it, and submit suggestions for its improvement to this bur before final adoption.

  - An appreciation of the need for cooper
  - An appreciation of the laws and forces
    implications
  - A regard for the importance of safety
    cedures

C6664

OBJECTIVES

provide the student with a thorough grounding in the fundamental inciples and practices of electricity and electronics

provide the student with sufficient background material so he may ter industry in a technical or semi-technical position

provide the student with a technical educational foundation from ich he may readily advance through further study

aid the student in adapting himself to a technical environment in ich electricity and electronics play a part

develop, through the study of technical electricity in conjunction th other technical subjects, a type of individual, some of whose aracteristics will include:

- An established habit of judgment based on observed and verified facts
- The practice of facing new situations, based on the ability to apply known principles and reflective thought
- A desire to finish a job
- An appreciation of the need for cooperation and loyalty
- An appreciation of the laws and forces of nature and their implications
- A regard for the importance of safety and correct safety procedures

DESCRIPTION OF COURSES

BASIC ELECTRICITY - includes all phases of direct and alternating curre insulating materials, resistance, voltage, current distribution, energy struments and techniques; magnetism, inductance, and capacitance in alt of these concepts as analytical tools. The subject content is applied and teacher demonstrations throughout the course. Stress is placed upo oratory reports throughout all technical courses.

BASIC ELECTRONICS - subject content includes elements of electrical cir and gas tubes (diode, triode, and multi-electrodes) power supply system controls. Solid state physics is emphasized in order to assist student their association with other circuits. Laboratory experiments provide concepts through the use of standardized instruments.

ADVANCED ELECTRICITY - the basic power requirements of modern electrica phasized through generation and distribution of three phase power. Pow systems and the instrumentation of transformers is covered through the wye and delta transformers.

The latter section of the course includes rotary and magnetic ampli equipment, thyratron and silicon-controlled rectifier and their associa and servomechanisms with the transistor servoamplifier polyphase vacuum

ADVANCED ELECTRONICS - standard procedures used in industry in the des an electronic unit are studied. The performance of an electronic syst and frequency response is analyzed. Filter coupling, peaking, feed-ba veloped to achieve desired performance. The principles learned are ap and instrumentation circuits.

Also, the generation and shaping of pulse and ramp waves is studie are applied in the development of TV sweep, radar, and digital circuit

COMPUTER CIRCUITRY - various number systems including binary and octal diagrams and systems are analyzed. Problems in computer design stress using half and full-adder, shift register, and counters.

Computers are analyzed through the use of block diagrams and typic explained through the application of the atomic theory of matter and s symbols and configurations are integrated into circuit analysis. Tran current gain as it is effected by temperature is stressed in circuit d device, and control circuits as well as input-output devices is applie maintenance.

6348

DESCRIPTION OF COURSES

phases of direct and alternating current. The concepts of conductors
, voltage, current distribution, energy, work and power, measuring in-
ism, inductance, and capacitance in alternating currents; and the uses
tools. The subject content is applied in student laboratory experiments
ghout the course. Stress is placed upon proper format in writing lab-
echnical courses.

ent includes elements of electrical circuits, characteristics of vacuum
d multi-electrodes) power supply systems, simple amplifiers and industrial
s emphasized in order to assist students to analyze active devices and
cuits. Laboratory experiments provide practical application of electronic
dardized instruments.

power requirements of modern electrical and electronic technology as em-
distribution of three phase power. Power measurements in the three phase
of transformers is covered through the subject content of three phase

urse includes rotary and magnetic amplifiers, rotary energy conversion
-controlled rectifier and their associated control equipment; synchros
nsistor servoamplifier polyphase vacuum tube and semiconductor rectifiers.

procedures used in industry in the design, development, and production of
The performance of an electronic system with respect to noise, distortion,
zed. Filter coupling, peaking, feed-back, and push-pull circuits are de-
ormance. The principles learned are applied to audio, AM, FM, TV control,

aping of pulse and ramp waves is studied analytically. These principles
of TV sweep, radar, and digital circuits.

mber systems including binary and octal are studied in this course. Logic
ed. Problems in computer design stress Boolean algebra as well as circuits
t register, and counters.

ugh the use of block diagrams and typical circuits. Transistor theory is
on of the atomic theory of matter and semiconductor physics. Transistor type
integrated into circuit analysis. Transistor stabilization in regard to
by temperature is stressed in circuit design. The theory of logic, memory
well as input-output devices is applied through experiments in computer

6349

ELECTRICAL ELECTRONIC DRAFTING - can be introduced at the home sch
ing course that stresses orthographic projection. The area center
ing block diagrams and electronic symbols and conventions. Schema
explain electrical-electronic theory in required laboratory experi
ment of working drawings needed to manufacture electronic equipmen

ELECTRICAL CONSTRUCTION - tools and techniques of the electrical
the construction of experimental models as they relate to student
integral part of all student activity.

Suggested Scheduling of Technical Electricity

ELECTRICITY

OUTLINE OF CONTENT

CONTENT	*TEAC*
I. Theory of current flow	
A. Construction of atom: electron flow	Use Bohr concept of si
B. Law of action between charges	Discuss law of charges
C. Concepts of voltage, current, and resistance	Define potential in te
	Define current as a fl
	Define resistance as t across a conductor t
	Mention units of curre
D. Conductors, semiconductors, and insulators	Discuss the nature of ductors. List examp
E. Sources of e.m.f.	Discuss qualitatively
1. Electromagnetic induction	
2. Chemical	
3. Thermal	
4. Piezoelectric	
5. Photovoltaic	
6. Static	
7. Other	

Note: Topics labeled "General Treatment" are to be covered in class prehensive examination.

Both theory and laboratory required.

6356

ELECTRICITY

OUTLINE OF CONTENT

	TEACHING SUGGESTIONS
electron	Use Bohr concept of simple atoms
charges	Discuss law of charges and electrostatic field concept.
current,	Define potential in terms of work.
	Define current as a flow of electric charge.
	Define resistance as the ratio of the potential difference across a conductor to the current in it.
	Mention units of current, voltage, and resistance.
tors, and	Discuss the nature of insulators, semiconductors, and conductors. List examples.
	Discuss qualitatively the various sources of e.m.f.
duction	

atment" are to be covered in class but shall not be tested on the com-

required.

6357

II. Circuits	
A. Ohm's law	Discuss Ohm's law. Solv
B. Series	State series and parall illustrative examples
C. Parallel	
D. Combinations	Stress concept of poten script notation.
E. Kirchhoff's laws	Give statement of laws
III. Measurements, standards, and tolerances	
A. Current	
1. Ammeter	Show how ammeter is con cautions in using an itatively.
2. Shunt calculations	
B. Voltage	
1. Voltmeter	Show how a voltmeter is
2. Multiplier calculations	Calculations of sensiti
3. Meter sensitivity and loading	Quantitative treatment
C. Resistance	
1. Voltmeter-ammeter method	Demonstrate resistance Point out that the p the circuit is impor readings.
2. Ohmmeter	Discuss both the series are required. Discu
a. Uses	
b. Circuitry	
3. Wheatstone bridge	Discuss the theory of several of its applica Work simple problems w

ELECTRICITY

Discuss Ohm's law. Solve problems.

State series and parallel circuit principles and give illustrative examples.

Stress concept of potential difference using double subscript notation.

Give statement of laws with simple illustrative examples.

s, and

Show how ammeter is connected in a circuit. Explain precautions in using an ammeter. Discuss Aryton shunt qualitatively.

ions

Show how a voltmeter is used in a circuit.

culations

Calculations of sensitivity required.

ity and

Quantitative treatment of loading is required.

ter method

Demonstrate resistance measurement by the V-A method. Point out that the proper location of the meters in the circuit is important to get accurate resistance readings.

Discuss both the series and shunt ohmmeters. Calculations are required. Discuss precautions in use of the ohmmeter.

dge

Discuss the theory of the Wheatstone Bridge. Point out several of its applications and its greater accuracy. Work simple problems with formula.

036859

D. Power	Define power.
1. Units - watts to horsepower	State that power c
2. Voltmeter-ammeter method	voltage across, Ohm's Law show t $W=I^2R$ and $W=\frac{E^2}{R}$
3. Wattmeter	Discuss the method
E. Energy	Define electrical multiplied by ti
IV Conductors	
A. Factors affecting resistance	Discuss the effect area, and length
B. Resistivity	
C. $R=\frac{Kl}{d^2}$	
D. Wire size	
a. Permissible voltage drops	Line drop calculat *Underwriter's* st made to local or
b. Use of wire tables	Use wire tables as conductors. Der
c. Calculation of wire size	Determine minimum which will satis tables to select
E. Temperature effect calculations	Determine resistar $\frac{R_1}{R_2} = \frac{234.5 + t_1}{234.5 + t_2}$ General treatme efficient of re mistor control

ELECTRICITY

	Define power.
o horsepower	State that power can be determined from the product of the voltage across, and the current through a circuit. Using Ohm's Law show that power can be expressed as $W=I^2R$ and $W=\frac{E^2}{R}$
er method	Discuss the method of connecting a wattmeter in a circuit.
	Define electrical energy. Explain that energy is power multiplied by time. Specify energy unit.
esistance	Discuss the effect of material composition, cross sectional area, and length on resistance at a constant temperature.
tage drops	Line drop calculations should use *National Board of Fire Underwriter's* standards. However, reference should also be made to local ordinances as required.
les	Use wire tables as sources of information about electrical conductors. Demonstrate use of wire gauge and micrometer.
wire size	Determine minimum circular mil area of copper conductor which will satisfy line drop specifications. Use wire tables to select available wire size.
calculations	Determine resistance or temperature (°C.) for copper, using: $\frac{R_1}{R_2} = \frac{234.5 + t_1}{234.5 + t_2}$ General treatment of materials having a negative coefficient of resistivity. Discuss their use in thermistor control devices.

V Magnetism	
A. Permanent magnets	Discuss the basic c
1. Properties	
a. Laws of interaction	
b. Lines of force	
c. Permeability and saturation	Discuss B-H curve.
2. Molecular theory	Use simple molecula uration, residual Discuss magnetizi concept of magnet
3. Materials	Indicate distinctio and paramagnetic
B. Electromagnets	
1. Direction and distribution of magnetic fields about current carrying conductors and coils	Discuss fields asso coil. Use right and coil.
2. Factors affecting strength	
a. Ampere turns	Discuss effect of c on magnet strengt
b. Permeability	Define permeability
VI Electromagnetic induction	
A. Faraday's law	Point out the facto duced e.m.f.
B. Lenz's law	Discuss the polarit
C. Induction coils	
1. Self-induction	Define self-inducti it.
2. Mutual-induction	Define mutual-induc it. Mention some

ELECTRICITY

Discuss the basic concepts of magnetism and magnetic fields.

action
e
and saturation

Discuss B-H curve.

Use simple molecular theory to explain permeability, saturation, residual magnetism, permanent magnets, etc. Discuss magnetizing, demagnetizing, shielding and the concept of magnetic domains.

Indicate distinction between ferromagnetic, diamagnetic, and paramagnetic materials.

tribution of
bout current
rs and coils

Discuss fields associated with straight conductor and with coil. Use right hand (current) rules for straight wire and coil.

strength

Discuss effect of changing turns, current, and core material on magnet strength.
Define permeability.

Point out the factors which determine the magnitude of induced e.m.f.

Discuss the polarity of induced self e.m.f.

Define self-induction and discuss the factors which affect it.

Define mutual-induction and discuss the factors which affect it. Mention some applications.

6363

VII Motor action	
A. Principle of operation	
1. Force on a conductor	Discuss the for electromagnet
2. Relative directions	Show the magnet current held Motor Rule to carrying cond
B. Applications	
1. D.C. Motors	Introduce conce inforced at a
2. D'Arsonval meter movement	Point out that precision spr inherently ar
VIII Alternating current	
A. Basic concepts	
1. Sine wave development	Discuss and ill press the fu
2. Frequency	Define frequen and period.
3. Maximum value	Define maximum
4. Effective value	Define effecti Point out th values for s
5. Average value	Define average geometric fi
6. Instantaneous value	Define instant
7. Effective resistance	Discuss the di resistance.

6364

ELECTRICITY

on

ctor — Discuss the force on a conductor carrying a current in an electromagnetic field.

ons — Show the magnetic field formation of a conductor carrying current held in a magnetic field. Explain the Left Hand Motor Rule to show the direction of motion of a current carrying conductor in a magnetic field.

Introduce concept of counter e.m.f. at this point to be reinforced at a later date.

movement — Point out that force on a conductor acts against a pair of precision springs. Mention that this type of meter is inherently an average reading device.

ment — Discuss and illustrate the generation of a sine wave. Express the function both in terms of degrees and radians.

Define frequency and periodic function. Relate frequency and period.

Define maximum and peak-to-peak values.

Define effective value (R.M.S.) in terms of heating effect. Point out the relationship between effective and maximum values for sine and square waves.

Define average value. Illustrate for sine wave and regular geometric figures as waves.

lue — Define instantaneous value and illustrate with problems.

ance — Discuss the difference between d.c. resistance and effective resistance.

8. True power (watts)	Define true power as e ably converted to an chanical.
9. Reactive power (vars)	Define reactive power between sources and
10. Apparent power (va)	Define apparent power and ammeter readings powers analytically
11. Power Factor	Define power factor as power. Relate the p phase angle of the c
B. Inductive circuits	
1. Factors affecting inductance	Define inductance. Di of inductance on geo
2. Calculation of inductive reactance	State that inductive r to current flow in a induction.
3. Phase relationships	Discuss the concept of Explain the phase la inductive circuit.
4. Mutual inductance	Discuss qualitatively.
C. Capacitive Circuits	Define capacitance in
1. Basic concepts	. the opposition . the storage of Define capacitor. D and discharging.
2. Factors affecting capacitance	Discuss qualitatively physical constructio of connecting capaci
3. Calculation of capacitive reactance	State that capacitive offered to current f
4. Phase relationships	Discuss the effect of between circuit volt

6366

ELECTRICITY

Define true power as electrical - power which is nonrecoverably converted to another form of power, e.g., heat, mechanical.

rs) Define reactive power as electrical power which oscillates between sources and load.

Define apparent power as the product of circuit voltmeter and ammeter readings. Relate true, reactive, and apparent powers analytically and in a phasor diagram.

Define power factor as the ratio between true and apparent power. Relate the power factor to the cosine of the phase angle of the circuit.

nductance Define inductance. Discuss qualitatively the dependence of inductance on geometry and composition of the coil.

ctive State that inductive reactance represents the opposition to current flow in a circuit due to the voltage of self-induction.

Discuss the concept of phase relationship (lead and lag). Explain the phase lag of current behind voltage in an inductive circuit.

Discuss qualitatively.

Define capacitance in terms of:

- the opposition to voltage change.
- the storage of charge.

Define capacitor. Discuss action of capacitor charging and discharging.

apacitance Discuss qualitatively the dependence of capacitance on the physical construction of the unit. Consider the effect of connecting capacitors in series and in parallel.

citive State that capacitive reactance represents the opposition offered to current flow by a capacitor.

Discuss the effect of capacitance on the phase relationship between circuit voltage and current.

6367

IX Single phase circuits	
A. Series circuits involving R, L, and C	
I. Voltage, current and power calculations	Introduce the opposition and graphic Thoroughly power, reac
2. Phasor diagrams	Develop phaso current.
B. Parallel circuits involving R, L, and C	
1. Voltage, current, and power calculations	Consider pure only single voltage, po
2. Phasor diagram	Develop phaso
C. Resonance	
1. Series	Define series resonant ci versus freq of circuit
2. Parallel	Define parall parallel re current ver (Q < 10) an sistance (i is to be ne
D. R-L and R-C time constants	Discuss the r across all which a ste
	Study the eff on the rise universal a emphasizing

368

olving R,

t and power

Introduce the concept of impedance as the total circuit opposition to current flow. Present both analytical and graphical solution for impedance (Phasor diagram). Thoroughly develop the concepts of true power, apparent power, reactive power, and power factor.

Develop phasor diagrams both for impedance and for voltage current.

nvolving

t, and
ons

Consider pure components only, and branches containing only single elements. Calculations of impedance, current, voltage, power, and power factor required.

Develop phasor diagrams for voltage and current.

Define series resonance. Discuss characteristics of series resonant circuits and curves of impedance and current versus frequency. Define bandwidth and Q, and the effect of circuit resistance and L/C ratio on bandwidth.

Define parallel resonance. Discuss characteristics of parallel resonant circuits and curves of impedance and current versus frequency. Distinguish between low Q ($Q < 10$) and high Q ($Q \geq 10$) circuits. Effect of resistance (in inductive branch) on resonant frequency is to be neglected.

nstants

Discuss the rise and decay of current through and voltage across all components in basic R-L and R-C circuits to which a step voltage is applied.

Study the effect of changing the value of circuit parameters on the rise and decay curves. Discuss the use of the universal ascending and [illegible]ing time constant curves, emphasizing values at one-and two-time constants.

6369

E. Power factor correction	Discuss the need for application of this
X Basic instruments	
A. D'Arsonval	Discuss construction
B. D'Arsonval with rectifier	Note applications,
C. Iron vane	sired, measured fre
D. Electrodynamometer	surable with instru
	etc.)
E. Use of	
1. Watt-hour meter	Stress use rather tha
2. Oscilloscope	accuracy, frequency
3. Frequency meter	
4. VOM	
5. VTVM	
6. Digital readout meters	
XI Overload protection	
A. Fuse	Give general treatmen fuses and indicate briefly time-delay types.
B. Circuit breaker	Introduce the general principle of operati
	As an optional feature quick-break, trip fr pressed air and oil.
C. Semiconductor	Discuss the applicatio of circuits or devic the protection of me

6370

ELECTRICITY

Discuss the need for power factor correction and illustrate application of this concept with examples.

Discuss construction and basic operation of instruments. Note applications, considering relative precision desired, measured frequency, sensitivity, quantity measurable with instrument (e.g., RMS or average, ac or dc etc.)

Stress use rather than theory of operation. Consider accuracy, frequency response, loading effect, etc.

Give general treatment of low-voltage plug and cartridge fuses and indicate voltage and current ranges. Discuss briefly time-delay fuses made in both plug and cartridge types.

Introduce the general idea of circuit breakers, including principle of operation, and, uses in preference to fuses.

As an optional feature briefly discuss features such as quick-break, trip free, and types such as magnetic, compressed air and oil.

Discuss the application of semiconductors in the protection of circuits or devices against overloads for example, the protection of meters with diodes

6371

XII D.C. generators	
A. Construction and basic theory	Describe dynamo c lying the gener sider the actio relating termin
1. Separately excited	
2. Self-excited (shunt)	
B. Factors affecting build-up	Discuss the facto shunt generator
C. Commutation (general treatment)	Discuss qualitati mutation, menti
D. Characteristics of generators	
1. Magnetization curve	Briefly discuss m
2. External characteristics	Consider the exte generators, and change of termi ulation.
3. Voltage control	Discuss method fo generators.
XIII D.C. motors	
A. Theory	Discuss the basic torque in a d.c counter electro lating terminal
B. Characteristics	Discuss the opera shunt, and comp and torque. Li motors.
C. Starting requirements	Discuss the start basic starting
D. Operation	Discuss the opera motors. Consid trolling speed, tion.

6372

theory	Describe dynamo construction, and the basic concepts underlying the generation of a voltage in the armature. Consider the action of the commutator. Develop the equation relating terminal voltage and generated voltage.
-up	Discuss the factors affecting the build-up of a self-excited shunt generator.
eatment)	Discuss qualitatively the problems surrounding proper commutation, mentioning the need for interpoles.
rators	
	Briefly discuss magnetization curve.
stics	Consider the external characteristics of shunt and compound generators, and discuss briefly the factors affecting the change of terminal voltage with load. Define voltage regulation.
	Discuss method for controlling the terminal voltage of d.c. generators.
	Discuss the basic concepts underlying the development of torque in a d.c. motor. Consider the generation of a counter electromotive force and develop the equation relating terminal voltage and CEMF.
	Discuss the operating characteristics of the d.c. series, shunt, and compound motors considering speed regulation and torque. List applications of the various types of motors.
	Discuss the starting of d.c. motors and briefly consider basic starting equipment.
	Discuss the operation of d.c. series, shunt, and compound motors. Consider reversing direction of rotation, controlling speed, and precautions to be observed in operation.

0T63373

XIV Three-phase systems.	
A. Voltage, current, and power	Discuss the adv rent and volt sent the form
1. Wye	
2. Delta	
B. Three-phase, four-wire transmission and distribution system.	Discuss the app to generators
C. Measuring power in a three-phase system	Point out the a measurement o readings unde
XV Alternators	
A. Construction	Discuss the typ
B. General principles of operation (general treatment)	Discuss the gen speed and num
C. Applications	Consider the us
XVI Transformer principles	
A. Transformer action	Discuss how the output.
B. Current and voltage	Define the phra directly prop versely propo
C. Polarities and connections	Discuss subtract concepts unde sidering pola tribution of capacity conn former connect (a) wye (b) delt (c) wye (d) delt (e) oper

6374

t, and power	Discuss the advantages of poly-phase systems. Show the current and voltage relationships in both connections. Present the formula for calculation of power.
ur-wire trans- tribution system.	Discuss the application of this type of connection as applied to generators and transformers.
in a three-	Point out the advantages of the two wattmeter method in the measurement of three-phase power. Discuss the wattmeter readings under resistive-reactive loads.
	Discuss the types of construction.
les of ral treatment)	Discuss the generation of e.m.f. and show the effects of speed and number of poles on frequency.
	Consider the use of alternators in the automotive industry.
les	
ion	Discuss how the power input adjusts to changes in power output.
tage	Define the phrase volt/turn. Explain that the voltages are directly proportional to turns ratio, and currents are inversely proportional to the turns ratio.
connections	Discuss subtractive and additive polarities. Discuss the concepts underlying the paralleling of transformers, considering polarity and voltage. Mention the unequal distribution of loads between two transformers of different capacity connected in parallel. Show three-phase transformer connections with diagrams of: (a) wye - wye (b) delta - wye (c) wye - delta (d) delta - delta (e) open delta

6376

93

ELECTRICITY

Discuss the use of instrument transformers in measurement as part of control systems and as isolation devices. Discuss the current transformer (C.T.) as a low-capacity, precision current step-down transformer. Demonstrate correct connections, and stress safety aspects of grounding and danger of allowing secondary to become open-circuited. Calculate line currents from a meter reading.

Note: A possible enrichment for some classes might be the use of P.T. and C.T. with a voltmeter and the use of obtained information in calculating power factor, and volt-ampere-reactive (vars).

Discuss the potential transformer (P.T.) as a low capacity, precision, voltage stepdown transformer. Demonstrate correct connection to a high voltage line, and the safety aspects of the grounded secondary. Calculate line voltage from secondary voltmeter reading and P.T. ratio. Phasing should involve correct use of standard markings (H and X) and dot.

ormer

Discuss construction and basic principles. Include diagrams illustrating current distribution and voltages in both step-up and step-down connections.

Qualitatively discuss transformer losses.

t motors

luction

Discuss the construction and important characteristics of the polyphase induction motor (essentially constant speed, little maintenance required). Develop the principles of operation, elaborating on the rotating magnetic field, transformer action, and slip. Mention the method of reversing direction of rotation.

Demonstrate and discuss common types:universal, split-phase, repulsion, shaded pole, capacitor start, and synchronous.

6374
6377

XVIII Grounding	Discuss grounding as a safety electrical circuits. Consi possible injury when workin consider use of ground as a
XIX Batteries (general treatment)	Demonstrate factors necessary dissimilar metals and elect
A. Types	Display different sizes of co mercuric oxide-zinc). Disc binations of cells. Display common storage cells(lead-acid).

XX Relays	
A. Operation	Consider relays with regard t (a) Basic operation (b) Power (c) Coil ratings
B. Characteristics	Discuss the operate and relea (a) Definition (b) DC relay (1) operating ti (2) mechanical i (c) AC relay (1) phase displa (2) operating ti
C. Types	Discuss the factors to consid

1868 6378

ELECTRICITY

Discuss grounding as a safety and protective feature in electrical circuits. Consider methods for minimizing possible injury when working in electrical circuits. Also consider use of ground as a point of reference.

treatment)

Demonstrate factors necessary for simple voltaic action: dissimilar metals and electrolyte.

Display different sizes of common dry cells (carbon-zinc, mercuric oxide-zinc). Discuss series and parallel combinations of cells.

Display common storage cells(nickel-iron, nickel-cadmium, lead-acid).

and care

Compare batteries as to applications, cell voltage, electrolyte, charge and discharge rates, and general maintenance. Demonstrate and discuss in detail, the care, maintenance and safety considerations in the use of lead-acid storage batteries. Consider the internal resistance of a cell and ampere-hour rating.

Consider relays with regard to:

(a) Basic operation
(b) Power
(c) Coil ratings

Discuss the operate and release times of relays:

(a) Definition
(b) DC relay
    (1) operating times
    (2) mechanical inertia
(c) AC relay
    (1) phase displacement in magnetic flux
    (2) operating times

Discuss the factors to consider in selecting a relay.

	Indicate that the material ly charged, since the tot equal.
b. P-type	Define an acceptor impurity 3 electrons.
	Inform the students that ty doping are boron, aluminu types.
	Illustrate how the acceptor structure leaving holes. P-type but is also neutra equal numbers of electron of minority carriers. Me incident light variations

6383
6384

r Define a semiconductor as a material whose resistance falls between a conductor and insulator. Indicate that insulators have 5 to 8 valence electrons, conductors have 1 to 3, semiconductors 4.

List silicon and germanium as the types of semiconductor materials most prevalent today.

Describe lattice structure of pure germanium or silicon and covalent bonds.

Establish the fact that impurity atoms must be added to create a more useful material.

Define a donor impurity as one whose valence ring contains 5 electrons. Inform the students that typical donor impurities are arsenic and antimony. Mention that these are called pentavalent impurities. Indicate that the semiconductor materials containing controlled amounts of impurities are referred to as "doped." Illustrate how the donor impurity atom fits into the lattice structure leaving one free electron.

Emphasize that this material is defined as N-type since there are electrons outside the lattice structure.

Indicate that the material is electrically neutral, not negatively charged, since the total number of electrons and protons are equal.

Define an acceptor impurity as one with a valence ring containing 3 electrons.

Inform the students that typical acceptor impurities used for doping are boron, aluminum, indium, and gallium; all trivalent types.

Illustrate how the acceptor impurities atoms fit into the lattice structure leaving holes. Mention that this material is called P-type but is also neutral from a charge standpoint as it has equal numbers of electrons and protons. Introduce the concept of minority carriers. Mention the effect of temperature and incident light variations on available current carriers.

6385

B. Electron emission	
1. Thermionic emission.	Discuss the energy for e Explain how heat suppl from the attraction of used. Discuss high ef
2. Photoelectric emission	Compare light with heat electrons are released
	List the more common typ
	State that the number of material is proportion
3. Secondary emission	Define secondary emissio
	Mention that secondary e times has a negligible
II Electronic devices	
A. Diodes	Discuss the formation of N-Type semiconductor. and the formation of t
1. Semiconductor	
a. P-N junction	
b. Forward bias	Define forward bias and to its effect. Discus need for current limit
c. Reverse bias	Define reverse bias and ity carriers. Discuss Voltage (PIV) ratings
d. Characteristic curve	Present the volt-ampere conductor diode. Disc characteristic curve. can be calculated. Di resistance. Discuss t germanium and silicon
e. Temperature effects	Discuss the effect of te current carriers. Men of silicon diodes.

6386

iscuss the energy for emission. Define work function. Explain how heat supplies energy to the electrons to free them from the attraction of the nucleus. List the types of materials used. Discuss high efficiency emitters.

ompare light with heat as a form of energy. Explain how valence electrons are released by light.

ist the more common types of photoelectric materials.

tate that the number of electrons released from a photoelectric material is proportional to the intensity of the incident light.

efine secondary emission.

ention that secondary emission occurs in vacuum tubes and at times has a negligible effect.

iscuss the formation of a junction diode by joining P-Type and N-Type semiconductor. Mention the initial flow of electrons and the formation of the "depletion region."

efine forward bias and explain current flow within the diode due to its effect. Discuss the thermal breakdown effect and the need for current limiting resistors.

efine reverse bias and explain its effect on majority and minority carriers. Discuss the zener potential. Define Peak Inverse Voltage (PIV) ratings and factors affecting it.

resent the volt-ampere characteristic curve of a typical semiconductor diode. Discuss leakage current and its effect on the characteristic curve. Show how forward and reverse resistance can be calculated. Discuss the ratio of reverse to forward resistance. Discuss typical forward and reverse resistance of germanium and silicon diodes.

Discuss the effect of temperature on the quantity of available current carriers. Mention the higher temperature capabilities of silicon diodes.

8387

f. Zener diode	Show the characteristic cu power dissipation and se circuit applications.
g. Special types (general treatment)	Mention special types of d variable resistance, pho
2. Vacuum tube (general treatment)	Explain the operation of t limitions due to the gla quirements.
a. Effect of filament temperature on plate current	Review the effect of heat plate current and voltag
b. Effect of plate voltage on plate current	Show the relationship betw the characteristic curve
d. Construction	Discuss construction and l
B. Active devices	
1. Physical characteristics (general treatment)	Discuss the physical chara containers used with sem
a. Containers	Note the need for heat sin characteristics of some.
	Compare the physical const ductor devices.

d. Symbolic representation	Require that the student b tion of the NPN and PNP rectifier, the triode, t
2. Theory of operation	Qualitatively discuss the they pass through the tr biased junction and the
	Discuss how current, volta

ELECTRONICS

Show the characteristic curve of a zener diode. Explain maximum power dissipation and selection of limiting resistor. Discuss circuit applications.

(general Mention special types of diodes such as variable capacitance, variable resistance, photoconductive, thermistor, etc.

ral Explain the operation of the vacuum tube diode. Mention its limitions due to the glass envelope and filament voltage requirements.

ament
n plate Review the effect of heat on cathode emission and its relation to plate current and voltage.

te voltage Show the relationship between plate current. Define and present
ent the characteristic curves for the diode.

Discuss construction and lead arrangement.

ristics Discuss the physical characteristics of a few of the most popular
t) containers used with semiconductor devices. e.g. TO-1, TO-3

Note the need for heat sinks to dissipate heat and the physical characteristics of some.

Compare the physical construction of vacuum tubes and semiconductor devices.

osition Discuss the transistor as two P-N diodes back to back.

Note the origin of the word transistor from transfer - resistor.

Describe the pin and lead arrangement of active devices.

esenta- Require that the student be familiar with the symbolic representation of the NPN and PNP transistor, the silicon controlled rectifier, the triode, tetrode, and pentode vacuum tubes.

on Qualitatively discuss the paths taken by holes and electrons as they pass through the transistor. Note the effect of the forward biased junction and the reverse biased junction.

Discuss how current, voltage and power gains are determined.

6389 6389

Mention how electron fl
tubes.

Compare the imput resis

Discuss photo-voltaic a

3. Characteristic curves

a. Output curves

b. Input curves

Input curves are not ne
theoretical infinite

Impart to the student t
input resistance of t

Make use of input curve
current.

ELECTRONICS

Mention how electron flow is controlled by the grid in vacuum tubes.

Compare the input resistance of semiconductors and vacuum tubes.

Discuss photo-voltaic action.

Input curves are not necessary for vacuum tubes because of the theoretical infinite input resistance.

Impart to the student that the slope of the input curve is the input resistance of the device.

Make use of input curves to relate input voltage and input current.

6391
SEED

4. Load line

   a. Intercept method of construction

   b. Point slope method of construction

5. Bias and quiescent point location — Discuss the function of bias operating point on the loa a device to the linear por and saturation.

6. Equivalent circuits — Develop the representation c impedance (Thevenin) equiv (Norton) equivalent circui

   a. Voltage equivalent (Thevenin)

lecat 6392

Discuss the function of bias with respect to location of quiescent operating point on the load line. Note the need for biasing a device to the linear portion of operation, avoiding cut off and saturation.

Develop the representation of any two terminal device by a voltage - impedance (Thevenin) equivalent circuit or current - impedance (Norton) equivalent circuit.

b. Current equivalent

Consider 3 terminal d
two terminals and t
Norton equivalents.

c. h-parameter equivalent

Develop the h-paramet
lent of the input p
port. Limit the di
h's.

Discuss h_{ie} as the in
output resistance,

d. Vacuum tube equivalent circuit

Relate the Thevenin e
cuits to vacuum tub

6394

quivalent

Consider 3 terminal devices as two-port networks, each having two terminals and thereby representable by Thevenin and/or Norton equivalents.

er
t

Develop the h-parameter equivalent circuit as Thevenin equivalent of the input port and a Norton equivalent of the output port. Limit the discussion of h parameters to common emitter h's.

Discuss h_{ie} as the input resistance of transistor, $\frac{1}{h_{oe}}$ as the output resistance, and h_{fe} as the short circuit current gain.

ube
nt circuit

Relate the Thevenin equivalent and the Norton equivalent circuits to vacuum tubes.

6395

7. Parameters

a. h parameters

Define:

$$h_{ie} = \frac{\Delta v_{be}}{\Delta i_b} \Bigg|_{\Delta v_c}$$

$$h_{oe} = \frac{\Delta i_c}{\Delta v_{ce}} \Bigg|_{\Delta i_b}$$

$$h_{fe} = \frac{\Delta i_c}{\Delta i_b} \Bigg|_{\Delta v_c}$$

Determine from charac

6396

Define:

$$h_{ie} = \frac{\Delta v_{be}}{\Delta i_b}\Bigg|_{\Delta v_{ce} = o}$$

$$h_{oe} = \frac{\Delta i_c}{\Delta v_{ce}}\Bigg|_{\Delta i_b = o}$$

$$h_{fe} = \frac{\Delta i_c}{\Delta i_b}\Bigg|_{\Delta v_{ce} = o}$$

Determine from characteristic curves.

6397

h_{re} should be discussed and then quickly dropped since under most conditions the effect of $h_{re}\ v_2$ is small enough to be ignored.

Simplified h parameter equivalent circuit of the transistor.

Define

$$r_p = \frac{\Delta e_b}{\Delta i_p} \Bigg|_{\Delta e_g = o}$$

$$u = \frac{\Delta e_b}{\Delta e_g} \Bigg|_{\Delta i_p = o}$$

0003 6399

$$gm = \frac{\Delta i_p}{\Delta e_g} \Bigg|_{\Delta e_b = o}$$

ELECTRONICS

$$gm = \frac{\Delta i_p}{\Delta e_g} \Bigg|_{\Delta e_b = o}$$

6401 6398

III Basic circuits

A. Rectifiers

1. Concept of rectification — Instill the concept of re current flow.

2. Circuits — Explain the functioning o one-half cycle and clos

a. Half-wave — The output waveshape of t to be the sum of a DC 1 quency being equal to 1

$$E_{DC_{HW}} = \frac{E_{PK}}{\pi}$$

$$E_{ripple_{P-P}} = E_{PK}$$

Given the current and vol the required transforme the diode (also vice-ve type. Discuss the need even when a step-up or

Indicate that there is a AC-DC radios and TV's.

b. Full-wave

(1) Center-tapped Transformer type — Indicate that by using tw a circuit can be develo halves of the input cyc

6402

tification

Instill the concept of rectification providing a unidirectional current flow.

Explain the functioning of a diode as a switch which is open for one-half cycle and closed for the other one-half cycle.

The output waveshape of the half wave rectifier can be considered to be the sum of a DC level and a ripple component, ripple frequency being equal to line frequency.

$$E_{DC_{HW}} = \frac{E_{PK}}{\pi} \qquad I_{DC_{HW}} = \frac{I_{PK}}{\pi}$$

$$E_{ripple_{P-P}} = E_{PK} \qquad I_{ripple_{P-P}} = I_{PK}$$

Given the current and voltage requirements of the load, determine the required transformer turns ratio and required PIV rating of the diode (also vice-versa). Have students do problems of this type. Discuss the need for a transformer for isolation purposes even when a step-up or step-down of line voltage is not necessary.

Indicate that there is a shock hazard from transformerless and AC-DC radios and TV's.

er-tapped

sformer type

Indicate that by using two diodes and a center-tapped transformer a circuit can be developed which allows conduction during both halves of the input cycle.

6403
6404
02

$E_{DC} = \frac{2E_{PK}}{\pi}$ I_D

$E_{ripple\ P-P} = E_{PK}$ $I_{r\ P}$

Ripple frequency is twice 1
the above.

Indicate that the peak outp
from the center tap to on

Determine PIV and note that
rectifier.

(2) Bridge type

Elaborate on the need for a
wave rectifier circuit an
ing a transformer when op
with a bridge-type recti

Indicate that the output vo
ary voltage for the bridg

6403
6404

$$I_{AVG\ PER\ DIODLE} = \frac{1}{2} I_{DC\ OUTPUT}$$

$$E_{DC} = \frac{2E_{PK}}{\pi} \qquad I_{DC} = \frac{2I_{PK}}{\pi}$$

$$E_{ripple\ P-P} = E_{PK} \qquad I_{ripple\ P-P} = I_{PK}$$

Ripple frequency is twice line frequency. Assign problems using the above.

Indicate that the peak output voltage is dependent upon the voltage from the center tap to one outside leg of the transformer.

Determine PIV and note that it is twice that for the half-wave rectifier.

Elaborate on the need for a center-tapped transformer for the full wave rectifier circuit and establish the advantage of not needing a transformer when operating directly from the power line with a bridge-type rectifier circuit.

Indicate that the output voltage is dependent on the full secondary voltage for the bridge rectifier.

SOAS 6405

Assign problems.

Discuss PIV and re

$I_{AVG/diode} = \frac{1}{2} I_{D}$

c. Voltage-doubler

Study the operatio that the DC outp peak value of th

$PIV_{D_1} = 2E_{PK_{IN}}$

$PIV_{D2} = 2E_{PK_{IN}}$

f ripple = f input

Assign problems

The half-wave volt Doubler".

3. Filter

Develop the need f

a. Types

(1) Capacitor

Develop RC charge circuit in light

Construct the outp

6406

Assign problems.

Discuss PIV and required current rating of the diodes.

$I_{AVG/diode} = \frac{1}{2} I_{DC\ out}$

er

Study the operation of the half-wave voltage doubler indicating that the DC output voltage is equal to approximately twice the peak value of the input voltage

$PIV_{D_1} = 2E_{PK_{IN}}$

$PIV_{D2} = 2E_{PK_{IN}}$

f ripple = f input

Assign problems

The half-wave voltage doubler is also known as the "Cascade Voltage Doubler".

Develop the need for filtering the output of a rectifier circuit.

tor

Develop RC charge and discharge curves. Study the Capacitor filter circuit in light of the RC discharge curve.

$E_{dc} = \frac{2fRC}{2fRC+1} E_{pk}$

$I_{dc} = \frac{F_{dc}}{R}$

Construct the output waveshape given E_{PK} and RC

6407

(2) RC π

4. Regulation

Define per cent regulation:

$$\frac{E_{no\ load} - E_{full\ load}}{E_{full\ load}} \times 100 =$$

Have students determine per
power supply circuit.

Discuss the need for good re
in various parts of the ba

5. Controlled rectifiers

a. Silicon controlled

Describe the SCR as a four l
device. Show that forward
one of the junctions to be

control to adjust the firi
conduction time.

Describe the effect of AC on
that both the grid and pla
and E_p have to be of the
neously for the thyratron

6408
5058

Define per cent regulation:

$$\frac{E_{no\ load} - E_{full\ load}}{E_{full\ load}} \times 100 = \%\ regulation$$

Have students determine per cent regulation of a given particular power supply circuit.

Discuss the need for good regulation and emphasize the voltage drop in various parts of the basic rectifier circuit. $E_{out} = E_{dc} - E_{drop}$

s

rolled Describe the SCR as a four layer, three junction, semiconductor device. Show that forward bias from anode to cathode will cause one of the junctions to be reverse biased. Discuss the function of the gate in causing current to flow across the reverse biased junction.

Explain gate-trigger current and show that conduction once started is independent of gate current. Show how the device can be turned off by decreasing anode-to-cathode bias or by a reverse gate current. Present schematic symbol.

Explain AC triggering in terms of the charging current of the reverse biased junction capacitance.

Mention turn-on and turn-off time.

Describe the thyratron and show construction. Explain the operation and present characteristic curves. Mention the use of neon and argon to eliminate the effect of temperature on firing potential.

Explain the effect of the grid on firing and its lack of control in extinguishing the arc. Emphasize the idea of variable grid control to adjust the firing point and thus control the plate conduction time.

Describe the effect of AC on the plate of the thyratron. Point out that both the grid and plate are fed with AC. Show how both E_g and E_p have to be of the correct polarity and amplitude simultaneously for the thyratron to fire.

3043
6409

B. Amplifiers

1. Voltage amplifiers

a. Load line

(1) Static
(2) Dynamic

Explain that a coupling
component of the plate

Assign problems in which
static and dynamic loa

b. Wave forms

c. Voltage gain

Define voltage gain.

Determination of voltage

Develop voltage gain for
band.

d. Current gain

Define current gain.

Determination of current
mid-band.

6410 6413

fiers Explain that a coupling capacitor may be needed to block the DC component of the plate signal.

ic
nic

Assign problems in which the student is required to plot both static and dynamic load lines.

s

ain Define voltage gain.

Determination of voltage gain from input and output waveshapes.

Develop voltage gain formulas from equivalent circuit at mid-band.

ain Define current gain.

Determination of current gain from input and output waveshapes at mid-band.

$$P_{out} = \frac{Eout\ p\text{-}p \times Iout\ p\text{-}p}{8}$$

$$\text{Efficiency} = \frac{P_{out} \times 100}{P_{InDC}}$$

Discuss the advantages of the different classes of operation.

Analysis of two and three input gates in terms of instantaneous voltage values, bias conditions, and logic function. Stress that only two input levels are permitted. Explain that selection of voltage coresponding to "1" level determines positive or negative logic.

Explain the logic function of the invertor. Review phase inversion in the common-emitter amplifier. Introduce clamp voltage to reduce forbidden zone. Develop the graph of output versus input voltage.

Analysis of two input NAND and NOR gates developed as a combination of AND, OR, and Invertor. Explain that NAND and NOR are basic logic blocks, and that AND and OR can be constructed from them. Mention "direct coupled transistor logic."

6421

IV Cascade amplifiers	
A. Coupling	Explain the function of the coupling capaci high-and low-frequencies. Study DC and A blems in which it is necessary to plot bo
1. RC	
2. Transformer	Discuss the transformer-coupled amplifier, ing AC and DC load lines.
	Solve problems to determine the gain of tra fiers. Allow for transformer turns-ratio gain).
3. Push-pull	Develop the push-pull amplifiers.
	Discuss crossover distortion and its prevent power efficiency.
	Discuss limitations imposed by transformers.
4. Phase inversion	Discuss phase invertors qualitatively. Sho to replace the input transformer in the p
5. Complementary symmetry	Discuss complementary symmetry as a means o sistor circuits. Show how this technique pull amplifier.
6. Tuned transformer	Mention applications in RF, IF, and video a
a. Q of coil	Define the Q of a resonant circuit as $Q = \frac{XL}{R}$ parallel resonance. Mention single, doub amplifiers.
b. Selectivity and band width	Define band width. Show that it may be cal Discuss half-power points, upper and lowe Mention peaking techniques for tuned ampli
B. Amplifier decoupling	Discuss the need for power supply decoupling
C. Frequency response	Emphasize the fact that an amplifier respond medium, and high frequencies. Discuss the high and low frequency response.
	Discuss phase distortion qualitatively.
	Solve problems relating to amplifier frequen

6422

Explain the function of the coupling capacitor and its effect at high-and low-frequencies. Study DC and AC load lines. Solve problems in which it is necessary to plot both load lines.

Discuss the transformer-coupled amplifier, quantitatively developing AC and DC load lines.

Solve problems to determine the gain of transformer coupled amplifiers. Allow for transformer turns-ratio in calculating overall gain).

Develop the push-pull amplifiers.

Discuss crossover distortion and its prevention. Mention increased power efficiency.

Discuss limitations imposed by transformers.

Discuss phase invertors qualitatively. Show how they may be used to replace the input transformer in the push-pull amplifier.

etry Discuss complementary symmetry as a means of direct coupling transistor circuits. Show how this technique may be used in the push-pull amplifier.

Mention applications in RF, IF, and video amplifiers.

Define the Q of a resonant circuit as $Q = \frac{XL}{R}$. Review series and parallel resonance. Mention single, double, and stagger-tuned amplifiers.

Define band width. Show that it may be calculated as equal to $\frac{fo}{Q}$. Discuss half-power points, upper and lower cutoff frequencies. Mention peaking techniques for tuned amplifiers.

Discuss the need for power supply decoupling in cascade amplifiers.

Emphasize the fact that an amplifier responds differently at low, medium, and high frequencies. Discuss the factors effecting high and low frequency response.

Discuss phase distortion qualitatively.

Solve problems relating to amplifier frequency response.

6423

V Feedback	Define the term "feedback" as output energy of a circuit system.
	(It is not necessary to limit
A. Effect on amplifier gain	
1. Gain formula	Develop the formula for the g $A' = \frac{A}{1-AB}$
2. Negative feedback	Note the effect on A' of (AB
3. Positive feedback	Note the effect on A' of (AB
B. Effect on distortion	Discuss the effect of feedbac $D' = \frac{D}{1-AB}$
	Assign problems which make us mulas.
C. Oscillation	Discuss the possibility of th of input).
1. Sustained	
2. Undesired	Relate this to AB = 1 at an a the conditions for self sus teria).
	Reinforce the concept of osci solve problems in which the fier to an oscillator by in
D. Oscillator circuits	Develop the astable multivib circuits which provides an
1. Astable multivibrator	$AB = 1\angle 0^{\circ}$
	Require that the student det given the values of R's an when given pulse repetitio

ELECTRONICS

Define the term "feedback" as the returning of a sample of the output energy of a circuit to a prior point in that circuit or system.

(It is not necessary to limit the system to an electronic one.)

gain

Develop the formula for the gain of an amplifier with feedback.

$$A' = \frac{A}{1-AB}$$

k Note the effect on A' of (AB) being negative.

k Note the effect on A' of (AB) Being positive.

Discuss the effect of feedback on distortion.

$$D' = \frac{D}{1-AB}$$

Assign problems which make use of the gain and the distortion formulas.

Discuss the possibility of the system being self-excited (removal of input).

Relate this to AB = 1 at an angle of zero or multiple of 360 degrees, the conditions for self sustained oscillation (Barkhausen criteria).

Reinforce the concept of oscillation conditions by having students solve problems in which they are asked to convert a given amplifier to an oscillator by introducing a feedback loop.

Develop the astable multivibrator as one of the simplest electronic circuits which provides an

rator

$$AB = 1\angle 0^{\circ}$$

Require that the student determine the pulse repetition rate when given the values of R's and C's. Also, determine R's or C's when given pulse repetition rate.

ELECTRONICS

Introduce the problem of predetermining the frequency of oscillation and therefore a need for series and parallel resonant circuits.

Have students determine the resonant frequency of series and parallel resonant circuits. Given frequency requirements and L or C, determine L or C. Given L and C, determine the resonant frequency of the circuit.

Discuss the use of crystals as frequency and waveshape determining units in oscillators.

Explain the operation of an RC phase shift oscillator. Solve for frequency and/or component values.

Discuss the operation of the Wien bridge oscillator.

Discuss the use of high frequency carrier signals to transport low-frequency intelligence.

Define and develop the following terms:

carrier
modulation
modulating signal
modulated wave
modulator

Show that the major output frequencies are:

f carrier
f carrier + f modulation
f carrier - f modulation
